# THE ARCHITECT

## A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

### THE WEEK.

It was decided on Monday that the Liverpool Jubilee Memorial is to take the form of a clock tower, which is to be erected near University College, and to be designed by Mr. WATERHOUSE, R.A. According to the architect's description the base, up to 5 feet 6 inches from the pavement, is to be of red granite, and all visible parts above of terra-cotta and of Ruabon red brick. The spire and the roofs of the spirelets at the angles will be covered with lead, as being more monumental than tiles, and to prevent all chances of accident to passers-by. The tower is 24 feet square and 160 feet high from the street. It is 102 feet from the street to the centre of the dials, which are 10 feet 5 inches diameter. Mr. WATERHOUSE also proposes that the dials and the band bearing the legend which would go round the tower below the cornice should be in gold mosaic. The tower will be connected with the engineering department of the college by buildings which are to be erected. Originally it was contemplated that the tower should stand alone in some part of Liverpool where it would be useful, but sufficient subscriptions were not received, and a site adjoining the college was thereupon adopted.

The following officers were elected at the annual meeting of the Dundee Institute of Architecture:—President, T. S. ROBERTSON; vice-president, CHARLES OWER; ordinary members of Council, ALEXANDER HUTCHESON and WILLIAM MACKISON; associate members of Council, ROBERT SMITH and WILLIAM STEPHENSON; honorary secretary, LESLIE OWER; honorary treasurer, J. J. HENDERSON; auditors, G. A. HARRIS and JAMES BRUCE. The retiring president, Mr. R. BLACKADDER, in addressing the meeting, said that members were increasing in numbers, but less interest was taken during the year in the competitions, although more prizes were obtainable. The treasurer's balance amounts to 44*l.* 3*s.* 2*d.*

The competition for the model village at Aintree, near Liverpool, was decided on Saturday. Out of the eighty-five designs, two by Messrs. WILLIAM SUGDEN & SON, of Leek, and Mr. FRANK MAY, of Manchester, were considered the best, and to each a prize of fifty guineas was awarded. The second prize was accordingly withheld. Messrs. WILLINK & THICKESSE obtained the third prize. Nothing appears to be said about entrusting the works to the successful architects. For the moderate sum of 126*l.*, the projector of the model village has secured suggestions for laying out his property from a large number of experts; he has also obtained the admiration of his enterprise throughout the country. After so much benefit, who will be able to say a word against the competition system? In course of time we expect to see many similar utilisations of it.

The Association of Municipal and Sanitary Engineers and Surveyors will meet at the Institution of Civil Engineers on Thursday, Friday, and Saturday in next week. The following papers will be read:—"Back Streets, Lanes, and Alleys," H. U. MCKIE, Carlisle; "Average Meter System," G. R. STRACHAN, Chelsea; "Ten Years' Experience of the

Shone System," Lieut.-Col. JONES, V.C., Wrexham; "Electric Fire Alarms," T. DE C. MEADE, Hornsey; "Water Supply," W. SANTO CRIMP, Wimbledon; "The Purification of Sewage by Electricity, Notes and Experiments," W. WEBSTER, F.C.S. There will be visits to the Houses of Parliament in order to see the new drainage works, Messrs. JENNINGS's sanitary works at Lambeth, the Lucigen and Oxygen Works, Westminster, the Greenwich ferry, and the outfall works at Barking.

THE Bill introduced by Mr. WHITMORE, Sir A. BORTHWICK, and other members, in order to restrict the height of buildings in the Metropolis is evidently inspired by the recent attempt to surpass the highest houses in Knightsbridge. According to the first clause, it is proposed that no building except a church or chapel shall be erected in any street, thoroughfare, or place, of less width than 60 feet, which shall exceed 60 feet in height, and no building except a church or chapel shall be erected in any street, thoroughfare, or place of greater width than 60 feet, which shall exceed in height the width of the said street, thoroughfare, or place, without the consent in writing of the Secretary of State, before the election of the London County Council, and after the election of the London County Council without the consent in writing of the said council, nor shall the height of any building so erected be at an time subsequently increased so as to exceed such width without such consent. According to the second clause, any person failing to inform the district surveyor, or other officer of the Metropolitan Board of Works, or of the London County Council, appointed to carry out the Metropolitan Buildings Acts, of his intention to erect any building exceeding in height 60 feet shall be liable to the penalties contained in 25 and 26 Vic., cap. 102, sec. 85, to be recovered by summary proceeding. It is to be the duty of the district surveyor, or such other officer of the Metropolitan Board of Works, or of the London County Council, to inform the Secretary of State of any building intended to be erected contravening the provisions of this Act. The Act is to apply to the Metropolis as defined by the Metropolis Management Act, 1855.

AN important decision in regard to the responsibility of valuers has been given by Mr. Justice CHITTY. In 1883 an application was made to solicitors in Nottingham for a loan of 2,000*l.* They instructed a firm of auctioneers and valuers to examine the premises offered as security, and received a report in which the valuation was put down at 3,000*l.* On the faith of that advice a sum of 2,045*l.* was lent. After a time, as the borrower was in arrears with his interest, the property was put up for auction. The highest bid was 680*l.* Afterwards the property was valued by two experts. One said it was worth 1,200*l.*, and the other 1,100*l.* The Judge thought there was no reasonable cause for giving the value as 3,000*l.*, and the statement seemed to be reckless. There was no ground for supposing that the defendants were in any way gainers by giving so high a valuation, but they were held by his lordship as liable for negligence. Judgment was, therefore, given for the plaintiffs, with an order for an inquiry into the damages sustained through the negligence and misrepresentation of the defendants.

## ART AND HISTORY.\*

IT might be supposed from the majority of books which pass for histories in England, that art—taking the word in its widest sense—was of no importance in life, and can be passed over as if it were of no more importance than the games of children. Instead of looking at all things impartially from high Olympus, the Muse of History seems to be no more than a waiting woman in a palace or a council chamber, and is indifferent to all who are not grandees or their dependants. Battles, and the events which preceded or followed them, in which the grandees held a monopoly of the honours, seem to give most delight to CLIO; next in importance are the intrigues of statesmen; but the influence of plebeian artists and writers is ignored as steadily as if it had been exercised in a different planet. In how many of the English histories will the name of SHAKESPEARE or MILTON be found? As regards art, its neglect must be ascribed to the ignorance of the historians about that subject. In no other way can we explain the omission of any reference to the Mediæval architecture of England in LINGARD's voluminous history, although it bore a close relation to the doctrines which his work was intended to support. When the absurdity of ignoring the things which had most concern for people was exposed, MACAULAY did announce his intention to depart from the old track. He promised "to trace the progress of useful and ornamental arts," and was not to neglect the revolutions of furniture. But he was soon tempted to return, or he may have found the task was too burdensome. Not much can be gained when one discovers that what is meant by ecclesiastical architecture is an inventory that seems like an extract out of an auctioneer's catalogue, viz.:—"The fair chapels of New College and Saint George, the nave of Winchester, the choir of York, the spire of Salisbury, and the majestic towers of Lincoln." When a more ambitious effort is made by one of our historians to suggest the relation between art and a particular period, it is rarely successful. There is Mr. LECKY, for example. He attends the private views of exhibitions, and sits at Academy banquets; but in spite of so many sacrifices, his chapter on English art in the eighteenth century would not do credit to a schoolboy.

There are some things in which the French beat us, and the appreciation of art by writers is one of them. We need no stronger evidence of the fact than the four volumes on ancient history by M. LOUIS MÉNARD. They are to be classed among the low-priced books, and are closely printed without any luxury of type or paper, being intended to be obtainable by students of a humble class. But what must strike everybody at the first glance is the vast number of the illustrations, especially in the parts relating to Greece, Assyria, and Egypt. Being reproductions from expensive engravings, they have an educational value on account of their accuracy that could not be attained by ordinary woodcuts. They are not introduced merely as embellishments of the volumes, but as evidence to throw light on the character of ancient peoples. M. MÉNARD does not appear as the historian of art, nor does he, in retaliation for what was done heretofore, sacrifice politics to it. Art is with him only an instrument which can be made to give help in revealing the past when other aids are wanting, or which can be used to supplement those aids. He maintains that works of architecture, sculpture, and of the domestic arts are the mute and unimpugnable witnesses of the manners and customs of a nation. Criticism may doubt the apocryphal anecdotes which imparted so much picturesque interest to the old histories; but a compensation is found in the instruction which is received through the eyes, and which is the most attractive of all. The comparison of monuments thus leads not only to the history of art, but to the history of civilisation.

The English reader must, however, be warned that the volumes will not be considered as orthodox by those who believe in a revealed religion. Like the soul in the "Palace of Art," M. MÉNARD sits "holding no form of

creed but contemplating all." Nor will his theories satisfy many who are outside the pale of Christianity. M. MÉNARD does not even agree with the doctrine of evolution which now finds so many supporters. He holds that events are neither the effects of chance nor of a necessary evolution, but are the moral consequences of a great law of equilibrium and of expiation which is the Nemesis of history.

M. MÉNARD begins with the history of Egypt. He shows how no monument belonging to the First Dynasty is to be found, and the most ancient architectural work is, therefore, the pyramid in stages at Sakkara, which is supposed to be the tomb of a king of the Second Dynasty. According to M. DE RONGÉ, the earliest work which can be classed amongst sculpture is a relief at Ouady-Magara, representing King SNEWROI, who is represented standing over an enemy whose hair he holds, an attitude which was often repeated in the portraits of subsequent kings. M. MÉNARD quotes what is said by his countryman, MARIETTE BEY, about the Pyramids being a striking recognition of the doctrine of the immortality of the soul. They could not be easily overturned, and while they remained they were evidence of the truth of the dogmas of the priests. But M. MÉNARD is too honest a Republican to see much virtue in such proofs. If the Pyramids were smaller, he says they would be more convincing in that sense, for if a king's soul is immortal, the plebeian's soul should possess a similar quality, and there is no morality in making tombs express the inequality among men in this world. Besides, the dogma of a future life is consoling, because it inspires the hope that an unjust inequality will be redressed. M. MÉNARD does not bestow much pity upon the Egyptians, who in death as in life recognised their inferiority to their rulers. He also shows himself to be a Parisian when he tells us that the Greeks supposed the Sphinx in the desert was a representation of a woman, because "la femme est l'énigme éternelle."

M. MÉNARD considers that a study of Egyptian remains is sufficient to convince people of the unsoundness of the theory which makes art have its origin in religion. Architecture, it is said, appeared first in the temple: the manifestation of religious thought, and all other forms of art, were derived from the temple or associated with it. Now he maintains that in the earliest Egyptian paintings the art is entirely mundane and realistic, the subjects are taken from agriculture, field sports and common industries. There is no religious symbol. Sculpture had evidently an existence separate from the temples, since the statues which were most ancient—the wooden figure of the overseer RAEM KE in the Boulak Museum being one—are portraits. This will suggest the spirit in which M. MÉNARD studies art, and it will have advantage in compelling readers who believe in the established theories about the history of art to think over the grounds of their faith. In some books on architecture the Doric order is traced to the columns in the grottoes at Beni Hassan, a theory which may be credited to CHAMPOLLION. WILKINSON, who did not trust to manipulated engravings, after seeing the place did agree that the prototype of the Greek column was to be found there. M. RAMÉE suggests that the columns at Beni Hassan were probably wrought by Greek prisoners. M. MÉNARD denies any relationship between the two columns, since there is no swelling in the shaft, no echinus, no triglyphs, no metopes to be seen at Beni Hassan. If the Greek architects desired to draw inspiration from Egypt, something more eligible than the posts in the grottoes could be found. The architecture, painting, and sculpture of the Egyptians are described by M. MÉNARD, in order to suggest some of the characteristics of the people and their institutions. He maintains that Egyptian art should never be compared with Grecian art, which owes its existence to a very different sort of inspiration. According to our author, it is only in a republican society that aspiration towards an ideal, and a sense of the dignity of man, are possible. In Egypt art was used as a means to consecrate the prowess of the monarch or the acts of devotion to a divinity. The religious subjects are scenes of ritual ceremony. There was no search after ideal beauty; but grandeur was obtained in architecture by simplicity of the lines, and in sculpture and painting by simplicity of forms. The representations of domestic life which the Egyptian

\* (1) *Histoire des anciens Peuples de l'Orient*; (2) *Histoire des Israélites d'après l'Exégèse Biblique*; (3) *Histoire des Grecs*. Par Louis Ménard, Docteur ès Lettres. Avec de nombreuses illustrations d'après les monuments. Paris: Librairie Ch. Delagrave.

painters have produced for us are more valuable as historical evidence than Greek works, which are of higher merit as works of art. There is no difficulty in realising the everyday life of an Egyptian gentleman, but we know the Greeks only through literature. It is hard to say how far they went in their idealisation. When we learn that EURIPIDES was condemned because he attempted to hold the mirror up to nature by making the characters in his tragedies bear some resemblance to the people who lived at the time, it is evident that the daily round of life was not supposed to be within the province of art.

The Assyrians, who come next in M. MÉNARD's book, are described by him as a stern and bellicose race. No people could have a firmer faith in the virtue of strong battalions, or show more cruelty when they were the conquerors. An inscription records how enemies would be treated by the monarch. "I constructed a wall," says ASSOURNASIR-PAL, "before the great gates of the city. I flayed the chiefs, and covered part of the wall with their skin; some were burnt within the masonry, others were crucified or impaled. Many more were flayed in my presence, and their skins placed on the stones. The heads were heaped into the form of a crown, and their bodies into the form of garlands." Another mighty hunter of men glories in the number of hands he cut off, the eyes he plucked out, and the cities he demolished by fire. Not one of them says, remarks M. MÉNARD, that he is a ferocious beast; on the contrary, he takes himself for a great man, since all the world is in fear of him.

The art corresponds with the character of the people. The value of muscle was recognised, and the king was represented as the most muscular of all. HERCULES, assuming him to be of the physique seen in the Greek statues, might hesitate before he encountered one of those splendid fellows who have not an ounce of superfluous flesh, and one of whom can singly attack a fortress, and allow a lion to approach his chariot before he condescends to kill the beast. The attendants on royalty are also men of might, and everywhere there is recognition that the safety of the empire lay in the vigour of the inhabitants. War inspires most of the representations; and while we see very little of the lives of the ordinary population, it is almost possible to trace all the details of the military uniforms. But if their neighbours did not inspire the Assyrians with fear, they were evidently in dread of invisible beings. Magic and astrology flourished among them, and their operations in war were supposed to be for the exaltation of the gods.

M. MÉNARD in the same volume also treats of Phœnicians, Indians, Medes, Israelites, and Persians, in order to complete the history of that part of Asia which was most related to Europe.

New theories of language and mythology have increased the interest in the Asian mystery, but people to whom art is supreme will prefer to read M. MÉNARD's volumes on Greece. His method of treatment will be apparent from his first sentence, where he lays down the maxim that to comprehend the character of Greek civilisation, a knowledge of works of art is at least as important as a knowledge of works of literature.

That M. MÉNARD is an enthusiastic Hellenist will be evident from the following lines out of the poem which he prefixes to his history:—

Dieux heureux, qu'adorait la jeunesse du monde  
Que blasphème aujourd'hui la vieille humanité,  
Laissez-moi me baigner dans le source féconde  
Où la divine Hellas trouva la vérité.

Laissez-nous boire encor, nous, vos derniers fidèles,  
Dans l'urne du symbole où s'abreuvaient les forts.  
Vos temples sont détruits, mais, ô Lois éternelles,  
Dans l'Olympe idéal renaissent les Dieux morts.

But all these aspirations after a past which cannot be recalled does not interfere with the author's pursuit of truth. He begins with a description of the geography of Greece, tells us of the latest speculations about the origin of the inhabitants, analyses their religion and legends, speculates upon their manners and institutions, explains the advantages and defects of the Government, and traces the eventful history down to the establishment of the Roman empire.

It is difficult for a Parisian not to believe in the omnipotence of cities. It is the business of the country to

uphold them. As AUBER the composer said once, "La campagne c'est bon pour les petits pois." The Greeks were a people of that kind, and their art could never have so nearly approached perfection if they were afflicted with any weakness for bucolic pursuits. Dwelling in cities there might be constant danger of abuses, but there could be no tyranny resembling what was to be found in Asia. The Greek city, says M. MÉNARD, was based upon the double principle of direct legislation and gratuitous government, and a barbarian in the eyes of the inhabitants was not necessarily a vulgar or uncultured man, but one who was deprived of those advantages.

We have said that M. MÉNARD will not recognise any indebtedness to Egypt for the Doric column. He insists that Greek architecture was racy of the soil of Greece. The temples, he says, were imitations of the timber huts which are still to be seen in Lycia and other parts of Asia Minor. He will not believe in the origin with an individual of any feature, and sets aside the venerable tradition concerning the origin of the Corinthian capital. He has faith in the inspiration of crowds. Just as religious fables and epic legends come from them, in the same way architecture and decoration were their collective and anonymous work. The Corinthian capital, according to M. MÉNARD, was no more than a copy of another form of capital, when seen surrounded by leaves and flowers on the occasion of a fête. The Ionic, on the other hand, was derived from the rolls of drapery on each side of a cippus or stele. The friezes represented the skulls of the sacrificial animals which were hung outside the temple, and united by garlands of flowers. Polychromy owed its origin to a desire to give the colours as well as the forms of the festal decorations.

Sculpture in terra-cotta, according to M. MÉNARD, appeared first in Greece, and the material was used for acroteria, antefixæ, and metopes. He does not credit the legendary origin of the art with DÆDALUS. As the name signifies industrious, the mythic sculptor or wood-carver was only a sort of personification of the first schools, although some of the families of sculptors in Attica—SOCRATES being a member of one of them—claimed DÆDALUS for an ancestor. There is much muscular development of an Assyrian sort in the early sculpture of Greece; but, according to our author, it is difficult to believe in any communication with Assyria.

It was under PERICLES that "le problème social résolu par l'art." M. MÉNARD sees in him a type of the true demagogue—that is, a guide of the people, who was everywhere and in everything a true citizen; and hence, through his counsel, Athens merited to be called the Greece of Greece. But it is not generally known that the great works which were undertaken at his suggestion were intended in a great measure as a means to find employment for many people. They were utilised in preparing materials for the buildings, in erecting temples and theatres. Who can count the number who were engaged in works where so many materials were used? "All the decorative arts united with architecture," says M. MÉNARD, "to express the political and religious thoughts of the people, who were happy by labour and a recognition of what was true and just, and especially by the spectacle of so much beauty. PERICLES had found in art—which is the highest form of labour—a solution for that problem of how to deal with the misery which disturbs the equilibrium of modern Europe." It is in accordance with this view that M. MÉNARD should see in the procession around the Parthenon a representation of the people celebrating the most august of their religious festivals.

With all our admiration for Athens, it is impossible not to recognise that seeds of decay were in the city. No human institution is safe against corruption. Athens would engage in a fratricidal war, and from that time its greatness began to wane. The city was devastated by a plague; there were revolts among the inhabitants; the artificers could find no employment as the treasure was expended on the campaigns. The Sicilian defeat was only one event in a series of disasters.

But art contrived to survive. The moderns, as M. MÉNARD remarks, imagine that they display purity of taste by restricting their admiration to the Parthenon sculptures. But the Greeks were more catholic. They

considered no offence was committed against the *Zeus* of Olympia, or the *Athené* of the Parthenon, when one praised the *Juno* of POLYCLETUS and the *Venus* of Cnidos. It was subsequent to the age of PERICLES that types of figures were recognised as a sort of law, and sculptors felt bound to pay tribute to the past by reproducing the form of their predecessors. Hence, says M. MÉNARD, every Greek statue is a translation by an individual of a thought that was collective, and the divine types created by the sculptors are the roots of that language which speaks to us through our eyes.

In comparing Greek and modern sculpture M. MÉNARD considers that the defects of the latter arise in a great measure from trying to be over expressive. But it is in the application of sculpture to architecture that he sees the most marked difference. By avoiding the use of colour, by placing statues along a wall or in niches of the same colour, and by fixing figures at heights where they cannot be discovered without the aid of a telescope, it becomes plain that sculpture is no longer a necessity to intellectual life as it was among the ancients.

It might be supposed that Greek art was not likely to survive loss of liberty. One class of works became impossible, or fell out of fashion. Gods and goddesses were henceforth more akin to mortals. The portrait statues and busts, on the other hand, appear to be efforts to confer a more than manlike character on the subjects. Then the Greek schools of Asia Minor produced a glorious harvest. One of the renowned works is the *Venus of Melos*. M. MÉNARD gives a sketch of the statue as it appeared when brought to Paris before the inscription was removed, which recorded that it was the work of a sculptor of Antioch. The authorities of the Louvre were afraid that as a name counts for much, the Parisians would think little of a statue which could not be ascribed to some great Athenian. The *Laocoon* is by many supposed to come from another of the distant schools, that is, Rhodes. When the Romans in turn became masters of the world, they were able to have statues produced by Greek sculptors, but the position of the artist was no longer the same,

The bigots of the iron time  
Had called his harmless art a crime.

At Rome, says M. MÉNARD, SENECA asked if painting and sculpture could be classed with the liberal arts. PLINY and CICERO were no less disdainful. Yet, in spite of so unfavourable an atmosphere, sculpture died slowly.

We have said enough to suggest how unlike most histories are the works of M. MÉNARD. It is courageous on his part to be so frank in recognising the power of art and in insisting on its appreciation as one of the duties of a free State. It would be well if ancient history could in this country be taught from such valuable books, but it would be necessary to eliminate parts which do not correspond with doctrines that are accepted in a great part of the globe. Admiration of pagan art does not make it necessary that the world should again be suckled in a creed forlorn; or, to transpose the words of M. MÉNARD, "Il n'est pas nécessaire de proscrire le juste pour exalter le beau."

#### THE GLOUCESTER BATHS AGAIN.

AT the meeting of the Gloucester Town Council, on June 26, a report from the Baths Committee was read, in which the acceptance of the tender of Messrs. W. Storrs, Sons & Co., Limited, of Stalybridge, was recommended, it being understood that the contract price, including finishing and fitting up of the baths, was not to exceed 7,500*l*.

Mr. Platt, in moving the adoption of the report, explained how the increase, beyond the stipulated sum of 6,000*l*., had arisen owing to the alterations proposed by the committee. The lowest of the first general estimates was 8,499*l*., and additions brought it up to 9,190*l*. He would strongly recommend the Council to go in for the whole thing, and said he would rather spend 9,000*l*. than the 7,500*l*. on the baths. It was no use blinking the fact that the report of the Baths Committee was a compromise. They had cut down the plans to a plain bare building, which would come to something like 7,500*l*. He hoped the Council would consider the matter fully, and not have a block of buildings of which they would be ashamed.

Mr. Peake proposed, as an amendment, that the report should not be adopted, nor any tender accepted at present. Mr. Trew, the architect, wrote last February to say that he

would abide by the conditions, one of which was that the total cost was not to exceed 6,000*l*. Now they were asked to approve of the erection of a mutilated set of plans at a cost exceeding the 6,000*l*. by one-fourth. He could not help thinking that the committee certainly misunderstood their instructions, and that it would have been greater wisdom and judgment if, when they found this amount was so very much exceeded, they had taken the Council into their confidence.

Mr. Mousell inquired whether Messrs. Giles & Gough's plans were not considered the best. He understood that their plans were recommended by the expert as being the best, but were refused by him on the ground of cost. He also understood that Messrs. Giles & Gough, who had designed the Second County Asylum, were prepared to find a man to build baths on their plans at their estimate of 6,000*l*. Might he ask why these plans were not adopted?

Mr. Powell said that if Mr. Trew's plans had been carried out as they were they would have been good enough, and could have been built for 6,000*l*. But fortunately, or unfortunately, for the citizens, they got a lot of practical men on the committee. First they got an engineer, who said the boilers must be larger, and then a builder, who said they must have thicker walls, and thus the buildings were enlarged and the cost increased, so that they could not get the plans carried out under 9,000*l*.

Alderman King said Mr. Powell had been kind enough to refer to practical men, but he thought Mr. Powell would understand that he was deficient in that respect, for when the plans were on view that gentleman refused the elevation of one set of drawings, and then went and chose the perspective. When this was pointed out to him Mr. Powell remarked, "I know as much about drawings as a penny-piece."

Mr. Powell admitted that he said so.

Alderman King said he should like to see baths erected in a more efficient manner than was now proposed. He had carefully gone into the details. The Council had given the committee power to go to a limit of 6,000*l*. for baths, and their total cost, including the price of the site (1,550*l*.) and the architect's commission (350*l*.), was to be 7,900*l*. Taking the lowest original tender, which was 8,499*l*., and adding 663*l*. to it for the alternatives, it gave 9,162*l*. Then must be added 1,550*l*. for cost of site; 686*l*. for architect's and surveyor's commission, 400*l*. for works necessary, 120*l*. for clerk of the works, 500*l*. for contingencies at 5 per cent., and 100*l*. for incidentals. These items gave a total of 12,518*l*., and deducting from this the 7,900*l*. for which the committee had authority, the excess appeared at 4,618*l*. Under these circumstances, he did not think the committee should have recommended the adoption of any tender. He still hoped that Gloucester would have baths, and that the present committee, or some new committee, would place the matter in an acceptable form.

The Mayor said the last time he attended the committee he understood that the plans could be carried out for 6,000*l*.

Mr. Seekings said that in Mr. Trew's plans as presented the baths were in such a position that one man could look after both of them. They wanted to provide baths for all classes, and that was the reason why they had not adopted any one plan in its entirety. He was sorry to be in a position to advocate an expenditure which he had hoped would not be exceeded. The committee were anxious to get a good set of plans, and he believed a smaller building would bring failure. He named several towns where they were enlarging their baths. If the Council decided that the limit of 6,000*l*. was to be kept within, they decided that the dimensions of the buildings were to be greatly reduced, and he hoped they would hesitate before they adopted so fatal a policy.

Mr. Arkell suggested that the whole question be referred to a committee of the entire Council. Then Mr. Mousell's suggestion as to another plan and any other plan could be considered.

Alderman Mott said he was of opinion that the Council began in error with regard to the baths question. Before fixing the amount of cost they ought to have first decided what sort of baths they wanted, and then have asked for plans. He thought the question of cost had nothing to do with it. The amount of 6,000*l*. was simply founded upon the statement of some one that baths had been built for that amount in the country. He was not prepared to vote for the reduced plan. Certain points had been clearly brought out which showed that the Council could not get what they wanted for 6,000*l*. If the Baths Committee would be good enough to explain in detail their reasons for altering Mr. Trew's original plan and for submitting an altered plan and estimate of about 9,000*l*., and what would be lost in the cutting down of the plans, then perhaps the Council would be in a better position to come to a decision on the matter.

Mr. Peake said he should have great pleasure in accepting Mr. Arkell's suggestion. His amendment would now be, "That the report of the Baths Committee be not adopted, and that no tender be at present accepted, but the whole question be referred to a committee of the whole Council."

The Mayor said he was a member of the committee, and the last time he attended Mr. Trew was present with his amended plans, and he put the question distinctly to Mr. Trew, "Can these plans be carried out for 6,000%?" And Mr. Trew distinctly said they could be carried out for that amount. Mr. Platt said he did not agree with that, and that they would cost 500% or 600% more. Mr. King said, "No, 300%." It was Mr. Trew who had made the mistake (a Voice: "No"). He (the Mayor) said it was Mr. Trew, and not the committee. Any practical man who looked at the plans must have seen that they would cost at least 8,000% to carry out. That was why he proposed in Council that sanction should be obtained to borrow 8,500%. Mr. Trew ought to have told them that the cost would exceed 6,000%. As a member of the committee he declined to take any blame whatever.

Mr. Estcourt thought that when these modifications and suggestions were made in his plans, Mr. Trew ought to have stated to the committee that, if they were going to make all these alterations, they would much increase the expense beyond the 6,000%.

Mr. Platt, in reply, said Mr. Trew was not responsible for the additions. It must be borne in mind that the cost could not be told until the quantities were taken out. Mr. Mousell had brought up about Messrs. Giles & Gough's plans. The committee did not go into that, as the expert said their plans were too large, and would cost more than the sum prescribed. He was quite agreeable to the question being referred to a committee of the whole Council. The committee had taken too much on themselves, and ought to have left it more to Mr. Trew and the surveyor. The reason the committee did not place the original tenders before the Council was that they thought it would save time if they obtained revised tenders before doing this. He was willing to withdraw his resolution in favour of the amendment.

Mr. Peake's amendment as altered then became the substantive motion, and was carried unanimously.

The Mayor said he would take an early opportunity of calling the committee of the whole Council together.

#### THE IMPERIAL INSTITUTE.

ON Monday a meeting of the organising committee of the Imperial Institute was held at Marlborough House, being the first meeting since the grant of the charter of incorporation to the Imperial Institute. By the terms of the charter the organising committee is appointed the temporary governing body of the Institute for a period not exceeding three years from the date of the charter (May 12, 1888).

The previous action of the organising committee and of the various sub-committees having been approved, the Earl of Rosebery, Lord Herschell, and Sir John Rose were appointed trustees for the endowment fund, the minimum value of which is fixed by the charter at 140,000%.

His Royal Highness the President then nominated Lord Herschell and Sir John Rose respectively as chairman and vice-chairman of the organising committee, and various special committees were appointed.

The Governor of the Bank of England having, with the approval of His Royal Highness the President, nominated Messrs. Lovelock, H. W. S. Whiffin, and Dickinson, chartered accountants, of Coleman Street, City, auditors of the Imperial Institute, they were formally appointed to the office.

The organising secretary and, in his absence, the assistant secretary were designated the proper officers to sign or counter-sign documents on behalf of the corporation.

The organising secretary submitted a statement of progress since the date of the last meeting, by which it appeared that the actual funds now available, exclusive of subscriptions from the Indian Empire and temporarily invested there, amounted to 310,000%. The steps taken in furtherance of the establishment of the department of commercial intelligence and the outlines of a proposed scheme for a school of modern Oriental languages were described and approved.

The minutes of the meetings of the various sub-committees held since January 27 having been read and action thereon authorised, the lease for the conveyance of land from the Royal Commissioners for the Exhibition of 1851 and other documents in connection therewith were duly approved and executed.

The foundations for the main buildings were reported as having been completed in May last at a cost of 6,000%.

On the recommendation of the building sub-committee, the tender of Messrs. J. Mowlem & Co. for the making of the new road, to be known as the "Imperial Institute Road," was accepted at the sum of 5,825%.

The same firm's tender for the main buildings, exclusive of the central and eastern and western towers, was accepted from a list of fifteen competing contractors, the amount of the tender being 142,800%.

The organising committee, on the motion of Lord Herschell,

unanimously passed a vote of thanks to His Royal Highness the President for the zeal and energy displayed by him in the work of the Institute.

#### THE APPLIED ART SECTION OF THE SOCIETY OF ARTS.

THE report of the Society of Arts, which was read at the general meeting, has the following reference to the work of the section of applied art:—

The subjects dealt with during the present session in the section of applied art range over a varied field, and at the several meetings, bronze monuments, Persian textiles, book-binding, architecture, and colour in decoration were treated of, and the relations of craftsman and manufacturer were discussed. At the first meeting on January 31, an instructive paper was read by Mr. J. Starkie Gardner on the "Monumental Uses of Bronze," which may be considered as a companion to his paper last session on "Wrought Ironwork." The author, by means of the lantern, brought before his audience representations of nearly all the historical bronze monuments in England, as well as some of the chief specimens abroad. At the second meeting a paper was read by Mr. H. B. Wheatley, entitled "Principles of Design as applied to Bookbinding." In connection with this meeting, an exhibition of examples of historical and modern bookbindings was arranged in the library, which remained open for ten days, and was visited by a considerable number of connoisseurs and practical bookbinders. On March 20 Mr. William Simpson asked the question, "What Style of Architecture should we follow?" in a paper which originated a lively discussion among the architects present at the meeting. On April 24 Mr. Lewis F. Day urged the inutility of the middleman in art, in an interesting paper on "Craftsman and Manufacturer." Mr. J. D. Crace read a valuable paper on "The Decorative Use of Colour," on May 6, in which he pointed out the need of considering colour as a means of laying stress on the main constructive features of a building. The work of the section was brought to a close on May 29 by a paper on "Persian Fabrics," by Mr. Cecil Smith, which was fully illustrated by a series of fine specimens of various textiles, brought from Persia by Mr. Smith.

#### TESSERÆ.

##### Religion and Art.

W. DYCE, R.A.

OF the only three great systems of art which have arisen, two undoubtedly derived their character from religion. Perhaps the third, in some respects, did so too; but this is less certain. These three systems are the Egyptian, the Pagan Greek, and the Christian, the first more or less including in it the arts of Oriental antiquity, the second comprehending the whole of ancient Classical art, and the third the art of more modern times, so far as it has been exclusively Christian. The Egyptian art was essentially symbolical in its purpose. Although it employed for that purpose representations of a great variety of natural objects, yet exactness and truth of imitation were only carried far enough to indicate the reality, and that with a view to express ideas of which the objects were the representatives. The figures in Egyptian paintings, as an acute writer, M. Raoul-Rochette, has observed, were ideographic signs rather than figures to be considered as representing the objects of which they were the resemblances. And hence Egyptian art as a whole is excluded from the domain of the fine arts properly so-called. The Greek system, on the other hand, was strictly imitative, and in such sort that it carried the exact representation of individual objects to the highest degree of perfection of which they were susceptible; and thus what we term the ideal in Greek art was nothing more than the reality itself under its most embellished form. The aim of this kind of art being to render, with as near an approach to perfection as was possible, the forms of animate nature, it is obvious that physical beauty must have been, as indeed it was, an element so essential that every particular was subordinate to it, whether in the choice of subjects or in the manner of their execution. All was intended to elevate and deify nature; everything, therefore, that could suggest thoughts of imperfection, meanness, or feebleness, unless in the way of caricature, was carefully excluded; while the positive or negative qualities that tend to inspire us with ideas of resistless physical power, unchanging perfection, beauty, or dignity were as carefully had regard to. And although the art of the Greeks was not altogether devoid of moral expression, yet in general they seem to have admitted the operation and effects of the passions as an element in art only so far as was consistent and compatible with the physical perfection which, under the guidance of their religious system, the arts of the Greeks were in the main intended to develop. The third great system of art, namely, the Christian, so far agrees with the Classical that it

takes nature for its guide and its model; but it exercises itself on types altogether different, and has for its drift to interest the moral sentiments rather than to charm or flatter the senses. As in the Greek art certain types of human perfection were invented and worshipped, so also in Christian art there arose an imitative system in which were embodied under peculiar types the faith, sentiments, and aspirations of our divine religion; but there was this grand difference between the two, that whereas in the one the types were all more or less of a kind to exalt and glorify human nature, in the other they were based more or less on the griefs, the feebleness, the imperfections of humanity. In few words, Christianity effected in the domain of art a revolution precisely analogous to that which it brought about in the moral and social world; it introduced a new standard of perfection in art, made that standard spiritual rather than physical, and taught artists to aspire after a kind of excellence which it is no figure of speech to say would have been looked upon by the Greeks as foolishness. What, for example, could the Athenians of the time of Phidias have thought of the emaciated, haggard, mean, and sorrowful pictures of saints drawn by the best artists of the Christian school? Must they not have felt that their idol, human nature, was outraged and brought into contempt by such representations? Must they not have hated them as mortifying to their pride, or despised them as unworthy of their regard? Yet such is the positive, marked, and antagonistic difference between Classical and Christian art. The one has its Jove, its Hercules, its Mars, its Venus, its Graces—the representatives of majesty, physical power, warlike courage, love, and kindness; the other its Christ, its apostles and doctors, its army of martyrs, its virgin mother, its graces, its virtues. But though its Christ be majestic, he is in the form of a serpent; though the power of its apostles was resistless, yet “the weapons of their warfare were not carnal;” though its army of martyrs be courageous, their courage lay in endurance; though its virgin mother be beautiful and pure, yet “a sword pierced through her heart;” though some of its graces and virtues were esteemed among the Greeks, yet, if we take them as a company, they are in reality the complex type of self-abnegation. In brief, through the whole system of Christian art there is somewhat of a forbidding, mortified, and humbled exterior, derived from the character of the religion in which it originates, by which it is distinguished from the attractive and (not to use the word in its bad sense) the sensual qualities of the Classical school.

#### The Frieze of the Parthenon.

T. DAVIDSON.

Pericles's ulterior purpose in the whole matter (of the national festival) was to bring about a confederation of all the Greek states under the hegemony of Athens; and second, that inasmuch as most of the Ionic states were already under her leadership, and the Aiolic states, at least, not unfavourable to her, this purpose mainly resolved itself into a scheme for inducing the Doric states of Peloponnesus to enter the confederation. We should, therefore, naturally expect that one of the processions would be mainly Ionic, the other mainly Doric, and that the two would be clearly distinguished, the one as Ionic or Athenian, the other as Doric or Spartan. Instead of Ionic and Doric, indeed, we may write Athenian and Spartan, for Pericles meant nothing less than to see Sparta placed under the hegemony of Athens. Let us next, as a second preliminary to our examination of the frieze, try to make clear to ourselves the problems which the artist, desiring to represent the subject supposed, would have to solve. First, he would have to represent two processions, and show that their purpose was a common sacrifice; second, he would have to distinguish these processions as respectively Doric and Ionic; third, he would have to show that the sacrifice had reference to a multiplicity of gods; fourth, he would have to show that the aim of the sacrifice was to bring about reconciliation and union where there had previously been alienation and division; fifth, he would have to show that the effect of the union was the acknowledgment of the headship of Athens. Now, a very cursory glance at the frieze will show us that the artist of it solved all these problems satisfactorily. First, he has given us two processions, clearly marked as distinct by separation and difference of direction; and, by introducing cattle and other objects of sacrifice, he has shown us their purpose. Second, he has distinguished the two processions as Doric and Ionic, by making the one approach the gods specially worshipped by the Dorians, the other the gods specially worshipped by the Ionians. Since the two races differed but slightly in appearance and attire, it is difficult to see how they could have been otherwise distinguished than by their gods, who, as we shall see, had to be introduced for another reason as well. To demonstrate that the gods are distinguished as Doric and Ionic would require a somewhat lengthy discussion. At present the fact must be provisionally accepted. Third, the artist has shown that the sacrifice has reference to a multiplicity of gods, by introducing these gods themselves, and we may safely assert that he could not have accomplished his purpose otherwise. Fourth, he has shown that the

object of the sacrifice is to bring about reconciliation and union where there was previously alienation and division, by making the favouring gods of the one people turn their backs upon those of the other, while the two processions approach each other and also a group standing between the averted gods and preparing for a ceremony, which must make these turn toward each other and unite in a common acceptance of offerings. How skilfully this middle group is managed, so as to express the act of reconciliation, will be shown hereafter. Fifth, the artist has shown the effect of the union will be the acknowledged headship of Athens, by placing her chief divinity in a place of honour equal to that of Zeus.

#### Da Vinci's "Mona Lisa."

W. H. PATER.

*La Gioconda* is in the truest sense Leonardo's masterpiece. In suggestiveness only the *Melancholia* of Dürer is comparable with it, and no crude symbolism disturbs the effect of its subdued and graceful mystery. We all know the face and hands of the figure set in its marble chair, in that cirque of fantastic rocks as in some faint light under sea. The presence that thus so strangely rose beside the waters is expressive of what in the ways of a thousand years man had come to desire. Hers is the head upon which all the ends of the world have come, and the eyes are a little weary. It is a beauty wrought out from within upon the flesh—the deposit, little cell by cell, of strange thoughts and fantastic reveries and exquisite passions. Set it for a moment by one of those volute Greek goddesses or beautiful women of antiquity, and how would they be troubled by this beauty into which the soul with all her maladies has passed! All the thoughts and experiences of the world have etched and moulded there—in that which they have of power to refine and make expressive the outward form—the animalism of Greece, the lust of Rome, the reverie of the Middle Age, with its spiritual ambition and imaginative loves, the return of the Pagan world, the sins of the Borgias. She is older than the rocks among which she sits; like the vampire, she has been dead many times and learned the secrets of the grave; and has been a diver in deep seas, and keeps their fallen day about her; and trafficked for strange webs with Eastern merchants; and, as Leda, was mother of Helen of Troy, and, as St. Ann, the mother of Mary; and all this has been to her but as the sounds of lyres and flutes, and lives only in the delicacy with which it has moulded the changing lineaments and tinged the eyelids and the hands.

#### Raphael and Da Vinci.

G. BUTLER.

What would have been the effect on Raphael's mind and style of painting had he remained a longer time under the influence of Leonardo is not an uninteresting question. Nay, we may carry it back to his early training and ask—"What would Raphael have been had he been brought up in the school of L. da Vinci instead of that of Pietro Perugino?" Let us transport ourselves to the great room at the Louvre, where we have specimens of Raphael's early Florentine or Peruginian manner; of his later Florentine, and of his Roman manner; and where we have also two noble specimens of Leonardo's easel pictures. Now, if we take the quality of expression—meaning thereby the thought and sentiment conveyed by the human countenance, and, in a less degree, by the attitude—Raphael's pictures stand the comparison with Leonardo's very differently. The earlier ones—the *St. George* and the picture called *La Belle Jardinière*—are thrown somewhat in the shade; but there is a chivalrous determination in the attitude of the warrior saint that shows thought and purpose in the artist, and the exquisite purity of the Virgin's expression, the charm of her oval face and downcast eyes are things *sui generis*—very delightful to the feelings if not suggestive of deep thought. But the great *Holy Family* and the *St. Michael* are positively killed by Leonardo's proximity. They may have possessed a more spiritual character when Francis I. first received them; but, as they are now seen, they wax pale—as regards the quality of expression—before the *Santa Anna* and the portrait of *Mona Lisa*. The comparison of Leonardo's (or his pupil's) *La Vierge aux Rochers*, with Raphael's *St. Marguerite*, in the long gallery, is equally unfavourable to Raphael's pretensions to the character of a thoughtful painter. It may, of course, be said that Raphael's fame does not rest on his oil-pictures but on his frescoes, and his cartoons for the tapestries. Neither does Leonardo's rest on his easel pictures, but on his cartoon of the *Battle of Anghiari* and his *Last Supper*. Putting these facts together and speculating thereon, it does appear more than probable that Raphael, had he studied under L. da Vinci instead of Pietro Perugino, would have learned to portray qualities of mind which only now and then find in him a ready and congenial exponent. And he would, doubtless, have acquired a greater insight into the structure of the human frame, and more unerring accuracy in drawing the extremities. It will, perhaps, strike the reader

that the comparison of Leonardo's serious pictures with Raphael's later works, in which he did not aim at representing intensity of thought and sentiment, is unfair. Doubtless there is more similarity between Raphael's *Sposalizio* and his *Madonna del Granduca*, and Leonardo's *Vierge aux Rochers* and *Santa Anna*, than between any of Raphael's Louvre pictures and Leonardo's. It may be said, further, that where there is no identity of aim between two painters there can be no comparison between their works. Granted. But let us compare their respective aims. If we find one painter aiming at the representation of deep thought and sentiment, and the other at that of a greater variety of emotion; the one choosing types of countenance and attitudes which harmonise with a profound, tranquil, meditative spirit, and the other delighting in the various expressions which mark the differences of age and sex, and the easy and delicate play of graceful lines which diffuse joyous cheerfulness over the picture, we are surely at liberty to say which we prefer, and which aim we think the nobler. Moreover, when the latter painter has changed his aim, when we find that, at an earlier period, he placed before his mind a different object as attainable by his art, we may surely compare the purpose of his youth with that of his later years; and if the latter appear to us less noble, we may express a feeling of regret that he had not that inducement to persevere in his early motives which the example of Leonardo would have given him.

#### The Idea in Art.

J. S. BLACKIE.

The value of the Platonic idea may be shown by an illustration from the region of the beautiful. The marble figure, which some stone-working poet has baptized a Corinna or a Sappho, and whose features, expression, and attitude combine all that is most dignified in a queen, all that is most simple in a shepherdess, all that is most inspired in a poetic thinker, and all that is most attractive in a Venus—this figure, for the possession of which to adorn their museums the heads of great monarchies will contend with rival diplomacy and emulous gold, when dashed to pieces by a sudden precipitation, is only so much lime which the farmer can fling upon his land like straw or dung or any other refuse. Its value is gone as soon as it has lost its form; the material is common and worthless. Whence, then, is this form, this *eidos* (*species*), the superaddition of which imparts so much value to an otherwise trivial material? Whence did it come, and what is it? It is plainly neither more nor less than an image impressed by the plastic power of mind on a material utterly destitute of formative force; and the value of the work consists altogether in the amount of this force, or organising intellectual energy, which has been made to act upon it from without. But this formative force is a thing altogether bloodless and untangible. Shatter the substance of the finest statue in the world to pieces, and the amount of calcine substance or earthy matter of lime remains the same as before the disintegration. It follows, manifestly, that the only real element in the admired object is that which according to common phraseology has no reality in it, viz., the idea in the mind of the artist which has been transferred to stone. This idea is, in fact, the alone thing which truly exists so far as the work of art is concerned. It is the only thing also that possesses permanency; for whereas the marble may be broken at any moment, the idea may at any time be recovered from the intellect of the artist where it was originally generated, and where it permanently resides. That the ideas which belong to genius or original creative power are innate, in the highest Platonic sense of the word, most people will be willing to concede. For, if not, why cannot every eye see in a daisy as much as a Burns or a Wordsworth saw? Why is not the physiognomy of every dog as eloquent and as pregnant with profound expression to me and to you as it was to Landseer? A common observer "wants the eye" to see in common objects what the great artist sees—that is to say, he wants an internal plastic and organising force; for it is by this mental force only, and not by mere pupils, corneas, retinas, and other apparatus of mere sensuous vision, that the man of genius obtains his superior insight.

#### Italian Influence on French Architecture.

J. GWILT.

The earliest architect in France who may be said to have had a perception of Italian architecture was Jean Bullant, between 1543 and 1573. From a portico in the castle of St. Ecouen, he appears to have preceded the age in which he lived to such a degree that he must be considered the harbinger of good taste in France. The wars in Italy under Charles VIII., Louis XII., and Francis I., had made the French intimately acquainted with the works of Italy, and the taste of the last-named monarch particularly induced him to bring from that country some of their most celebrated artists, so that there was almost a colony of them in France. Amongst these was Vignola, who was many years resident in the country; and this may with some probability account for the great esteem in

which that great master's profiles have always been held in France, and, indeed, I may say in which they are still held, though in other respects French is rather founded on the Venetian school. Another architect of note, Sebastian Serlio, was engaged in the country by Francis, and died there. Buildings are to be judged of relatively as well as abstractedly; hence the opportunities of every class which the period afforded must be taken into consideration before the powers and merits of an architect can be properly appreciated. In this respect Lescot's works at the Louvre are entitled to great praise. He was the contemporary of Jean Gougon, the architect of the well known and admired Fountain of the Innocents, at Paris, which lost much of its beauty when, many years ago, it was taken down and its site changed. From the works of Bullant, Lescot, and Gougon, the progress of pure architecture, one might have supposed, would have been without check till it reached that point to which it had been carried in Italy. Such, however, was far from being the case. Mary de Medicis, who was a native of Florence, but afterwards a resident in France, anxious when she was about to build the Luxembourg Palace to have it designed in a manner which would remind her of her native city, made her architect, De Brosse, adopt a style, as nearly as circumstances would allow, resembling the palaces of Tuscany. The rustic work of the Pitti Palace seems to have been uppermost in the mind of the architect, but his version of it is a failure. In Florence the palaces are on so gigantic a scale that they can bear out the rustic and embossed work employed upon them; but when reduced in size, a building in which they are used allows but sparing use of these practices. This palace became a model for the fashion of the day, and produced an intermediate style which lasted many years in France, and arrested the advances to perfection whereof the above works of Bullant and others gave promise. De Brosse was, however, an able artist, and well knew how to group his masses so as to produce great effect. His last work, the aqueduct of Arcueil, was finished in 1624, and it is supposed he did not long survive its completion.

#### Thinking in Stone.

A. WILSON.

There was a period of the Middle Ages when men thought in stone. Turning with dissatisfaction from the Latin hymns of Abælard, the rude grotesque miracle-plays, and the chiefly barren disputes of the schoolmen, to the cathedrals of Florence, Pisa and Lucca, of Nuremberg, and other towns in Central Germany and Flanders, the abbeys of England and Scotland, the Gothic castles, and even many rude robber strongholds, it is not difficult to see that the highest thought and feeling of the time found in those marvellous piles—those springing arches, calm falls of light, depths of shade, and doors whose beauty well deserved to last for aye—the most fitting representatives and vindications of the higher effort of man, of man making the earth more beautiful as it rolls among the stars, working according to the will of the Eternal Father, who looked down from above, consecrated to the work in the solemn place while yet a child; and even the memory of the proudest and most victorious perpetuated only by a recumbent statue with humbly clasped hands in acknowledgment of shortcoming, but undying aspiration. Each time has new wants, and the tendency has been toward more articulate forms of expression. The power of thinking in stone was lost, as thought found easier and distincter modes, and only imitations of what had been thought in that way were produced.

#### German Stellar Vaulting.

R. WILLIS.

A favourite vault in the After Gothic of Germany is, on the plan, an assemblage of lozenges formed into stars, which radiate both from the vaulting shafts and from the centre of the vaulting compartment; but in its actual appearance is an elegant and peculiar kind of fan vaulting. Vaults on this principle, and with a much greater repetition of parts, are commonly to be met with in the German churches. I suspect most of them are of wood and plaster, and in many of them the ribs are only surface ribs laid on to a waggon vault with Welsh vaulting cells, exhibiting examples of very simple vaults converted by surface ribs into very intricate ones. I would call this class of decorative vaults "stellar vaults," from the regular stellate form they assume on the plan. The principal distinction between these and our own fan vaulting is the substitution of lozenge-headed compartments in the fans for the English horizontal transom rib. We have also lozenge-headed compartments in our Early vaulting, but they are never so symmetrically arranged in stars throughout. Besides these stellar vaults, other intricate ones may be found at Munich Cathedral, the Frauenkirch, Frankfort, &c., of a kind totally differing from elegant English specimens, and in which the architect, forsaking grace and beauty, has degenerated into that fancy for producing difficult specimens of stone-cutting at the expense of architectural consistency, which is so much the character of the German After Gothic. In these the vaulting ribs are not placed symmetrically, and the vaulting cells are often oblique.

## NOTES AND COMMENTS.

THE Fine Arts Jury of the Paris Exhibition of next year have considered the question of the form which the diploma is to assume. Will it be one of the photographic reproductions which are now so much admired in Paris, or an engraving in the old-fashioned lines? Engraving has found favour with the jury, and the Minister will be advised of the conclusion. The certificate for the Exhibition of 1878 was designed by the late PAUL BAUDRY, and a photographic plate from it was issued. The painter was satisfied with it, and more than satisfied with one which appeared in this journal. But it is said by the jury that the certificate has not worn well. Copies which are in the possession of English exhibitors do not bear out that view. However, the test applied is the desire of the collectors to get hold of a copy. If the certificates are of any value to the exhibitors to whom they were awarded, it is strange that any should be allowed to get into the market. They ought to be prized and become heirlooms. It is said that the certificate of 1855 is a coveted addition to a portfolio, and it was an engraving by CALAMETTA from a design by INGRES. In England a good deal is also thought of engraved certificates. Sir FREDERIC LEIGHTON has a copy of STEVENS's for the Exhibition of 1851 hanging in his house; and DYCE's for the Exhibition of 1862 is also deserving of admiration.

MR. E. R. ROBSON is likely to have a very complicated lawsuit on his hands unless some arrangement can be made. A special committee of the London School Board, the chairman being one of the members, have proposed the following resolution for adoption: "That, in the opinion of the Board, the late architect of the Board is responsible for the absence of proper foundations at the Broad Street School, Ratcliff, Tower Hamlets, and that he be called upon to make good the loss arising therefrom." The case has for some time occupied the attention of a few of the members. In last April attention was called to cracks in the walls, and a test-hole was dug. The present architect to the Board reported that the foundations under the north-west wall, "instead of resting on hard ground, as they should do, stand immediately on a soft bottom of foundry ashes." Four additional holes were afterwards opened, and the measuring surveyor reported that, whereas the contract depth was said to be 10 feet, the depths executed were 7 feet 4 inches, 7 feet 3 inches, 9 feet 9 inches, while the depths paid for were 12 feet 8 inches in two places, 11 feet 9 inches, and 15 feet 6 inches. The concrete was described as being 6 inches or 7 inches thick, and lying under it "a mass of rubbish having no binding qualities." But whether the rubbish was put in with the foundations the surveyor could not say; the footings, he said, "seem to be built principally of old bricks." Mr. T. M. RICKMAN was called on to verify the measurements. In the course of his report he speaks of the concrete in one place as "composed of large lumps of slag and lime," in another place it has "unbroken brickbats and large lumps of slag," and "the mortar of footings is like black mud." Mr. RICKMAN says the site appears to have been a foundry, and the materials used for concrete seem mostly to be foundry refuse.

COPIES of the architect's and surveyor's reports were sent to Mr. ROBSON on June 13, and he was informed that the special committee proposed to recommend the Board to call upon him "to make good the loss occasioned to the Board" owing to their payment on Mr. ROBSON's certificate for work which has not been really done. Mr. ROBSON in the course of his reply said:—"The committee appear to have it in their minds that it was the duty of the architect to see everything personally, and that he should be held personally liable for the mistakes or misconduct of the officials acting under him, as well as of the builder. From the nature of my appointment, and the enormous pressure of work devolving upon me, the first was always known to be impossible in my case; and the second is, I venture to think, an unreasonable view. In addition to the clerk of works, an inspector of works had been appointed by the Board with the distinct object of relieving me from the bulk of the inspection, and he devoted his entire time to the work. My own inspections were directed more

particularly to points of light, ventilation, and other matters affecting the daily life of the school, of which the inspector could not be expected to judge. My certificate, when given, was based on the results arrived at by the surveyor. In every case it was given in perfect good faith, and to the best of my information and knowledge. I believe that any exceptions which may be found will only prove the rule that the great mass of schools are well built. And they have been produced at a cost per cubic foot little over that of cottage building. The Board Schools of London are to-day admittedly the best elementary schools in the world. No one can more deeply regret than I do the occurrence of anything tending, even in a comparatively small degree, to the discredit of a great work of which I have some right to feel proud. The proposal of the committee would be, so far as I know, entirely without precedent, and would affect not only me, but the whole profession to which I have the honour to belong." The case will be most difficult to decide, and the Board would do well to consider whether it is prudent to expend more money in providing a precedent.

SINCE SHAKESPEARE has a statue in Paris, although in an unsuitable place, the question, "Why is there not a statue of HONORÉ DE BALZAC?" must be more difficult to answer. The author, who is considered by many to hold the first place among French novelists, and who undoubtedly had most claims to be taken as the successor of MOLIERE, certainly deserves to have some recognition of admiration in marble or bronze. The literary societies have again taken up the subject, and as the first step in the revival is the giving of subscriptions instead of discussing the form of the statue and the sculptor who was to be commissioned, which was formerly the beginning of such business, the requisite money is not likely to be long absent. It is not expected that England will contribute much, for in no part of the world are his books less known than in England. Some exception may be made in favour of "Père Goriot" and "Eugène Grandet," but they are only a part of the great series of the *Comédie humaine*.

BRUSSELS has now an archæological society. It has existed for a year, but has not come into prominence until recently, when the members met in the great hall of the Academies. The acceptance by M. ALPHONSE WAUTERS of the office of President will do much towards raising the character of the society. In his address, the President discussed the question whether there was a poet named HOMER. He decided in the affirmative, and based his conclusion on the character of the poems and the unanimous belief of the ancients. M. LOË read a paper on the tumuli which are found near Boitsfort. It is hoped that the society may be enabled to undertake an exploration of them. M. DESTREE described a psalter in the Bibliothèque Royale of Brussels, which probably belonged to ROBERT BETHUNE; and M. MAHY read a paper on ERASMUS and his "Praise of Folly." There is much in Belgium that can interest the archæologist, and if rightly managed the Brussels society can do most useful work.

THERE is so much confidence in the strength of Paris houses no one need wonder when one is left without shoring, although the adjoining house may be entirely removed. Besides, shoring is always expensive in Paris owing to the quantity of timber which must be used. The builders seem to have overmuch faith in the strength of all materials except wood. A remarkable accident has just happened in Paris, which might have been avoided by the temporary use of a few balks of timber. A corner house was taken down in the Rue du Château-d'Eau, in one of the most crowded parts, but no provision was made to support its neighbour during the rebuilding. Soon afterwards a noise of cracking was heard, but the inmates of the unsupported house were not frightened. However, during the night one-half of the house fell over, burying several people in the ruins. It was discovered that the outer wall was of worse construction than is common in Paris, and the floors were not well tailed into it. Although much suffering was caused, as yet there are no deaths. The Municipal Council voted 1,000 francs for the relief of the sufferers.

## A JUDICIAL RECONCILIATION.

AMONG the present representatives of the Antwerp School of Painting, there is not one who is more esteemed than M. PIERRE-JEAN VAN DER OUDERAA. This is as much owing to the artist's modesty as to his great abilities in painting. M. VAN DER OUDERAA does not pose as if he desired people to believe that he was one of the successors of RUBENS, for he is as unassuming as if he were no more than one of the ordinary burghers of the old city. Indeed, M. VAN DER OUDERAA takes his turn in all the duties of citizenship, and his name sometimes appears as a committee-man, and sometimes as a candidate, on the enormous placards which herald an election in Belgium. He does not put himself forward as an artist who has gained renown in other cities besides Antwerp, but as a plain man who is ready to make sacrifices for the municipality of which he is a member, or for a cause which has secured his faith.

The co-operation in public affairs has been rather advantageous to M. VAN DER OUDERAA. From his interest in proceedings of a judicial and civic kind, he is naturally led to consider how they were transacted in a former age, and M. VAN DER OUDERAA is able to paint such scenes as the one we illustrate with an air of reality that is sufficient to convert the most obdurate realist to a belief in the advantages of historical pictures. His works are revelations of the past. It was this quality of verisimilitude which made M. VAN DER OUDERAA appear in the eyes of the authorities to be the best qualified to paint pictures for the walls of the Law Courts of Antwerp.

The *Réconciliation Judiciaire*, from which we are enabled by the courtesy of M. VAN DER OUDERAA to publish a plate, is not in the Law Courts, but in the public gallery of Antwerp. The reconciliation was one of those scenes which exemplified the Christian spirit which so far prevailed in Antwerp as to inspire the laws. When, as sometimes happened, men fell out, and one was killed, the life of the murderer was, of course, forfeited. Indeed, in those days death was the penalty of more venial offences. But the Antwerp judges were honest enough to feel that they could relish passion, and that "the rarer action is in virtue than in vengeance." The culprit's life could be saved, but in a nobler way than by the granting of an emperor's or a governor's respite. If the man or the woman who suffered most by the loss of the man who was slain could be persuaded to believe that the office of mercy was to confront the visage of offence and to accept a kiss of peace from the murderer, then he was pardoned.

But the reconciliation had to be conducted under prescribed conditions in order that it might be entirely deliberative. The first officer of the dignity known as the Amman had charge of the arrangements. He was known as the *lange roede*, from the rod he carried. He selected men to represent the accuser as well as the accused, and they could nominate an umpire in case any difference of opinion arose between them. If the reconciliation was agreed to, the final ceremony took place generally in a chapel dedicated to the Blessed Virgin. The procession was made up of the *lange roede*, the arbitrators, ushers, and inferior officers of the Amman. The culprit walked with them, clad in the way shown in the illustration—that is, barefooted and bareheaded, wearing a white shirt, and bearing a long straw in his hand, evidently with the intention of recalling CHRIST's passion. The nearest representative of the murdered man, his eldest son or eldest daughter, also came surrounded by relatives and friends. The culprit humbly begged pardon from them for CHRIST's sake. If no sudden impulse intervened to alter the arrangements, a token of pardon was offered by allowing a kiss to be given by the murderer. The clerk of the *lange roede* completed the ceremony by reading the formal record of the reconciliation.

In the original picture the lady who makes a sacrifice of her resentment appears like one who has come from the tomb. The torture of the ordeal is for her more exhausting than for the murderer, although he is not oblivious of his crime. The other members of the family of the victim are represented as under different emotions. The old father may be supposed to feel that—

We do pray for mercy,  
And that same prayer doth teach us all to render  
The deeds of mercy.

But the two sons are compelled to keep their looks from the murderer, and the clenched hands of the youth as he holds his cap suggest that he also is not satisfied.

The picture is finely coloured, and indeed no work in the gallery where it is placed leaves a more lasting impression on the mind of the visitor.

## THE ST. GEORGE'S BATHS COMPETITION.

THE following correspondence has been sent to us for publication:—

*To the Vestry of St. George, Hanover Square, re New Baths and Washhouses.*

9 Victoria Chambers, Westminster: June 5, 1888.

Gentlemen,—I have been requested by some of the architects who were invited to compete for the above to express their feeling of dissatisfaction with regard to your decision in the above competition. The competitors were assured in the instructions from the Commissioners that an architect of established reputation should act as assessor, and as in the cases of the Admiralty and War Office, the Law Courts, the Glasgow Town Hall, the Manchester Town Hall, and all public competitions, this was understood to imply that the assessor's decision was to be final and binding, unless some just cause could be assigned for acting to the contrary. The competitors are surprised to find from the Commissioners' report that they have rejected the design which the assessor selected, and moreover have declined to produce his report. And, further, that the design selected by the Commissioners, according to their own statement, is defective, and will require "to be considerably elaborated and a few modifications" made in it. They are also surprised that, as the selected design cannot be carried out for the amount stipulated in the instructions, viz. 30,000*l.*, that this fact of itself did not disqualify it. As the competition has entailed a large expenditure of time and labour on the competitors, they respectfully request that you will in justice to them reconsider your decision, and act on the assessor's award, and also publish his report.—I have the honour to be, Gentlemen, yours obediently,

JAMES WEIR, F.R.I.B.A.

St. George, Hanover Square  
(Commissioners for Public Baths and Wash-houses),  
1 Pimlico Road, S.W.: June 29, 1888.

Sir,—Your letter, dated 5th inst., addressed to the Vestry, was read to the Commissioners at their meeting yesterday, and I was instructed to inform you that the Commissioners see no reason to take any further action in the matter.—I am, Sir, your obedient servant, (Signed) F. W. DOGGETT, Clerk.

James Weir, Esq.,  
9 Victoria Chambers, Westminster, S.W.

## LICHFIELD CATHEDRAL.

IN commencing the restoration of the south window of the Lady Chapel, a work which has been long needed, it was discovered, says the *Staffordshire Advertiser*, that the mullions, apparently of stone, were nothing more than Portland cement, plastered round an iron core, which, by rusting, had so disintegrated the cement that on being touched it crumbled away. This was the case with all the mullions save the centre one, which was of inferior stone and not of the same nature as the rest of that part of the cathedral, whilst the mouldings were inferior in design. This incongruous work was probably done at the end of the eighteenth century, when so much of the other bad work was done. The work of the restoration of the east end is progressing surely, if slowly, and three windows have been taken out and replaced in a perfect manner, including the east window. New figures have been placed in two southern buttresses of the Lady Chapel, and the stonework on that side generally restored under the watchful care of the Dean. This part of the cathedral being named the Lady Chapel, the Dean has arranged for the niches in the restored buttresses to be occupied by figures of female saints from the Old and New Testaments. In the upper niches will be placed the Old Testament figures, and in the lower the New Testament figures. In

the buttresses already restored at the south and south-east angle of the Lady Chapel the figures placed are those respectively of Rachel and Phoebe, and Miriam and Lydia; whilst in the buttress further eastward the figures of Deborah and Martha are about to be placed. In the buttress now undergoing restoration the figures are to be those of Rebecca and Elizabeth.

### THE CHURCH OF ST. MICHAEL-LE-BELFRY, YORK.

A MEETING of parishioners will be held on the 24th inst. to consider what steps should be taken to preserve the above church, which is at present in a dilapidated condition.

The following is the report of the architects, Messrs. Demaine & Brierley, upon the building:—The stone used is from the neighbourhood of Tadcaster, and of the same species as that of the Minster. It appears, however, not to have been very well selected, and a good deal of the work, especially the carved and moulded parts, are in a very rapid state of decay. The mullions, jambs, arches, and tracery of the windows are in a very dilapidated and crumbling condition. In several places the stone is almost worn through and unsafe. The whole of the weathered or decomposed stone should be very carefully cut out, and new stones worked to the same sections let in. This will incur taking out the glass, which should then be refixed, and it will probably be found necessary to renew several of the stay bars and the casements. The moulded and panelled string under the windows on the south side is very much weathered and decomposed, although we understand it has been replaced within the memory of old parishioners still living. This is owing to its not having been set on the quarry bed of the stone. Almost the whole of this on the south side should be cut out and renewed. Parts of the moulded plinth and cornice and many of the stones in the ashlar walling, buttresses, &c., are very much worn, and should be cut out and renewed, and it would greatly improve the appearance of the church if the pinnacles were again provided to the tops of all buttresses where they are missing. Several stones of the mullions of the belfry are much worn, and should be cut out and renewed without delay, as the exceeding lightness of the structure leaves a very small margin of stability. There have been small pinnacles to the tops of the angle buttresses, which should be replaced with copper ties. The clerestory windows are in somewhat better condition, and we have not included them in this report or estimate.

### THE ARMS OF BATH.

IT appears that the representation of the arms of the city of Bath, which Major Davis, the architect, has set up in the Guildhall, does not meet with the approval of the authorities, who doubt the accuracy of the heraldry. The following defence of his design was written by Major Davis, and appears in the *Bath Herald*:—

Gentlemen,—The correct representation of the arms of the city of Bath is of such public interest and importance that I thought it advisable to make a written statement, which the public will be capable of estimating, and I must ask your patient attention for a few minutes, while I review the question so far as it concerns myself. As I have been given to understand, some gentlemen are prepared to charge me with having incorrectly represented the city arms on the Guildhall, and, if this attack fails, others are then ready to come forward and blame me for not having consulted my committee. On the first count I hope to be able to demonstrate that I have been faithful to historic truth. On the second count I shall have to remind you that this historic truth was authoritatively settled in 1862, and that the principle then accepted by the Corporate Property Committee has been continuously followed by me as a perpetual instruction on various occasions, which should be within the knowledge and memory of some of you, without calling forth censure or even criticism. If, therefore, the first part of the charge breaks down, the second must fall with it. Shortly after I was appointed in 1862 to succeed the late Mr. Manners, as city architect, I began to emblazon the city arms on a seal to be used by myself in the exercise of my office, but finding that according to the rules of marshalling and emblazoning arms I could not represent in the correct proportions the "two bars wavy" in chief, I applied for instructions to the Heralds' College in London. The Heralds' College, or more properly the College of Arms, is an institution held under the Crown and presided over by the Duke of Norfolk as Earl Marshal, whose officers are three kings at arms, six heralds, and four pursuivants. No coats of arms can be authoritatively borne unless they have been sanctioned by the College of Arms, or registered in their books as being borne from time immemorial.

On making inquiries of this, the only responsible body, I was informed that the conventional arms of Bath were looked upon by the college as the unauthorised invention of an engraver (I believe the Dutchman Van Houe, 1610?) and that they were so noted in the college register, but that the ancient coat had a history commencing "from time immemorial." I had the satisfaction of seeing this record in the college books. I have also subsequently seen the original copy of the record of the last Visitation of Heralds to Somerset. A Visitation of Heralds was a commission appointed by the Earl Marshal, with the consent of the Crown, to require the production of all coats of arms and heraldic seals, in order that they might be confirmed or disallowed. The last Visitation of Heralds was held in the year 1623, at the "Harte Lodgings over the Kinges Bath;" and upon presentment of the Mayor and Corporation the ancient arms were again registered and allowed, as also the civic seal and that of the Mayor, but not the seal now in use by him. I was introduced to the Heralds' College by the Rouge Croix Pursuivant, Mr. Planché, who showed me the ancient arms, which in heraldic cant represented a City of the Waters—a signification which the spurious representation of the engraver could not boast. For further confirmation Mr. Planché, who was subsequently Somerset Herald, referred me to the arms of the city as they were modelled and "tinctured" in the ceiling of the nave of the Bath Abbey. Those arms of Bath were placed in their original position by Bishop Montague, Chaplain of the Order of the Garter, previous to his translation to the See of Winchester in 1616, and were within your memory replaced by Sir Gilbert Scott on the restoration of the Abbey.

I laid the result of my inquiries as to the correct arms of the city before the Corporate Property Committee in June 1862, and I was instructed to rehabilitate the ancient arms (see minute, June 1862) and to emblazon my seal at their cost (see Corporation accounts) with the correct arms, a copy of which I now lay before you. I had previously been so fortunate as to find hidden away beneath the roof of the Guildhall two metal maces, made in the year 1732 by the founder of *Keene's Bath Journal*. I was requested in pursuance of the minute of the Corporate Property Committee to have the arms of Bath engraved and also painted on these maces, according to the version of the arms as registered at the College of Arms. I obeyed my instructions, and these maces, bearing each two coats of the correct arms, have been carried before the Corporation in all processions or visits of ceremony. Since that date (1862) the Corporation have in all matters in which I have been employed had the correct arms used. I would first mention the arms in the east window of the abbey. By your request I prepared a drawing of the coat of arms to be used for the heading in all advertisements in the public papers, which has uniformly been used, also for the heading of the summonses to the Council and sections of the Council, but the printer thinking the spurious arms the prettier has not been invariable in his allegiance. In 1864, at the meeting of the British Association, the correct arms, surrounded by the civic chain, were engraved for the service of the Mayor. This seal was largely used on the occasion, and most of the succeeding mayors have preferred this heraldic shield for invitation cards, &c., to the modern version of the ancient gateway that has displaced the authentic seal. The album issued in the mayoralty of Mr. Alderman Bartrum to the lodging-house keepers has the correct arms on every sheet, and also to a larger scale on the binding, also the subscription books at the Baths, and the several works on the Baths and Bath which have been bound at your expense. At the Health Exhibition in London, in 1884, a banner, which was embroidered on a large scale with correct arms under the superintendence of a councillor of the Bath Corporation, was placed over the Bath exhibit, and attracted much attention from the visitors. This was afterwards sent to the New Orleans Exhibition. The books on the Baths which I had the honour of presenting at your desire to Her Majesty, and also to the Princess of Wales, had the correct arms executed at very considerable expense on costly binding. Mr. Peach, in his "Historic Guide," placed the correct arms from my drawing on the covers of his books, and Mr. King and your deputy town clerk, Mr. Watts, did likewise in their recent work on the Municipal Records. Mr. Alderman Hunt's portrait in the banquetting-room has the correct arms marshalled with his own.

Errors are difficult to overcome. The badge you have placed on the police bears the spurious arms, and the Bath College Company, ignoring heraldic lore, have been likewise faulty in heraldic grammar. I am in no way to blame for these mistakes, neither is it my fault that your Mayor's badge is also "ignoble" heraldry, as that was given by the citizens to Mr. Alderman Dowding, when Mayor, twelve years previous to my appointment. The city maces, bearing the incorrect arms, were purchased in 1708, but when I mention that the ancient maces of the city formed a portion of the purchase money for the new maces, you will see that our ancestors in the time of Queen Anne were not much influenced by a historical spirit or by a veneration for antiquity, and therefore not likely to have

been careful that the ancient arms should have been placed on their newly-made maces. The discarded maces are, it is believed, those carried at the present time before the Mayor of Stratford-on-Avon.

I must apologise for going so fully into particulars, but I am compelled to state my position, and I could not do so in any other way. I consider that I should have no justification for inserting or using a false armorial bearing on any work which you may commit to my care; but, at the same time, I believe that without your instructions I should, as a matter of taste, permit a decoration on your buildings erected in the past, false heraldically as it may be, so to remain, if it were possible not to interfere with it. I can point as an illustration to the way I have decoratively treated the arms in the banqueting-room and in the common hall.

The restoration of the Guildhall front revealed a state of decay not anticipated, and when I examined the city arms as there represented, I observed that the stone carving was so detached that no piecing the shield was practicable. If this had been possible I should have at once patched and retained the false emblazonment; but I found that to retain the bearings I should have been obliged to place an entire new stone. A new stone would have entailed a new shield, which I should have been bound under the minute of 1862 to replace with the ancient authorised arms. A practical man will understand me when I state that the extreme projection and indentation of the carving taking the place of where the new work would have to represent water, made the transference in the old material possible; so I decided upon executing it in this way—a procedure for which I claim justification.

I have seen a letter from the Mayor, in which he states that the water was shown above the battlements in the conventional shield. Let me assure you that what his Worship describes as water should rather be called "streamers" or "bars wavy," and that as I have represented the arms there are no battlements so called, but square piers, as of a bridge through which the water (the mineral water) is flowing. His Worship also speaks of applying to the Ulster King-at-Arms. The Ulster King-at-Arms is an Irish Herald, and could only speak as a layman, and without official authority in matters of English heraldry.

If I am considered to have committed an error on a point of heraldry the committee can obtain from the Garter King-at-Arms, or the Somerset Herald, the opinion of the College of Arms, which would be of the greatest value.

I have now, gentlemen, laid before you facts sufficient to prove that the city arms now placed by me on the Guildhall have not been, as some would have you believe, designed capriciously and without precedent, but in a spirit of faithful adherence to historic truth as authoritatively laid down by the Heralds' College and so accepted by you in 1862; and the general principle then established and subsequently carried out by me on various occasions, without evoking censure or even criticism, I have always regarded as a perpetual instruction.

## THE CISTERCIAN ABBEY OF LOUTH PARK.

THE members of the Louth Antiquarian and Naturalists' Society were lately conducted over the ruins of Louth Park Abbey by Alderman James Fowler, architect. In addressing the members, he observed that little was known of the history of the abbey beyond the foundation and the dissolution; not even could a complete list of its abbots be made out, and but little of its once grand buildings remained from which could be traced their architectural features. The grassy mounds told of its size and arrangement, and doubtless under these mounds some treasure might be found which would enable a complete plan to be made. The foundation was of the Cistercian Order, and was one of the earliest of the offshoots from the head of the Order in England, viz., Fountains. The church was the central feature. This was of large size, being in length 256 feet and 61 feet wide. The transepts were 125 feet across, by a width of about 48 feet, including the chapels. The chancel was about 40 feet long and 26 feet 6 inches wide, and was nearly as large as the parent church of Fountains, being only 6 feet shorter. It might be taken roughly as about half the size of Lincoln Cathedral. Its construction was most massive, and judging from the remains of one of the pillars, the walls were about 6 feet thick. The style of the building was what is called Transitional, or the change from Norman to Lancet work, and it was in these buildings that the Pointed arch was first introduced. Buildwas Abbey, founded in 1135, was said to be the earliest example of this work, but as other buildings were then being erected it is not easy to say which is really the first. It was not, however, completed at once, because there were fragments of mouldings of the succeeding style, and it was hardly to be supposed that such a grand work would be completed in a short time. Some portions of the west end of the nave, one of the pillars of the north arcade, the north and south

walls of the chancel for some height, and the east walls of the same and the transept chapels are the only portions remaining above ground, but the wall of the north aisle of the nave may also be distinctly traced. All the monastic buildings were on the south side of the church, and were, as usual, arranged round the cloister. This was about 120 feet square. The chapter-house on its eastern side was about 50 feet by 30 feet, and had a vaulted roof supported by six pillars, and from the remains found it was possible that it was not erected until the early part of the thirteenth century, Richard de Durham then being the abbot, in 1246. The site was a peculiar one, being open and exposed, but it was well protected, having a broad moat around it, enclosing some twenty-three acres, and within this was another and smaller moat enclosing the main buildings. These moats were supplied with water brought from St. Helen's spring at Louth by a dyke cut by the monks, which still bears their name. The inner moat was enlarged considerably on the north-east of the abbey, and formed into a large fish-pond. These moats were now dry, the water and the dyke being conveyed along the south side of the abbey to and through the adjoining parish of Cockerington. The material used in the erection of these buildings was chalk, but the external walls and pillars were either of green sandstone or Yorkshire limestone. For a period of about 400 years, viz., till 1535, this grand monastery flourished, and had considerable possessions in various parts of the country; and in 1291, when it was probably at its best, their value was 246*l.* 9*s.* 3*d.*, when there were 66 monks and 150 conversi or lay brothers, making 216 to be provided for daily, besides strangers. The income was so mismanaged that at the dissolution in 1535 it amounted to 147*l.* only. The Abbey of Louth Park was founded by Alexander, Bishop of Lincoln, 1123-48, and in 1139 a company of monks, who had been sent from Fountains, commenced the erection of their home in the Bishop's Park at Louth.

## ARCHITECTURAL DRAWINGS.\*

WE speak loosely of architects exhibiting "examples of their works," and we annually see articles headed "Architecture at the Royal Academy" and elsewhere, and there is small blame to the public if they are misled by such expressions and if they utterly lose sight of the fact that in the nature of things it is impossible that a work of architecture can be exhibited except where it stands. It seems almost as if architects themselves were in danger of falling into the same forgetfulness. This would not merely be a mistake, but a calamity. Nothing perhaps has done more to degrade architecture both as a profession and as an art than the popular misconceptions which these exhibitions tend to foster; and the question whether such exhibitions ought not to be entirely discontinued is one which demands the most anxious and careful consideration of every one who is really interested in the art.

It is probable that for reasons quite apart from the interests of art such exhibitions will continue. It is therefore all the more incumbent on us on all fitting occasions to protest against the idea that they are exhibitions of architecture. They are exhibitions of drawings of architecture, which, as we shall presently see, is a very different thing. Many of these drawings possess great artistic merit, even when the architecture they illustrate is contemptible, but it may be fairly suggested that if the interest is to turn on the work of Haig, or Brewer, or Davidson, it would be very much better to leave these artists free to work at their best among the monuments of Westminster or the terraces of Mont St. Michel, rather than under the harassing limitations which the modern designer is obliged to impose. But the very best efforts of the best artists cannot enable the architect to exhibit his art in the same sense that the sculptor or painter exhibits his. The architect acknowledges no superior in the world of art, and before his masterpieces the greatest achievements of the sister arts sink into comparative insignificance, but in the modern exhibition he cannot possibly assert his pre-eminence. The truth is that between the exhibition work of the architect and that of the painter or sculptor there is absolutely no analogy: so true is this, indeed, that it is not even possible to imagine corresponding limitations applicable to each. If, for example, the sculptor could only exhibit a part of his statue—a half either way, or even a leg only, or a hand—he would not be in the same unhappy case as the architect represented by a perspective drawing; because he might still make what he did exhibit perfect—a faultless example of the sculptor's art; but the architect can only hope to make the perspective a faultless specimen of another art altogether—the art of the etcher, not of the architect. The beauty of detail, the harmony, fitness, truth, sublimity, are not there, and cannot possibly reach the mind through the medium of pen and ink. In the same way the painter, if denied the use of colour and restricted to black

\* From an essay by Mr. J. Honeyman in the *Scottish Art Review*.

and white, would not labour under the same kind of disadvantage as the architect. He would still be free to show his best in monochrome, and in spite of the limitation might produce a consummate work of art—the painter's art; but there is no such possibility open to the architect: a consummate specimen of his art can only appeal to the imagination and the emotions through the medium of stone and marble, oak and cedar, gold and azure.

Again, whatever style may be adopted in illustrating a piece of architecture—whether etching, monochrome, or water-colour—the drawing is necessarily in a double sense conventional. It is conventional not merely in the sense that painting, sculpture, or architecture itself is conventional—namely, subject to the restrictions which the materials employed by the artist impose—but in the further sense that it is a conventional way of representing a conventional thing. A painting is not; it is the thing itself. So is a piece of sculpture; so is a piece of architecture. But a drawing of any of these, however excellent in itself, is after all only a conventional representation of them. It is comparatively uninteresting and valueless, and the less it does justice to the original the less it is esteemed. No one who can paint would dream of resting his reputation on the popular appreciation of such imperfect presentments of his art. He, jealous for his art, would refuse to exhibit if he had always to submit to such misrepresentation; but the architect who exhibits has no alternative—he must, in short, submit to be misrepresented. Besides, it must not be forgotten that, while it is possible to represent conventionally, by drawing, sculpture, or painting, so completely as to give some adequate conception of the whole work, it is impossible so to represent a work of architecture. That can only be shown in part—probably an insignificant part. The immense difference which this makes will be readily understood by artists, but a simple illustration may not be amiss. In the Glasgow gallery, among the many good etchings, are two by Mr. Alex. M'Gibbon, of parts of Glasgow Cathedral. Consider how many such drawings would be required to represent even in this soulless, conventional fashion all the charms of that one magnificent work of art! The lifelong labours of a Prout or a David Roberts would yield but a sorry substitute for the original, and transmit to us not even an echo of its harmonious and impressive eloquence. So it is in varying degree, but unvarying certainty, with every work of architecture. The architect, like every other artist, speaks through his art, which even in these degenerate days may be made the vehicle of a noble language; but if he should masquerade as an etcher or a water-colourist, let him use the appropriate accessories and the appropriate tongue—not an unintelligible jargon; and above all things let him make it perfectly plain that he is not exhibiting himself as an architect, but that he desires his art to be judged by what he does in his true character, and by that alone. How different would our estimate be of the artistic merit of men like Inigo Jones or Wren if we had only their drawings to guide us!

### THE LIVERPOOL THEATRES.

**A**DJOURNED special sessions for hearing applications for theatrical licences were held last week. Sir James Picton presided.

The Chairman said that since they last met on the subject which had again brought them together a good many things had happened. There was a committee appointed by the magistrates to inspect the theatres, and with the able assistance of the city engineer and the city surveyor a thorough and complete inspection of all the theatres had been made, and a mode adopted with regard to the necessary precautions against fire and stampede. The best plan would be that the report which had been prepared by the committee should be read.

Mr. Ellis (magistrates' clerk) then read the following report, which was dated the 27th ult.:—At a special meeting of the city justices held on September 28, 1887, a committee was appointed to inspect the theatres within the city, with reference to the provision for the safety of the public in case of fire or panic. The committee was constituted as follows:—Sir J. A. Picton (chairman), Messrs. John Brancker, T. Holder, John Hughes, H. W. Meade-King, G. Behrend, H. H. Hornby, S. H. Holme, Henry Jevons, R. Gee, M.D., and William Oulton. After a thorough personal inspection, instructions were given to the city surveyor and city engineer to prepare plans of the buildings, and to present separate reports and recommendations as to the alterations necessary for the public safety. These plans and reports were duly prepared, and after consideration by the committee were brought up at a special meeting of the justices on March 21, 1888. The following resolution was thereupon carried unanimously:—"That the report of the committee be received and adopted, and that the committee be reappointed, with authority to carry out their recommendations, subject to such modifications as they may see fit to grant. The committee have held numerous meetings, have renewed their personal inspection

of the buildings, and have held various conferences and consultations with the lessees and their architects, assisted by the city surveyor. They have pleasure in reporting that they found on the part of the lessees every desire to carry out faithfully the recommendations of the committee. It may be interesting to the justices and to the public to make known the leading features and objects of the alterations agreed to which are now being carried out. The most important of all is protection from fire. It is an established fact that in every recorded case of fires in theatres the origin has been on or behind the stage, but in no instance has the fire broken out in the auditorium. If, therefore, a solid wall of sufficient thickness is built, entirely separating the two portions, the few necessary openings being fitted with iron doors, the only difficulty to be dealt with is the stage opening or proscenium. The combustible curtains hitherto adopted are dangerous in the extreme, and have led to very serious loss of life by the panics and stampedes arising from fright. Curtains of non-inflammable material have been adopted as at Exeter, but have failed in consequence of their flexibility and want of substance. The committee have had before them various designs and plans, and have inspected some which have been carried out, particularly that of the Prince of Wales's Theatre in London, which seems to comprise everything which can be desired for the public safety. The main requirements are (1) that the material shall be incombustible, consisting in great part of iron; (2) that it shall be rigid, not liable to be deflected or bent; (3) that the means of lowering or elevating it shall be ready, simple, and easily worked. There are several modes of carrying out this principle according to the extent of the opening and other circumstances, but all consist of double plates of iron, in one case hollow, the others filled in with silicate of cotton, which is incombustible. Even in the present state of the theatres, if these recommendations are carried out, there could be no danger of panic, since the audience might withdraw without danger in the most leisurely manner; but, acting on the report of the city surveyor, a number of alterations have been suggested—of widening the exits, providing additional openings, improving the staircases, and in some cases constructing additional ones. These have been agreed to by the lessees, and are now in progress in the following theatres:—Alexandra, Court, Rotunda, Grand (or Varieties), Adelphi. Nothing has yet been done at the proscenium of the Prince of Wales's Theatre, though the lessee has expressed his willingness to comply with the requisitions of the committee. The alterations at the other theatres are in progress, but cannot be quite completed before the licensing day.

The Chairman said that if the alterations in the theatres were carried out, as he had no doubt they would be, in accordance with the instructions in the report, the public might be perfectly satisfied that every practical precaution had been taken against fire on the one hand and panic or stampede on the other. He was very glad to be able to say that there had been every desire on the part of the lessees to comply with the requirements. The alterations were not all completed, but under the superintendence of the city surveyor there was no doubt they would be.

### A College of Architecture.

SIR,—As my remarks on this subject have appeared to you to merit the consideration of your subscribers, I shall be glad to be allowed to add a few words, as the desirability of converting the proposal into reality is acknowledged by all whose opinion I have asked; although there is, of course, some variation as to details which can only be settled at a general meeting of persons much more competent and experienced than myself.

The late lamented President of the Institute was not only an eminent practical architect but a man of very large general experience, and I have been so fortunate as to find that, in an address at the opening meeting of a session, he adduces many facts with a view to reform and improvement which appear to apply with equal force to this proposal for a college. He said:—"I feel bound to offer a remark on the present incomplete representation of architecture at the Royal Academy, and an expression of regret that the careful recommendations of the Royal Commission of 1863, which were intended to improve the character of that representation, have been totally disregarded." Here we have our honoured architectural leader lamenting that architecture is in bad case, but crying out to another Society, instead of his own, for help for the remedy.

Then as to "organisation," he says there are principles which may be established as a basis, e.g. examination and the constant interchange of communications relating to the art, science and profession of architecture. I am, therefore, an advocate for systematic teaching.

These few brief extracts show that in the opinion of the highest officer in our profession there is a crying want for some change that shall lead to improvement, rendering it easy and natural for our students to pass through such a bracing curriculum as will not only lay a sure foundation for future success, but will compel the public to look with as much respect upon an architect as it does upon a clergyman.

Commenting upon the President's address, the *Times* paper of the next day has the following remarks:—"There are good grounds for the President's statement that the apprenticeship system requires to be supplemented. The mere fact of a young man's having been the articulated pupil of a qualified architect is not a sufficient guarantee of his own qualifications. Some evidence of proficiency should be required further than that of having sat for a certain number of hours in an office."

The conclusion I draw from all this is that every architect should inform every parent proposing to place his son in the profession, that the first step will be a course of collegiate training which an office cannot supply. The arrangements might be such that the time occupied would be longer or shorter, according to the natural quickness or acquired knowledge of the pupil. I say pupil, because I think his articles might properly commence when he entered the college, it being understood that his master would take a personal interest in his work there, and perhaps occasionally invite him to the office when there happened to be something going on that it would be well for him to learn. All this, however, implies a college, which is the most economical means of giving a particular education to large numbers of persons.

If I am not over sanguine as to the advantages of this proposal, and, assuming that the college would be established in London, there can be little doubt if influence—easily obtainable—were brought to bear on the Royal Commissioners of 1851, a site would be given for the College of Architecture at South Kensington, which has the advantage of already-formed museums of art and science. The annual expenses of the college would be comparatively small, as all the required professors and teachers are resident in London.

The trouble, loss of time, and inconvenience to a young architect in obtaining anything like a satisfactory training, at the present time and under existing circumstances, as compared with the facilities he would experience of living for a few months in a college with its lecture theatre, laboratory, and work-rooms, are too obvious to require much urging. System and incitement would take the place of irregularity and chance. Instead of having to run hither and thither for a lecture on geometry or mineralogy, applied mechanics or experimental science, on chemistry or geology, he would find it going on under the roof of his domicile, at a time announced beforehand for his special convenience. In my article I forgot to include the physicians and surgeons among the professions having colleges. Thus all the important professions have felt the necessity of properly training their recruits by means of a college, except that of architecture, viz. the army, the navy, the engineers, the musicians, the surgeons, the physicians, and even the farmers.

Does it not, then, seem justifiable to attribute the admitted shortcomings in architecture—mother of all the arts—to our discreditable neglect and indifference? History shows that she will flourish only when she is warmly cherished, and persistently and untiringly cultivated with all the wisdom and knowledge that man has diligently acquired. Withhold this nourishment, and she quickly becomes weak, worthless, and debased. It was Thales and Pythagoras and Anaxagoras who originated the glory of Greek architecture. It was the possession of all the science of their age that enabled the Freemasons to cover Christendom with such marvels of architecture as have impressed us at Rheims, Milan, Paris, and Westminster with the weak and puny character of our own efforts, and the fear that on some grand opportunity happily presenting itself we might be found wanting in the very elements of success. Let us, then, hope that architecture will not much longer want its elementary necessity—a college for the adequate training of her disciples, so that in carrying out the work allotted to them they may be able to apply with marked effect the wonderful resources of modern science adorned with an art worthy of our epoch.—Yours, &c.,

THE WRITER OF THE ARTICLE.

[Should any readers desire to confer privately with our correspondent upon the subject of his letter, we shall be happy to receive and forward their letters.—ED.]

SIR,—It was with very great interest, but I must confess also with some little surprise, that I have recently read in your columns the article and correspondence advocating the formation of a college of architecture.

Why, sir, these gentlemen are advocating what already exists! True, there is no "Royal College of Architecture" under that name. But what's in a name? A good deal, some may say. Possibly. But often when a name has gone on for years and years, and has connected with it a sort of sacredness,

owing to its antiquity and associations, one becomes rather reluctant to change it. What I mean to say is, that in the Architectural Association we have a college—and a very popular and hard-working college—among whose students there exists as strong a feeling of *esprit de corps* as one could possibly wish to find.

Mr. Thomasson's project for a university, in its widest and most extended form, is, *prima facie*, a very taking one; but I am sure he will excuse my saying it is quite impracticable. Does he realise quite what architecture in the provinces is? Let me give him a little piece of information, which may serve to enlighten him a little on this matter. Some months ago a project such as he has indicated was set on foot, and it was thought that possibly, under energetic management, some national association or university might be founded. With this end in view a circular letter was sent to nearly every town in the British Isles, where there was a member of the Institute, and, where not, to the secretary of the local school of art. The recipients of these letters were asked "to furnish a few notes upon the position of architectural education in the town of — and surrounding district," and also to give their opinion upon the system of education that should be provided. A copy of the Journal of the Architectural Association was sent with the letter. What was the result? About 50 out of the 500 gentlemen addressed took the trouble to reply, and the majority of the replies we did receive were of a most unsatisfactory nature. "There is no architectural education here, nor is there any need for it." "The students in this town are divided into cliques, and would not on any account form themselves into an association." "It would be quite out of the question here to suggest the formation of an establishment for architectural education." "I am afraid your advances will be treated with the same apathy as have been those of the City and Guilds Technical Institute."

Now, sir, here we have an actual and determined effort made for the formation of a "University," and the result has at least convinced me that any attempt in this direction is foredoomed to failure. At all events, such a movement to be a success must be essentially local.

I hold almost the same objections to Mr. Hill's scheme. I cannot at all follow him in his assertion that "an art master to teach drawing, a professor of architecture to lecture on history, design, &c.," tacked on to an engineering school, will make a "complete school of architecture." The writer of the original article was surely nearer the mark when he said that a complete course of architecture was almost as complex and far-reaching a study as that for an Honour School in the B.A. examination at Oxford. Certainly; and I would therefore urge that, considering the comparative smallness in number of architectural students, a complete course of education can only be obtained by the concentration of our efforts in those educational establishments which already exist, and more especially in that great Metropolitan Association that has done so much in the past, and that means to do so much more in the future for the architectural student.

It may be urged against me that it is a serious undertaking for a young man to migrate to London for two or three years, and that the classes at the A.A. are merely evening classes, and, therefore, non-collegiate. For the first argument I am quite aware that it is a serious and expensive matter for men to come up to study in London, but then, if men want collegiate education they must pay for it. Medical students and law students have to do the same, and so must we. In support of this view I can only point to the many men who even now come up year after year from the provinces. At the last R.I.B.A. examination it will be seen that we passed men from Bombay, Adelaide, Rourkee College, India, and Melbourne, and I believe it is a fact that the Indian Government annually send one or two of their engineering students over to study with us. Then, again, for the second. Our classes are, it is true, mostly held in the evening, but then they are simply meetings for instruction and criticism. All the personal work and study, which is very heavy and exhausting, has to be done in the daytime, and when the student has liberty. And, moreover, the needs of those students who are not engaged in an office are very fully provided for by such institutions as Messrs. Baggallay & Millard's *Atelier* and Messrs. Tiltman & Wood's "College." Indeed, the system of study in the morning, recreation in the afternoon, study again in the evening, which is, I believe, the usual collegiate method of working, strikes me as being peculiarly adapted to architectural education in London at the present time.

I could dilate on this subject for some time longer, but space prevents. Let it now suffice to say that the best thing for gentlemen to do who are really anxious to promote the collegiate education of architects is to devote their energies to perfecting existing institutions, and, by founding local scholarships, to help those living around them to come up and study at our National College of Architecture, which

has been existing for so many years, and which all those who have studied, or who are studying within its walls, regard and venerate as their veritable *alma mater*.—Yours, &c.,  
OWEN FLEMING.

SIR,—Mr. Arthur Hill's letter last week has evolved another development to my scheme as then stated, and which, being a very important factor, I will therefore ask leave to bring forward now.

Mr. Hill's scheme is good, and on the "one" side cheap, but it is not inexpensive to the pupil himself. Attendance at university is beyond the reach of many—yea, most—which consideration is the main point of my scheme for a popular university on the S. K. system. Some there be who have weighed the Government method in their own particular private scales, and found it wanting. I cannot here enter upon that vexed question, but for the assurance of those persons I will show the one greatest difference between my proposal and South Kensington. In fact, the only likeness is in the administration of the whole; and now that I propose to add a travelling professorship to each one of the great divisional centres, the real difference will become more apparent. The young architect will be enabled to obtain the advice of all his seniors in his own city (and this will be most beneficial, as tending to correct narrowness of conception and a set officialism), he will be able to get all the books he should have; and as the professor attached to the centre of the division to which he belongs will periodically visit each district town, the student will not only be able to hear first-class lectures "at least once a quarter," but will be able to obtain the professor's valuable advice on any matter in difficulty. Not the least of the many and great advantages accruing therefrom would be that the professor might so prepare his lecture in each town as to illustrate it from the architecture—ancient and modern—in that city, thereby giving the students invaluable lessons in criticism, and providing them with a standard in their own midst. The happy results of such a procedure will be fully appreciated by all who have read Ruskin's "Lectures on Architecture" delivered to the good people of "Edinboro' City fair." The professor could conveniently arrange his chief lecture-room in the chief college in his centre: e.g. Mason College, Birmingham, would be the head-quarters of the Western Midlands.

Some such arrangement could not fail to commence to influence architectural style and building in a "truly" original and striking manner within two generations of pupils, taking a pupilage at four or even five years' duration—that is, in about one decade (ten years).

Such, then, is the main outline of the only scheme with which I am at present acquainted, which is likely to be of real use, and, as in the case cited above (Birmingham and its college), includes the making use of existing colleges, as suggested by Mr. Hill.—Yours very truly,

FRÉDÉRIC E. THOMASSON.

Worcester: July 3, 1888.

P.S.—A misprint occurred in my letter last week. In line 14, fol. 376, the word "provisional" should have been "divisional" or "provincial"—either.

### CHURCH BUILDING AND RESTORATION.

**Brindle.**—The old parish church of Brindle, near Chorley, has been reopened after restoration. Some time ago the galleries in this church were considered unsafe, and Mr. James Bertwistle, F.S.I., architect, of Blackburn, having been called in to make an examination, found that the whole of the beams were decayed with dry rot. It was immediately decided to close the galleries and entirely remove them. This has been done, and the whole interior of the church has been decorated. The exterior has been restored and pointed, and the old window on the ringers' floor in the tower, which was fast crumbling away, has been replaced by a new one. The exterior pointing and interior plastering have been executed by Mr. A. Airey, of Blackburn; the ornamental tiling, by Messrs. J. Dyson & Son, of Blackburn; the joiner's work, by Mr. Blackledge, of Brindle; and the interior decorating, by Mr. Bennett, of Manchester. The whole of the work has been executed under the personal supervision of Mr. Bertwistle. This interesting old country church now presents a greatly improved appearance, both externally and internally.

**Sunderland.**—A Presbyterian church is to be built in Stockton Road. The committee, who have visited several of the most recently erected Presbyterian churches in the kingdom, selected Mr. John B. Wilson, A.R.I.B.A., Glasgow, for their architect. The church will be somewhat similar in arrangement to the recently completed Crescent Presbyterian Church in Belfast, also designed by Mr. Wilson, and the buildings will comprise a church of 1,000 sittings, church hall for 750, lesser halls for 330 and 120 sitters, classrooms, session-

room, vestry, ladies' meeting-room, kitchen, &c., and also a large and well-equipped gymnasium. The style of the buildings will be Gothic of the thirteenth century period, and a principal feature will be a massive bell tower rising to a height of 140 feet.

**Troon, N.B.**—The foundation-stone of the proposed U.P. church has been laid. The building is designed in the Decorated style, and will comprise nave, with side aisles and choir, with tower and spire, vestry, ladies' room, and hall for 120 persons. Sittings will be provided in the church for 660 persons. Mr. John B. Wilson, A.R.I.B.A., Glasgow, whose design was selected in competition, is the architect. The contractors are:—Orr, McLean & Co., masons; James Ralley, wright; D. Walker, plumber and gasfitter; A. McSkimming & Son, plasterers; A. & H. Gilchrist, painters and glaziers—all of Troon; W. Darrie, Glasgow, slater.

### NEW BUILDINGS.

**Olton.**—Mr. James Kent, of Birmingham, the owner of an estate of about one hundred acres at Olton, some six miles from that town, has now completed the first block of villa residences erected on the estate, and purposes to erect sixty-seven similar residences, and form several new roads. Each of these houses will consist of drawing and dining-rooms, kitchen, pantries, scullery, outbuildings, wine and ale cellars, and four spacious bedrooms. At Sparkhill (about two miles from Olton) the architect has prepared plans for fifty villas, which are progressing rapidly. These houses are somewhat similar in arrangement to the above. The design of the whole of the buildings is Gothic in character, ornamental brickwork, terracotta, stonework, Minton's tiles, ornamental woodwork, &c., being introduced. The total cost will be about 25,000*l.* The architect is Mr. J. Statham Davis, of 53 Newhall Street, Birmingham.

### GENERAL.

**The Queen** has consented to lend *Chantrey's Studio*, by Sir Edwin Landseer, for the autumn exhibition in the Wolverhampton Art Gallery.

**Mr. W. J. Bishop**, who was art master in the Liverpool College for forty-three years, died on Monday in his eighty-third year. He was president of the local Academy of Fine Arts for nearly as long a period.

**The Gambetta Memorial** in Paris, of which M. Boileau is the architect and M. Aube the sculptor, will be unveiled on Friday next. It stands near the roadway across the courtyard of the Louvre, and opposite the Arc de Carrousel.

**M. Crauk** is now erecting his group of sculpture in the pediment of the new Luxembourg Museum. The subject is "Glory distributing rewards to the Plastic Arts."

**M. Carnot** has resolved to use the palace of Fontainebleau, and the French Chambers will have to vote 6,000 francs to put the rooms in order.

**The Chester Archaeological Society** will issue a volume containing reports of the discussions on the origin of the walls of Chester, which by some authorities are supposed to be Roman work.

**Mr. T. C. Coulthurst**, who was borough surveyor of Derby since 1879, has died in St. Thomas's Hospital of general paralysis. He was formerly an architect in Barrow-in-Furness, and the first Board school in Derby was erected from his designs.

**A Subsidence** occurred on Cradley Heath, near Birmingham, on Sunday and Monday, causing damage amounting to 14,000*l.* The Methodist chapel has sunk 2 feet, and is much damaged in consequence.

**The Worcestershire County Magistrates** on Monday approved of a report of the police committee recommending the purchase of a site at Clent for the erection of a police station, plans for the same, with estimate of cost, to be prepared by the county surveyor.

**The Building Trade** in Leicester was, at the quarterly meeting of the Town Council, stated to be in a healthy condition, the number of plans passed during the quarter exceeding by 113 the number in the previous quarter, and by 55 the number in the corresponding quarter of last year.

**Mr. Ernest Rüntz**, architect and surveyor, has gained the silver medal for fine art and the first prize for drawing, at University College.

**The Dunfermline Parochial Authorities** on Tuesday decided to purchase the McLean Hospital, to be used as an adjunct to the Poorhouse, which is at present too small, and to unite with the Burgh authorities of Dunfermline in erecting a permanent hospital for the treatment of infectious diseases.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JULY 6, 1888.

GREAT CONTRACTORS.—No. 13.

MR. JOHN MACKAY.

**MR. JOHN MACKAY.**

THERE are few contractors who can boast of having been actively engaged in the construction of public works for a longer period than Mr. John Mackay. Yet he has not reached his seventieth year. He was born in 1822, in the parish of Nogart, Sutherlandshire, and, after passing through the curriculum of the parish school, and gaining a sound knowledge of Latin, Greek and mathematics, he wisely entered the service of the late Thomas Brassey in 1843. He remained with Mr. Brassey until the death of that famed contractor, when he commenced business on his own account. As Mr. Brassey's representative Mr. Mackay was implicitly trusted by his chief, and it is calculated that, during the period of his agency, Mr. Mackay constructed on an average thirteen miles of railway every year. At one time he had as many as nine different contracts in the Midlands, all going on simultaneously. "My dear John" was Mr. Brassey's right-hand man in the Midland Counties, and is favourably noticed by Sir Arthur Helps in his "Life of Thomas Brassey."

Mr. Mackay has carried out several large contracts on his own account both at home and abroad. Amongst these may be mentioned the Dowlais Tunnel, the Swansea and Clydach Railway, the Cardiff and Ogmore and Llynvi Branches, the Princetown Branch, the Southsea Branch, the Treforest section of the Barry Dock and Railways, and many others. Abroad his name will be honourably associated with the Waterworks of Port Elizabeth and King Williamstown, South Africa, and the Government railways of Jamaica.

No man has a better idea of the value of work and, when tendering this year for the third section of the Thirlmere Waterworks, there was only a difference of 175% between Mr. Mackay's tender and that of the present contractors for the second section, out of an amount of over 100,000%. Mr. Mackay is a great friend of the crofters, and gave valuable evidence for them before the Royal Commission. He is held in such esteem in his native country that at the last election three seats in Parliament were offered him, and, had he stood, there is no doubt he would have been returned at the top of the poll. Mr. Mackay largely assisted Professor Blackie, with pen and purse, in the establishing of the Celtic Chair in the University of Edinburgh, and the debt of Scotsmen to our

contractor was acknowledged by the enthusiastic Professor in the following sonnet:—

Who love the Highlands? Not with murderous guns,  
Who scour the moor, and chase the flying deer;  
Who lure the speckled troutling from the mere;  
And hook the strong-nosed salmon, where he runs  
Cleaving the adverse flood. These love their sport;  
But thou, Mackay, dost love the stout-thewed men,  
Whose sweatful toil redeemed the stony glen,  
And filled wide Europe with the proud report  
Of their high daring deeds; and thou didst stir  
In fresh young hearts brave memory of their sires;  
And mothers hailed in thee God's minister,  
To fan the slumbering flame of patriot fires.  
Who loveth thus loves well, and nobly wise,  
Weds earth to heaven with worth that never dies.

**CONTRACTS OPEN.**

ASHTON.—July 12.—For Building Baptist Chapel. Mr. T. P. Worthington, Architect, South Shore, Blackpool.

AUDENSHAW.—For Building Vicarage for St. Stephen's Church. Mr. J. H. Burton, Architect, Warrington Street, Ashton-under-Lyne.

BELFAST.—July 9.—For Building School, North Queen Street. Mr. S. Hunter, Waring Street, Belfast.

BELFAST.—July 7.—For Building Residence at Holywood. Mr. T. McJohnston, Architect, 28 Waring Street, Belfast.

BURNLEY.—For Building Five Dwelling Houses. Mr. H. Smith, Architect, 3 Yorke Street, Burnley.

CUPAR, FIFE.—July 9.—For Enlargement of District Asylum. Messrs. Kinnear & Peddie, Architects, 3 South Charlotte Street, Edinburgh.

EAST ARDSLEY.—July 14.—For Building Mission Church. Mr. W. S. Barber, Architect, 9 George Street, Halifax.

FULWOOD.—July 11.—For Building Engine-sheds for the Local Board. Mr. T. Harrison Myres, 15 Chapel Street, Preston.

GREENWICH.—July 19.—For Building Pavilion and Additions to Union Infirmary. Mr. Thomas Dinwiddy, Architect, 12 Crooms Hill, Greenwich.

HALIFAX.—July 16.—For Building Shop. Mr. James Farrar, Architect, 29 Northgate, Halifax.

# IMPROVED FLAT BRICK FIRE-PROOF FLOORS.

No. 1.—Longitudinal Section.

No. 2.—Longitudinal Section.

**NO THRUST ON WALLS.**

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with specially moulded dovetail projections, forming a mechanical key to hold the plaster protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

**HOMAN & RODGERS,**

Engineers and Patentees,

17 GRACECHURCH ST., LONDON, E.C., & 13 DAWSON ST., MANCHESTER.

WORKS: RATCLIFF, LONDON, E., & HULME IRONWORKS, MANCHESTER.

Homan's Patent Girders, Rolled Joists, Cast-iron Columns, Roofs, Bridges, and every kind of Constructional Ironwork.

London Telephone, No. 1,026.

Manchester Telephone, No. 4,004B.

Registered Telegraphic Address—"HOMAN RODGERS, London."

"NAMOH, Manchester."

PONTARDAWE.—July 9.—For Building Baptist Chapel. Mr. G. T. Evans, Solicitor, Pontardawe.

PONTYPRIDD.—July 17.—For Rebuilding Tower of Eglwysilan Church. Mr. Vaughan, Architect, Cardiff.

RADCLIFFE.—July 9.—For Building Six Houses. Messrs. Sellers & Hamilton, Architects, Union Chambers, Bury.

RAMSBOTTOM.—For Additions to St. Joseph's Schools. Mr. C. W. Whittenburg, Architect, 74 King Street, Manchester.

SALFORD.—July 12.—For Building Stable, Engine-house, &c. Messrs. Darbyshire & Smith, Architects, 17 Brasenose Street, Manchester.

SHOTLEY BRIDGE.—July 13.—For Building Two Houses for the Co-operative Corn Mill Society. Messrs. John Smith & Son, Architects, Rose Cottage, Shotley Bridge.

SOUTHWICK.—July 12.—For Building St. Columba's Church. Mr. G. D. Irwin, Surveyor, Baltic Chambers, Sunderland.

## LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

## TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. &amp; R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

BANGOR: N. Wales: Sept. 14, 1885.

Considerably Reduced Price List, November 1, 1887.

## YORKSHIRE.

For Heating Borobridge Mansion, Yorkshire. Mr. J. MONK-  
MAN, Architect, York.  
JOHN GRUNDY, 30 Duncan Terrace, City Road, London, and  
Tyldesley (*accepted*).

## TRADE NOTES.

IN the notice of the opening of St. Patrick's Church, Widnes, erected from the designs of Messrs. J. & B. Sinnott, Liverpool, it was omitted to mention that the floors have been laid with Mr. Roger L. Lowe's (Farnworth) patent system of wood-block flooring.

THE swimming-baths at Hampstead, recently erected from the designs of Messrs. Spaulding & Auld, have been fitted throughout with lock and door furniture by Messrs. Edgar Keeling, Teale & Co., art metalworkers and ironmongers; the locks (over 200) for the dressing boxes and private baths were specially designed and made for this job. The whole of the gas-fittings, which are of a most suitable and substantial character, were also manufactured by Messrs. Keeling, Teale & Co.

TENDERS are being sought for a proposed new school in connection with the Independent Methodist Chapel, Lee Lane, Horwich. The designs are by Mr. T. E. Smith, architect, of Bolton.

THE new Sanatorium, Eastbourne, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates and Manchester stoves, supplied by Mr. E. H. Shorland, of Manchester and London.

THE Peterhead red granite and Aberdeen grey granite form a considerable item in the construction of the memorial clock tower at Brighton, and was supplied by Messrs. J. Whitehead & Sons, of the Granite Works, Aberdeen.

## A JUBILEE FOUNTAIN.

LAST year Sir William Marling, of Stanley Park, near Stroud, commissioned Messrs. Boulton & Sons, architectural sculptors, of Cheltenham and Kensington, to execute an ornamental fountain for the garden terrace in front of his drawing-room. The fountain has only just been completed and fixed up, in consequence of the difficulty to obtain a stone large enough for the centre bowl. The fountain is about 20 feet high and 15 feet diameter at the base; the whole is quatrefoil and square on plan, being richly moulded with carved capitals, foliage, lions' heads, arms, crests, mottoes, &c., and four richly-moulded and carved vases for flowers round the lower basin, the jets of water being arranged in a most artistic manner, and producing a very beautiful effect. The work has been carried out from the designs and under the instructions of the architect, Mr. J. P. Moore, of Gloucester, in a most satisfactory manner by the Messrs. Boulton; and also under the supervision of Sir William Marling, who has taken much interest in its details. The water supply to the mansion and fountain was also arranged by Mr. Moore, who made the plans of considerable alterations to Sir William's mansions both at Stanley and Ledbury Parks.

## DUBLIN CITY ARCHITECT.

At the meeting of the Dublin Corporation on Monday the re-election of Mr. Freeman, as city architect, was proposed by Sir G. Owens, and seconded by Mr. Toole.

Mr. Cummins moved as an amendment that the election be postponed pending a report ordered by the Council on April 27 being furnished by the city architect on the state of the baths in Tara Street. Mr. Carroll seconded the amendment.

Mr. Dawson said that the architect was not altogether to blame with regard to those baths, as the committee had had a great deal to do with the matter.

Alderman O'Leary said that until he got some information as to why the ratepayers were to lose 1,000*l.* a year by the

Handsomely bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

Barrack Street Labourers' Dwellings, he should oppose the re-election of Mr. Freeman.

The Town Clerk said that if the amendment were passed, there would be no city architect after to-morrow.

Mr. Cummins said he would alter his amendment to the effect that Mr. Freeman be elected for only one month, pending the presentation of the report ordered.

After some discussion, the amendment was put, and declared lost by a majority of 27 to 12.

A further amendment was moved by Mr. Pile to the effect that the election be postponed, and that a committee of the whole house be summoned to deal with the whole matter. Mr. Bonass seconded the amendment, which, after some discussion, was altered as follows:—"That Mr. Freeman be elected to the office for three months, and that all matters in reference to the works carried out by him be referred to a committee of the whole house for report on same." There were 17 for and 19 against. The amendment was therefore lost, and the original motion was adopted. After some discussion, Messrs. Walsh and Butler were re-elected building surveyors.

#### IMPROVEMENT OF THE LIVERPOOL DOCKS.

THE dimensions of shipping having been vastly increased since some of the Liverpool docks were constructed, the problem of finding accommodation for the vessels daily grows more difficult, especially when economy must be considered. Mr. G. F. Lyston, the engineer of the Dock Board, has devised a plan of pumping on a large scale, which it is anticipated will be effective. Indeed, in the Sandon Dock pumping has already been tried with unqualified success. Out of that dock, which has an area of about ten acres, there run six graving docks, all more or less obsolete on account of their shallowness. The difference in depth between the sills of the graving dock and the sills of the wet dock is, on the average, five feet. To have deepened them to that extent would not only have involved great cost, but it would have rendered them far less convenient in form and harder to pump dry. The alternative was to raise the level of water in the wet dock, so that when it became necessary to place a vessel in one of the graving docks she would have a sufficient depth of water to enter. This was done by means of pumping apparatus. The Dock Board erected at the Sandon Dock four centrifugal pumps, each of 36-inch

diameter suction, and these, pumping 22,000 gallons a minute a-piece, raise the water in the Sandon Dock 5 feet in the course of an hour and a half. This scheme was undertaken, in a measure, experimentally.

The south docks which it is now proposed to treat in the same way—that is to say, the Wapping Basin, Wapping, King's, Queen's, Coburg, and Brunswick Docks, and Queen's Dock Basin—have an area of 36 acres, and the idea is to supply them with water during neap tides to such an extent that, notwithstanding leakage, lockage, and the use of the half-tide docks, there will be retained a minimum depth of 22 feet. This is the mean depth at high water, for it must be remembered that the depth in the docks during spring and neap tides varies to the extent of 11 feet. The only entrance to and exit from these docks for large vessels will then be the deep-water approach already described as existing at the Herculanum entrances. The Herculanum has been constructed with two sets of gates, and between the new and older south docks there is now being completed a connecting dock or lock 500 feet in length and 120 feet in width, through which ships can be passed. The pumping will raise the water in the Brunswick and the others of the older docks several feet above the level in the new docks to the south, and vessels using the older docks will have to be collected at the docks an hour or two hours before high water, and to pass through so as to get into the river as soon as possible after the entrances of the Herculanum have been opened. Vessels of light draught, which do not require to take advantage of the extra depth, will still use the Queen's Half-tide, the Coburg, and the Brunswick Half-tide as direct exits to the river. Special arrangements have been made as to the traffic in the Coburg. An hour and a half before high-water it will be allowed to run down; at high water the gates will be closed and the pumps started.

To carry out the plan thus outlined there are being erected on the west pier-head of the Coburg Dock three large centrifugal pumps, with compound condensing engines and the necessary boiler-power. Each pump has a suction 54 inches in diameter, and will be capable of delivering 57,000 gallons per minute. Together they will pump 15½ million gallons through an average lift of 43 inches in 90 minutes. The pumps are expected to be in working at the end of the year, and by greatly increasing the capacity of a series of important docks will obviate great existing inconveniences. Should this system prove as easy in practice as it looks feasible in theory it will probably be extended to other docks at the north end, notably

to the Huskisson Dock, which, although a fine work, has become too shallow for the present class of vessels, also possibly to Birkenhead, where, under existing conditions, a want of sufficient water on neap tides is frequently experienced. If the docks mentioned above are used by larger vessels improvements in shed accommodation and quay space for storage must follow as a necessity, and these are in contemplation. The great advantage of this method is that not only does it avoid a great outlay for purposes of reconstruction, but it prevents the great loss of revenue which the closing of a dock for any length of time involves.

### THE SUPPORTING POWER OF SOILS.

BY RANDELL HUNT.

It is often necessary for the engineer to prescribe a limit of load per unit of surface in designing foundations for structures resting upon soil. In the absence of the time and means to make actual tests of the soil, he must confine himself to an investigation of existing successful structures upon a soil as nearly similar to the one under consideration as he can find. It is the object of this paper, then, to present a few remarks upon the actual supporting power of soils as deduced from an investigation of the matter from our own observations, and the recorded examples which have been accessible. It is probably possible to devise a general mathematical formula which would be applicable to the supporting power of any soil, but such an expression would necessitate our knowing so many particulars as to the character of the soil, such as its weight and natural slope, that we could judge of its actual strength fully as well without applying it. At any rate, we shall confine ourselves simply to the practical side of the matter.

*The Supporting Power of Clay.*—The supporting power of clay is very variable and depends in a large measure upon the variety, and upon its degree of saturation with moisture. In the roadbeds of railroads, when the "surfacing" has been done with clay, a smooth, hard bed, unyielding and with far greater supporting power than would be required is always found in dry weather. It becomes very compact, so much so that it is impossible to press the point of a walking-cane into it. But after a drenching rain all conditions change, and the roadbed becomes a mass of mud, into which the ties are pressed down and the clay bulges up between them. We mention this simple example of dry and wet clay because it is familiar to most of

us, and shows clearly the effect of too much moisture in such soil.

The clays vary considerably, however, in their chemical constituents, and are affected thereby in the degree to which they absorb moisture. Certain deposits are known to be compact and hard, with a high supporting power, while others are in the condition of a plastic material easily compressed. But its chief characteristic which renders all clay more or less unstable, when regarded in the light of a foundation, is its known property of retaining water once admitted to it and its softening propensities, which gradually take place as the amount of water increases.

The stiff blue clay deposits of London are celebrated as much for the numerous failures of the bridges and other structures founded on it as for any other reason. Old Westminster Bridge had probably about  $5\frac{1}{2}$  tons per square foot of foundation, and failed. Blackfriars Bridge had about 5 tons, and appeared to be stable for many years, but ultimately settled very badly. New London Bridge was built in 1831, and founded upon piles, upon which as much as 80 tons per pile was imposed. Of course it has settled, in some places as much as a foot. The pressure per square foot of the entire foundation of this bridge is 5 tons. When the new Westminster Bridge was built, the load per pile was reduced to about 12 tons, while the load per square foot of the entire foundation was reduced to 2 tons. I find no record of this bridge having shown any sign of settlement.

Robert Stephenson attempted to load a stiff, hard clay with 5 tons per square foot. He was building some high bridge piers at the time, but before they were completed serious settlements took place, and he decreased the amount per foot by making his foundation of greater area than first determined upon. He also built a large chimney, which failed, and then constructed another at Newcastle-on-Tyne, with only  $1\frac{1}{2}$  tons per square foot of foundation, which was successful. Both these chimneys are described as being founded on hard compact clay.

The subsoil of the vast valley of the Red River, North America, is a bed of clay, which varies in depth from 80 to 125 feet, a bed of sand and gravel usually being found underlying it. This clay is generally of a yellowish colour, and appears more or less hard and firm in proportion to the amount of moisture contained in it. Chemically considered, it has a large amount of carbonate of lime in it, as can be seen from its action when treated with acids, and when freshly opened up to view in a

place where free from much moisture appears about of the consistency of marl.

In 1881, at Fargo, Dak., a brick building of four storeys in height, including a basement storey, was constructed upon a concrete foundation. The pressure per square foot upon the clay was at no place greater than  $2\frac{1}{2}$  tons, and was probably even less than this amount. The building showed a certain amount of settlement each season, until the third year after being built one side of it suddenly commenced to crack, and settled a foot or more in a single day, becoming so dangerous that the occupants were compelled to abandon it. The side which had failed was immediately torn down, a new foundation of broader dimension put in, and the wall reconstructed. The load per square foot on the clay of the new wall is about  $1\frac{1}{2}$  tons, and, as far as the author knows, it has remained intact. All along the side of the wall which failed was an open area-way which was very imperfectly drained, which we are inclined to think was the cause of the clay becoming softer than it otherwise would have been; for the other three sides of the building, while showing more or less settlement, yet remained comparatively in good condition.

In the city of Cleveland, Ohio, many heavy structures have been founded upon clay deposits, and one or two notable ones have shown serious settlements. In the new central viaduct, now being constructed, and the foundations of which were described in the *Journal of the Association of Engineering Societies*, the pressure per square foot of foundation on those piers and abutments which rest directly upon the clay has been limited to from 1 to  $1\frac{1}{2}$  tons. The abutments which exert the largest load mentioned are described as resting upon "a mixture of blue sand and clay, with some water," while the piers giving a load of but 1 ton per square foot rest upon a "plastic blue clay of various degrees of stiffness mixed with fine sand."

When clay is mixed with other materials, as coarse sand and gravel, its supporting power usually largely increases, being greater in proportion as the other materials are in excess, up to the point of forming a concrete mass, in which the clay is the cementing material, and in just sufficient quantity to bind the materials together. In this condition we often find the clay in an indurated state, and the hardness of the mixture—commonly called "hard pan"—is proverbial. Such soils are safe for heavy loads, approximating that of the softer rocks.

Brennick, in his book on foundations, mentions a large chimney, with a load of 6 tons per square foot on hard clay.

This is an extraordinary example, and we are inclined to think, though no further particulars are stated, that it was upon some such hard mixture of clay and gravel as mentioned. At any rate it would be a bad precedent to follow in loading beds of pure clay.

The Washington Monument is founded upon a layer of clay and sand. When the shaft was up 150 feet, an investigation showed that the foundation was entirely inadequate upon which to complete the structure, a committee of United States army engineers reporting that such a soil should never be loaded above 10,000 lbs. per square foot. The foundation was therefore made heavier and larger, and the shaft successfully completed with a height of 555 feet. Colonel Casey, the engineer in charge, reports the pressures upon the soil as nowhere exceeding 9 tons per square foot, and less than 3 tons per square foot near the outer edges. The settlement of the monument during the repairs to the old foundations was about 2 inches, and afterwards a further settlement gradually occurred during construction of 2 inches more, making a total of 4 inches. If the load per square foot on the soil reaches the amount of 9 tons, it is the heaviest load upon such a soil which we find any record of, and we think the doubts expressed by different persons as to the ultimate stability of the monument entitled to careful consideration.

*Supporting Power of Sand.*—Foundations on coarse sand and gravel are usually successful, particularly if free from the action of running water, and structures, proportioned in accordance with any ordinary rules of good construction, are hardly likely to have an area of base which will not be sufficient to limit the load per unit to the safe carrying capacity of the soil. Coarse sand deposited in beds has usually a high supporting power, but the coarseness alone is not proof positive of this, for it also depends somewhat upon how it has been deposited. On beds of sand made artificially, as is often done for foundations, the dry sand loosely thrown down does not form a compact mass, such as is desirable, and a certain amount of compressibility will exist. In some experiments made in France with river sand, it was found that by pounding the sand in thin layers, its density could be increased one-fifth, and that there still remained about 20 per cent. of voids which could be notably reduced by simultaneously treating the sand with water, while the stamping down took place. The compression was exercised in these experiments by means of hydraulic presses, and the results obtained showed that river sand treated as above would resist up to pressures of 1,420 lbs. per square inch. Water is

SOLE PATENTEE OF THE SELF-ACTING

**SMOKE-CONSUMING AND REGENERATING FIRE LUMP BRIDGES,**

Specially cast to suit all kinds of Boilers.

At the above Exhibitions, Fourteen of W. NOBLE'S PATENT BRIDGES were used for the economising of fuel and the consuming of smoke, to the entire satisfaction of the Chief Engineer (A. CAREY, Esq.), and Surveyor to the Royal Commissioners (WILSON BENNISON Esq.).

the chief agent which makes the particles separate, and draws them into the voids of the mass, and is invaluable in all works of embankment in which solidity is required; but it must also be well drained off, because if the original amount should remain, of course the mass of earth would continue in a semi-fluid state.

Mr. Macdonald, in constructing the iron ocean pier at Coney Island, assumed that the safe load per square foot upon the flanges of the iron discs, which were sunk into the sand, was 5 tons. But many of them really support as much as 6.3 tons continually, and are subject to occasional loads of 8 tons per square foot, which they appear to sustain without settlement. The foundation of the large chimney of the New York Steam Company was made of concrete resting directly on the sand of the old beach, which had formerly extended to this point. This sand was quite fine, with pockets of gravel, and containing at a few places some stone. The sand was thoroughly saturated with water, and would flow when disturbed or undermined. The load per square foot on this material was to be 4 tons, but before more than one-third of this amount was placed upon it slight settlements occurred which were not uniform. After the structure was completed slight cracks appeared, but not sufficient to cause any material damage. In contrast with the loading of the partly unstable sand of this chimney, may be mentioned the loads which were imposed upon a clean, coarse sand in the foundations of the Pacific Mills chimney, at Lawrence, Mass. Here the sand was enclosed by tight sheet piling, and only 1.83 tons per square foot placed upon it. The anchorage of the Brooklyn Bridge rests upon sand, with a pressure of about 4 tons per square foot. The Nantes Bridge, constructed in 1863, and founded on sand, has a pressure of 6.78 tons per square foot, but has settled somewhat. The safe loading upon the sandy soil of Berlin is generally taken at about 2.3 tons. Brennick describes this sand as being comparatively loose, but likewise mentions its having been successfully loaded up to 4.1 tons per square foot.

When sand is mixed with other materials, such as clay or loam, which have the power of retaining water, its supporting power grows less, and proportionally more so as the sand becomes finer and loses its sharpness. Of such a nature is the commonly called "quick" sand, which really occupies a position between pure sand and pure clay, being a mixture of them both. Pure clay is composed of alumina, water, and silica, and in proportion as the silica is absent the more water will it hold. This is the material which, when mixed with the very fine and

rounded grains of sand, makes it "quick." Deposits of such are often found, which through long draining have lost all the water, and which appear dry and loose, and easy to excavate or handle, and generally of a whitish colour. If we could keep such deposits absolutely free from saturation with water, we could trust it with moderate loads. Its weight is less than either good sand or clay, running from 70 to 90 lbs. per cubic foot.

At the foundations of the Capitol at Albany, Mr. W. J. McAlpine describes some of the material as being quicksand without the water. Experiments made in the soil of this foundation showed that under a weight of 2 tons per foot no perceptible displacement occurred; and at about 5 tons the surrounding soil was forced upward. It was endeavoured to place no more than 2 tons per foot upon the soil with the completed building, and great pains were taken, by means of spreading gravel 6 inches deep over the whole area, and enclosing it in a puddled wall, to keep the character of the soil from changing. These foundations have partly failed, and serious cracks have appeared at different parts of the structure.

We find recorded by Debaue a case of founding upon a loose, watery sand, partaking somewhat of the nature of quicksand, in which the load per square foot was 1.8 tons. The sand is described as being of a syrupy consistency, and after endeavouring to excavate it without success, further than getting out about 3 feet in depth, they filled back into this partially excavated hole with dry, coarse sand, placed a bed of *béton* upon it, and completed the structure, which was a bridge over the canal of the Sambre à l'Oise, for the railroad from Busigny to Herson in France. No after settlement occurred. This method of treating quicksands with coarser sands and gravel appears to have been of much service in many cases. Trautwine records an example of its successful use in making a foundation over quicksand, for the brick aqueduct for supplying Boston with water.

*Supporting Power of Soft Soils.*—In speaking of soft soils we generally mean those which are referred to as being compressible, though really this is more or less of a misnomer, for they are regarded as being the more compressible in proportion to the amount of water they hold, and yet we know that water is practically incompressible. Debaue, in his excellent work on foundations makes this distinction clear, and classes such soils as *mobile*, movable, which in itself is a true definition of their characteristics. The alluvial mud of many rivers gives us the best examples of soils of this kind, and in this country, as in general in most others, the soft soils are usually found at

PATTERN BOOKS ON APPLICATION.

the lower end of rivers flowing through valleys of considerable width, and emptying into the sea or large lakes, where the force of their currents is checked by the larger body of water, causing the detritus held in suspension to be deposited in beds of greater or less thickness, or by overflowing their banks and spreading far and wide throughout the valley, the waters lose sufficient velocity to carry the suspended matter further. An example of the greatest magnitude of such formation is seen in the country adjacent to the lower Mississippi, and much of the State of Louisiana has been formed in this way. Here is to be found the *prairie tremblante*—or trembling prairie—vast stretches of land composed of semi-fluid mud subsoil, overlaid by a mass of decayed vegetable matter, which, tied together by rootlets, forms a more solid, but trembling, crust. It is impossible, of course, to solidly found anything upon such soil, but rather must any such attempt be regarded as a problem of flotation in a muddy liquid. Yet we are often called upon to construct railroads, bridges, and buildings in soil but a trifle more solid and homogeneous. The supporting power of all soils is of course dependent more or less upon the depth at which the foundation is made, and in the alluvial soils such as we are now considering, this is of more importance than in other kinds. We have not time at our disposal in this paper to enter into this matter more fully, and in our remarks we have treated upon the supporting power of soils as we generally use them, and not much affected by depth.

The softer clays really belong to and should be treated in the same manner as the soft alluvial soils to which we are now alluding. The actual supporting power of such soils can hardly be given in figures which can be of much real value. In the city of New Orleans, for instance, almost without exception, we find recorded the serious settlement of all the larger buildings and structures, which have been founded directly upon the alluvial soil, and in many cases the load per square foot is much less than a ton. From some experiments made in India in alluvial soil, the safe load per square foot is given as 1 ton; while Sir Charles Fox finds it to be only 1,680 lbs. for the soil which he tested.

Experiments to determine the weight which can be safely placed upon soft soils have often been made, but are not generally of much value, unless the area of soil tested is of about the same extent as the base of the foundation to be placed upon it. This was very clearly shown in France some years since by a series of experiments made in the soft alluvial soil of the valleys of Vilane and l'Oust. A number of small

piers of masonry, 6.56 feet square, were built at different points, and made of such a height as to give a load per square centimètre double that of the large embankment which it was the intention to afterwards construct. It was supposed that these piers would settle deep into the mud, but they really settled a comparatively small amount, while the embankment, covering a great, broad area of base, but exerting a pressure per square centimètre of only one-half that of the piers, showed in all cases very much greater settlements.

The explanation was simple: if a small pier with a square base, pressed down into the soft soil, the frictional resistance against the sides of the compressed ground is proportional to the length of these sides, while a square pier of, say, double the width, would experience a frictional resistance just twice that of the first pier. In other words, this resistance is directly proportionate to the length of the perimeters of the bases. But the area of the base of the second pier is four times that of the first; hence we see that, with an equal pressure per square unit of base, a small pier would have much more resistance to overcome than a large one, and that one would be at fault to take as a correct measurement of the supporting power of the soil the results obtained from loading but a limited area.

Stated then as a proposition, the supporting power of soft soils is greater in proportion as the loaded area is limited, or conversely; large areas of soft soil will not support as much weight, per unit of surface, as more limited areas of the same soil. This principle is most important and should not be neglected by engineers designing foundations. It is applicable to the supporting power of bearing piles, and hence any formula for the same which does not make a distinction due to different sectional areas of the piles is incorrect in theory.

#### PORTLAND CEMENT.

JOHN BAZLEY WHITE & BROTHERS, LIMITED, OF SWANSCOMBE, KENT, v. RIPLEY.

IN this action, in which the plaintiffs alleged that the defendant had refilled their sacks (marked with their trade mark) with cement other than theirs, injunction, with damages and costs, has been granted by the High Court of Justice against the defendant, perpetually restraining him from using or otherwise infringing the plaintiffs' registered trade mark for cements and plasters.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, Consulting Patent Agent, 43 Southamton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

## APPLICATIONS FOR PATENTS.

8782. William Fraser, for "Improvements for the better consuming of smoke and the better combustion of fuel." June 15, 1888.

8796. Gustave Charles Anthoni, for "A system of complete isolation of buildings and other constructions, machines, vehicles, and apparatuses of all kinds, with the object of deadening vibrations and shocks." June 15, 1888. (Complete specification.)

8825. Thomas Sandbrook, for "Improvements in valve seatings for cisterns." June 16, 1888.

8829. John Fraser Calder, for "Improvements in cisterns for water supply to water-closets and other appliances." June 16, 1888.

8831. Edwin Chatham, for "A new or improved apparatus for crushing and mixing mortar." June 16, 1888.

8832. George Henry Leane, for "Improvements in the method of constructing buildings and works in alluvial soils." June 16, 1888.

8877. Frederick Pilling, for "Improvements in roller-blind furniture." June 18, 1888.

8960. John King, for "Improvements in flushing cisterns or water-waste preventers." June 19, 1888.

9017. Thomas Ash and Richard Peacock, for "A window-fastener." June 20, 1888.

9054. William Peyton, "An improved chimney-head or pot." June 21, 1888.

9098. Andrew Smith, for "Improvements in Venetian blinds." June 21, 1888.

9104. Reginald Crooke, for "Improvements in the construction of drying stoves, particularly applicable for use in the manufacture of gunpowder." June 22, 1888.

9108. Doctor Craven, for "Improvements in shutters and sunshades, and appliances connected therewith." June 22, 1888.

9111. John Cumming, for "Improvement in surfaces for

printing, embossing, and ornamenting fabrics and papers, &c. June 22, 1888.

9112. Richard George Jones and John Henry Butterworth, for "An improved drawing and ruling pen." June 22, 1888.

9127. William Firth, for "Improvements in pit props, bars, or girders." June 22, 1888.

9138. Francis Joseph James Gibbons, for "Improvements in fanlight openers." June 22, 1888.

9163. Thomas William Twyford, for "Improvements in or additions to water-closets." June 23, 1888.

9179. Joseph Frederick Thompson, for "Improvements in locks, and in the means for operating the same." June 23, 1888.

9184. Emilie J. Tobin, for "An improved system of ventilating dwellings and other structures." June 23, 1888.

9208. Frederick Russell, for "An improved method of ornamenting glass." June 23, 1888.

9271. Alfred Coleby Emery and William Henry Taylor, for "An improved appliance for use when jointing pipes." (Complete specification.) June 25, 1888.

9274. Benjamin Lane, for "Improvements in or connected with window sashes." June 26, 1888.

9278. Thomas Feather, for "Improvements in the formation and construction of the jointing of pipes." (Complete specification.) June 26, 1888.

9317. Richard Joseph Stephens, for "Improvements in or relating to fastenings for casement windows and the like." June 26, 1888.

9377. Ralph Edwin James and Alfred Haley, for "Improvements in apparatus for heating water for bath or other purposes." June 27, 1888.

9388. Arthur Ramsden, for "Improvements in sewer and other pipe joints." June 27, 1888.

9403. William Thomas Symons and Lewist Prust Symons, for "Improvements in materials for floors or covering for floors and walls and other purposes." June 28, 1888.

9409. Josiah William Saunders, for "Improvements in sash fasteners." June 28, 1888.

9418. John James Mann, Reginald Arthur Smith, and Charles Mark Dorman, for "Improvements in portable pneumatic apparatus for dressing stone and other purposes." June 28, 1888.

9451. John Addy Hopkinson and Joseph Hopkinson, for "Improvements in stop-cocks." June 28, 1888.

9460. Charles James Grasmus Kinslow, for "An adjustable mulet gauge for carpenters and joiners." June 28, 1888.

## HARPER TWELVETREES'

### New System of Washing Machinery

For PUBLIC INSTITUTIONS, HOTELS, SCHOOLS, & MANSIONS,  
As used in Her Majesty's Laundry, Devonport Steam Laundry, Rangoon Steam Laundry,  
Suez Steam Laundry, Whitechapel Infirmary, Mont Dore Hotel (Bournemouth), &c., &c.

Is specially recommended to Architects as the most perfect and economical.

Plans and Specifications for completely furnishing Hand or Steam Laundries given to Architects and Engineers; together with Prospectus of Washing, Rinsing, Boiling, Wringing, Drying and Iron Machines, Hydro-Extractors, Drying Closets, Stoves, Engines, Boilers, and all Laundry requisites.

 6661. William Coulsell, for "A locking pin combination T and set square." May 4, 1888.  
 6892. William Crisp, for "Improvements in locks." May 9, 1888.  
 7223. George Smith, for "Improvements in sockets for earthenware pipes." May 15, 1888.  
 7638. William Snellgrove, for "Improvements in grips for blind and other cords." May 24, 1888.  
 7604. Walter Allan Bois, for "An improvement in door and like barrel bolts." May 23, 1888.  
 7781. John Charles Jeffrey Smith, for "Improved apparatus to be used in the manufacture of cement." May 28, 1888.  
 7811. William Orr and Peter Stuart Brown, for "Improvements in glazing." May 29, 1888.  
 7815. John Knight Champion, for "Lock bricks." May 29, 1888.  
 7878. George Andrew Hobson, for "Improved construction of metal floorings or roofings for bridges, &c." May 29, 1888.  
 7905. James Dougall and Thomas Davies Harries, for an "Improved artificial stone." May 30, 1888.  
 7925. Henry Thomas Holloway and Henry Holloway, for "Improvements in block floors or pavements." May 30, 1888.  
 7936. Louis Christophe, for "Improvements in making of roads, paths, or ways." May 30, 1888.  
 7976. William George Margetts, for "An improvement in the manufacture of Portland cement." May 31, 1888.  
 8043. James Harry Edwards, for "Improvements in the method of locking door latches."  
 8115. Alexander Sharp, for "Improvements in door handles." June 4, 1888.  
 4569. Joseph Sadler Garthwaite, for "Automatic cut off for gas-burners and gas-brackets." March 26, 1888.  
 6027. William Henry Harling, for "An improved method of holding needles on legs of drawing instruments." April 23, 1888.  
 7027. John Wareing Wolloms, for "Improvements in window fastenings." May 11, 1888.  
 7253. William Harte, for "Improved device for regulating window-blind and other cords."

7381. Giovanni Luigi, for "Improvements in window-blind rack pulleys." May 18, 1888.  
 7502. Arthur Henry Oakden and William Charles Sharpe, for "Improvements in paint burning off stoves." May 22, 1888.  
 7664. Henry Somerville Fearon, for "Improvements in the construction of fireproof floors." May 25, 1888.  
 7820. Thomas Robert Shelley, for "Glazing roofs and sides and other portions of railway stations, conservatories, billiard-rooms, and other structures." May 29, 1888.  
 8007. Archibald Dichmont, "A combined sliding sash and French windows." June 1, 1888.  
 8130. George Liscoe, for "An apparatus for mechanically separating solids from fluids of sewage." June 4, 1888.  
 8270. Charles Ellis, for "Improvements in Ventilators." June 6, 1888.  
 8313. Parlane Macfarlane Walker, for "Improvements in apparatus for securing the ventilation of rooms and buildings." June 7, 1888.  
 8364. Carl Weissshuhn, for "Improvements relating to the manufacture of wood pulp, and to apparatus for use in such manufacture." June 7, 1888.  
 8371. William Edwards, for "Improvements in the prevention of the pollution of rivers and watercourses from manufacturer's polluted water and waste, and for cleansing and purifying ordinary river waters for the use of manufacturers in their business, and for the recovery of expensive materials used in certain trades, as in paper mills, dye works, and others." June 7, 1888.  
 8391. James Craig, for "Improvements in flush-out water-closet basins." June 8, 1888.  
 8414. Felix Schenk, for "Improvements in hygienic desks, tables, and seats for use in schools and other places." June 8, 1888.  
 8521. James Coulter, for "Improvements in stone-dressing machinery." June 11, 1888.  
 8525. Frederick Lawrence Rawson and Philip Jolin, for "Improvements in electric trembling bells." June 11, 1888.  
 8562. John Osgerby and John Lea, for "Improvements in chimney tops." June 11, 1888.  
 8612. Matthew Cranswick Greenhill and Charles Longbottom Hindle, for "An improved clip or clamp for the use of artists and others." June 12, 1888.  
 8651. Theodore Schonheer Schoner, for "Improvements in locks." June 13, 1888.  
 8677. Henry Cullabine, for "Improvements in window-blind rollers and the method of securing the blinds thereto."

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

9 Victoria Chambers, Westminster, S.W.  
 SIR.—I have much pleasure in testifying to the efficiency of your patent warm-air fire-grate. It has been very successful, and given every satisfaction where I have used it.  
 Yours, &c., JAMES WEIR, F.R.S.B.A.,  
 6 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect,  
 28 Montagu Square, London, W.  
 Mr. Grundy, of Tyldesley, near Manchester, has carried out his plan of warming in several churches built under my direction, and in each case it answers remarkably well, and has given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
 September 1, 1887.  
 DEAR MR. GRUNDY.—I value your apparatus very highly indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
 Derry, September 16, 1887.  
 DEAR SIR.—I cannot refuse to give you a few words of commendation as to the apparatus you supplied for heating Derry Cathedral. Not only is the air of the Cathedral quite pure and pleasant to those attending the services, as it must be from the fact that most of the air heated is taken from the outside, but I find the building itself is so much benefited, as formerly it was damp and smelt damp, but now it is very dry and free from any musty smell. I find that, although the Cathedral is now much larger, the cost of firing is much less.  
 To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington, Cheltenham.  
 DEAR SIR.—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.  
 Mr. John Grundy.

Apply to JOHN GRUNDY, 30 Duncan Terrace,  
 City Road, London.

# THE FIRE AT THE GRAND THEATRE.

The destruction of this fine Building might have been PREVENTED by the USE of GRIFFITHS' "PYRODENE," which would have made the WHOLE of the SCENERY, STAGE, and its SURROUNDINGS—in fact, THE THEATRE in every part—ABSOLUTELY NON-INFLAMMABLE.

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

All Woodwork in new houses should be fireproofed. This liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

AND

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE.

NON-POISONOUS.

ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIR.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIR.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C., LONDON.

## BANFIELD'S IMPROVED PATENT INDICATOR,

For Closets, Lavatories, Bath-Rooms,  
Offices, &c.

Liberal Discount to the Trade.

PRICES.

Lacquered Brass, 4/6; Bronzed Brass, 4/9; Nickel-plated, 6/1;  
Japanned Iron Lock with Brass Indicator, 3/6.

This Lock supplies a want which has long been felt for a reliable and inexpensive means of showing when an apartment is engaged. By simply turning the handle, the door is locked and the word "Engaged" shown on the outside. Conversely, the act of unlocking withdraws the word from view. This Lock is a distinct improvement over all others; there are no wheels to clog, the working parts are covered, and it cannot fail to indicate accurately. It is very neat in appearance, the acme of simplicity, and the cheapest contrivance of the kind yet introduced. It can be easily attached to doors of any thickness, or either hand. A loose key can be supplied at a small extra cost for opening the lock from the outside, an advantage possessed by no other Indicator. The principle can be applied to existing locks, either mortice or rim.

To be obtained of the Patentee,

E. BANFIELD, BRIGHTON, Sussex, and of all Ironmongers.

NEARLY READY,  
VOLUME XXXIX. OF  
THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.  
OFFICE: 175 STRAND, W.C.

## COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may at any time within two months from the date of the official journal of the Patent Office, in which the acceptance of the complete specification was advertised give notice at the Patent Office in the prescribed form of such opposition.

10426. Thomas Moore, for "Improvements in lifters and fasteners for skylights, window sashes, trap doors, and the like." July 27, 1887.

11265. Henry Frederick Baugert, for "Improvements in flush bolts." August 18, 1887.

11324. Joseph Smith and Albert Roberts, for "Improvements in lavatories and in apparatus connected therewith." August 19, 1887.

11362. Henry Harris Lake, for "An improved parallel ruler." August 19, 1887.

12524. George James Snelus, William Whauvond, and Thomas Gibb, for "An improved preparation or manufacture of cements." September 15, 1887.

14536. Gustav Henry Block, for "Improvements in and connected with apparatus for the reproduction of writings, drawings, and other delineations." October 25, 1887.

8917. Thomas Seaville Truss, for "Improvements in cowl for chimneys and ventilating shafts." June 22, 1887.

9074. William Henry Leaver Cooper, for "Making, finishing, and drying plain or socketed stoneware sanitary pipes or tubes."

10511. William Norman Swettenham, for "Automatic flushing apparatus for water-closets." July 28, 1887.

11508. Richard Ridgway Harrison, for "Improvements in devices for opening, closing, and adjusting fanlights, sashes, and the like." August 14, 1887.

11624. John Alexander Hanna and Thomas Foulkes Shillington, for "Improvements in stoves." August 26, 1887.

13065. Edward Weldon, for "Improvements in the method of attaching the blades of saws to the handles." Sept. 27, 1887.

3001. William Johnson, for "Improved means of securing door-handles and latch followers to spindles." Feb. 28, 1888.

7747. George James Snelus, for "An improvement in the manufacture or preparation of cement." May 26, 1888.

7751. Hynek Breuer, Frank Skocdopole, and Paul Fundd, for "An improved window-sill." May 26, 1888.

7774. John George Dunn, for "Improvements in stays for casements, fanlights, and the like." May 28, 1888.

7792. Alfred Henry Ford, for "Improvements in sliding doors." May 28, 1888.

7858. Lorenz Bommer, for "Improvements in spring hinges." May 29, 1888.

## PATENTS SEALED, JUNE 29, 1888.

9504. Charles Douglas Norton, for "Improvements in window fasteners or catches." July 5, 1887.

2799. James Hird & John Alexander Ford, for "Improvements in and fittings connected with casement and sash windows, doors, and such like structures." Feb. 24, 1888.

3794. Sidney Jennings, for "Improvements in urinal basins." March 12, 1888.

5526. Felix Léon Edoux, for "Improvements in elevators or lifts." April 15, 1887.

7872. William Edward Rickard, for "An improved machine for felling trees." May 31, 1887.

8140. William Dunsmore Bohm, for "Improvements in the manufacture of stair treads, flooring, and other similar wearing surfaces." June 6, 1887.

8683. John William Kershaw, for "Improvements in and appertaining to door or gate handles or knobs, and to the fastening of the same." June 16, 1887.

8707. Henry Darby, for "Improvements in water-heating apparatus for domestic and other purposes." June 16, 1887.

9434. Joseph Easey, for "An improved automatic apparatus for dry-closets and water-closets."

10114. Irwin Clarke Wallas, for "Improvements in the heads of rain-water and other pipes."

596. Charles Browett, for "Preventing the rattling of windows, doors, and shutters." Jan. 14, 1888.

1885. Robert Sutcliffe, for "Improvements in apparatus for automatically unbolting doors." Feb. 8, 1888.

3555. Charles William Barron, for "Improvements in and connected with window sashes." March 8, 1888.

## ABRIDGMENTS OF SPECIFICATIONS TO JUNE 30, 1888.

"Fireproof-holders for joists for party walls." Cantle, J. A., 11438. An iron shoe or socket made so as to receive wooden joists, girders, or struts, so as to avoid their being built into party walls. Two slots are left in the lower part of the pro-

Note.—No Connection with the other BATH  
STONE FIRMS.

jecting shoe, so that the laths for plaster ceiling may be nailed through to joist.

*Claim.*—A fireproof holder for joists for party walls, constructed, as described and illustrated, substantially, and as set forth.

"Supplying and regulating heat to buildings, &c." Thompson, W. P. (for Johnson), 3438. This invention relates to automatic supply and regulation of heat to apartments or buildings by a system of apparatus in which electricity controls a fluid under pressure, and the fluid under pressure operates the controlling valves of the heating apparatus. This invention is entirely automatic, and requires no attention for long periods of time. To this end sources of power are made use of which are constant, and which are supplied without the attention of the occupants of the apartments of which the temperature is to be regulated. In order to render the system automatic, water is supplied from a city main, and delivered constantly under pressure as a power for compressing air, and the air thus compressed operates the valves of the heating appliance under the control of automatic electric devices.

"Door knobs." Boulton, A. J. (for Crawford), 6472. The shanks of the knobs are attached directly to the washer-plates instead of being fastened by set screws to the spindles, which in this invention are made to turn with the knob by the engagement of their square-sided ends with the singularly shaped cavities in the shanks and knobs. These shanks are secured to the washer-plates by means of a projection on the surface lying inside the recessed washer-plate.

*Claim.*—The above mode of attaching the shank of a door knob to the washer-plate on a door or lock by means of a groove or channel formed in or on the surface of the shank, which is encircled by the edge of the orifice of the washer-plate, and retained therein by the engagement of the sides of the groove or of flanges with the inner face of the recessed washer-plate.

10762. (1887) "Improvements in the arrangement of fireclay, terra-cotta, or firebrick domestic fireplaces." William Lewis, Old Cock Hotel, Halifax. The fire-brick backs and side lumps are built up in as large pieces as are convenient, and these are dovetailed together, or have grooves and rebates so as to prevent any piece sliding away from the adjoining brick.

*Claim.*—The method of constructing fireclay backs for fireplaces, in sections dovetailed or locked together by projecting bays, forming a component part of the sectional piece requiring

to be locked, substantially, as indicated in the accompanying drawings.

3785. (1888) "Improvements in water-heating apparatus." Joseph Winterflood, 346 Euston Road, London. Four double cylinders are placed one within another. (The outer cylinder being twice the depth of the inner ones and the innermost double cylinder being covered with a plate top and bottom to form a boiling chamber.) The space between each double cylinder (when they are placed one within the other) forming the outlet for the waste products of combustion. The tops of the cylinders are connected together with tubular stays, so as to form a continuous watercourse from the outer to the inner double cylinders. Beneath the whole of the cylinders I place a number of Bray's burners inserted to form the heating power.

11829. (1887) "An improved locking sash fastener." W. R. Crozier, 1 Leadenhall Street, E.C. This invention consists in forming lateral extensions upon the shank of the well-known knob or thumb-piece, which extensions enter a circular hole in the staple when the bar is pulled under the latter, and, being turned in the said hole, are prevented by the comparative narrowness of the slot, at which they are entered, from being withdrawn from the staple until they shall have been turned back to the relative positions which they occupied at the moment of entering.

*Claim.*—I.—The combination, in a sash fastener, of bar extension, and staple having a slotted hole adapted to receive said extension, substantially, as described and illustrated in accompanying drawings.

6791. (1888) "An improved device or bush for fixing trunnions of basins used in 'tip-up' lavatories, and for other sanitary purposes." G. H. Jennings and Sidney Jennings, sanitary engineers, Palace Wharf, Stangate, London. This invention is an improvement on Patent 4796 (1881), filed by Messrs. Jennings, and has for its object an improved device or bush for more securely fixing and strengthening the trunnions of tipping basins.

*Claim.*—The improved device or bush for fixing the trunnions of tipping basins used in lavatories, and for other sanitary purposes, substantially, as and for the purpose described and shown in the accompanying sheet of drawings.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialist in Building matters. Information free.—G. H. RAYNER, Patent Agent, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

ACCORDING to many amateurs and publishers, the greatest of the modern French engravers was ALPHONSE FRANÇOIS, who died a few days ago in his seventy-seventh year. He was most successful with plates after pictures by great painters, and he was equally competent in rendering styles that might be said to be opposed. Thus for the French Government he engraved FRA ANGELICO'S *Coronation of the Virgin* and the *Miracles of St. Dominic*, together with INGRES'S *St. Symphorien*, while not long since he produced a plate from one of DORÉ'S pictures for a London firm. The three painters were far apart in style as in time, yet M. FRANÇOIS suggests their characteristics as far as engraving will allow. He also was commissioned for plates after TITIAN, PAUL VERONESE, and CORREGGIO. He helped to make PAUL DELAROCHE popular by plates from that painter's French scenes. His *General Buonaparte* and *Marie Antoinette after her Condemnation* are masterpieces. M. FRANÇOIS was a pupil of M. HENRIQUEL-DUPONT, who still survives, and was a member of the Académie des Beaux-Arts.

THE Lord Chancellor of Ireland and the Lords Justices of the Irish Court of Appeal have given judgment on a point of law relating to arbitration. The contractors for the new Waterworks to supply the town of Ballymena, and the Town Commissioners did not agree, and in consequence the works were suspended. The contractors then commenced an action to obtain any moneys which were owing, as well as damages for breach of agreement. The Town Commissioners, who probably had not much faith in Irish juries, parried the attack by proposing that the dispute should be referred to Sir FREDERICK BRAMWELL, as was provided by one of the clauses in the contract deed. The Vice-Chancellor declined to sanction the arrangement or stay the proceedings, as the matter in dispute was not of the kind which was referable to arbitration. The Commissioners appealed, and are again defeated. The argument on behalf of the plaintiffs was that owing to the delay and neglect of the defendants, it was absolutely impossible to fulfil the conditions of the contract, and that in consequence the plaintiffs were entitled to revert to their original rights, as there was no question for arbitration. It is thus evident that the arbitration clause is considered as having only secondary importance, and is not to be taken as superseding the function of a court of equity.

A PAPER read by M. HOMOLLE before the French Society of Antiquaries reveals the name of a Greek sculptor who flourished about seven centuries before the Christian era—that is, IPHICARTIDES of NAXOS. It was found on the base of a monument at Delos of pyramidal form, of which a figure of APOLLO may have formed a part, for the feet are still visible.

It was stated by Mr. FORWOOD, M.P., on Tuesday, before the Parliamentary Committee on Town Holdings, that from his experience he believed that the houses on the leasehold land belonging to the Liverpool Corporation are superior in construction, sanitation, &c., to those erected on freehold land. At the same time Mr. FORWOOD acknowledged that the bulk of jerry-built houses in Liverpool will be found on leasehold ground. The Corporation property in Liverpool is of great value, for after excluding what is held by tenants at will (which is worth 18,000*l.* a year) and the markets, the assessable value is 656,000*l.* Most of it is held on seventy-five years leases, and, according to Mr. FORWOOD, there is no great desire among the tenants for enfranchisement. There are about 5,000 leaseholders. For the best property it is common to seek renewal of leases on the Corporation terms, but low-class property of the value of 2,000*l.* a year has fallen into the hands of the Corporation. The payments from the property are added to the city fund, and it appears that many of the finest buildings in Liverpool were erected from that fund without any need to levy a rate. Mr. FORWOOD advised that the

Corporation should have power to sell the reversions of leases, as under present conditions there was no interest on the part of the leaseholder to purchase the reversions, because he got the renewal on such favourable terms that it was better to renew than to purchase the reversions; but it would be a great mistake to compel the Corporation to sell their leaseholds, for it would practically be making a present of them to the leaseholders. Although the by-laws are stringent and are carried out, they do not produce such good buildings as are obtained under the covenants of the Corporation leases.

It is now arranged that the first plate produced by the new Société des Graveurs au Burin in Paris will be from the *Three Graces* by RAPHAEL, which belongs to the Duc d'AUMALE. M. DIDIER, the president of the society, has undertaken the work. The fashion for etchings, which is now almost universal, has caused engraving *au burin* to be much neglected. Just as line engraving is a lost art in England, it is feared that the art will also decline in France. To prevent that calamity the new society was founded. It consists of two hundred amateurs who pay a thousand francs a year. In return each member will receive an impression of the plates, which are to be produced at the rate of one plate a year. When the limited number of impressions are taken the plate will be destroyed. Subscription to the society is therefore not only a patronage of art but it is a speculation of a profitable kind, for the engravings are sure to increase in value as time runs on.

THE programme of the meeting of the British Archæological Association, next month, in Glasgow, is sufficiently interesting to justify the innovation of crossing the Border. The arrangements will be in charge of the local Archæological Society, in which Mr. JOHN HONEYMAN is one of the prime movers. The Marquis of BUTE has undertaken to preside, and, apart from the prestige which, through his Lordship's position, will be imparted to the proceedings among a people like the Scotch, it is well known that the Marquis of BUTE has studied archæology in a comprehensive sense, and will therefore be able to give aid in the discussions. In Glasgow there is much to be seen which is of importance. A day may well be spent in the cathedral, which would be considered most interesting in all parts if the stained glass could be covered. The collection in the temporary museum of the exhibition would alone be worth a journey to Glasgow, but we hope the crowds will be excluded while the members are in the "Bishop's Castle." The Isle of Bute will be visited, and no doubt the new residence of the Marquis of BUTE will be visible. At present, care is taken to conceal Dr. ANDERSON'S building. Rothesay Castle is well conserved. It is needless to say the Bute district is most picturesque. There will be also excursions to the Roman wall and Linlithgow, Bothwell Castle and Paisley Abbey, Craignethan and Lanark, the Torwood Broch, Bannockburn and Stirling, Dunblane Cathedral, Doune Castle, and the Roman camp at Ardoch.

ASMODÉE, that most disinterested Diable Boiteux, in order to reveal to CLEOPHAS what passed in Madrid, was obliged to remove the roofs of the houses. He waved his right arm, and presto! they all disappeared. An inventor in Brighton, named FARR, has devised and patented a different way of obtaining that sort of knowledge. His "Farrscope" is described in legal phraseology as an appliance for buildings or structures for enabling the interior of rooms or compartments to be observed from another room, compartment, or place exterior to such rooms or compartments. The revelations are brought about by the aid of tubes and revolving mirrors. The invention is enough to terrify, if not to reform, the world. Supposing, for example, the taxpayers of England could unobserved observe what is being done in any one of the Government offices, and how officials amuse themselves at an enormous expense to the country! What blue-book would be so convincing about the need of Civil Service reform as one glance in the "Farrscope"? There are many other cases where the invention will also be exceedingly inconvenient. It may be of some use in diminishing the cost of superintendence in large workshops.

## THE ITALIAN EXHIBITION.

THE collection of pictures at the Italian Exhibition is more numerous than any hitherto seen out of Italy. In 1857, when there was the fellowship of a common interest between the French and Italians, no more than fifty paintings could be found on the walls of the International Exhibition of Paris, and small as was the number, it comprised works by Italians who were living abroad, and works by artists who were simply residents in some Italian city. Sir FREDERICK LEIGHTON, for instance, was classed among the few Roman painters (his picture being *The Reconciliation of the Capulets and Montagues*), although a native of Scarborough and the pupil of a German. The scarcity of Italian paintings in the London Exhibition of 1862 was no less suggestive of the decline of art. At the Italian Exhibition in West Kensington there are about ten hundred paintings and drawings, exclusive of those which are to be found in the industrial department. They are not all, it is true, works of the highest class, and there are as many degrees of merit among them as can be seen in an exhibition of English pictures, but the humblest is not without interest, if it were only to know what kind of thing is the Italian "pot-boiler."

Two of the galleries show works which are lent, the Italian Government contributing most of the pictures in one room, while the pictures in the second room belong to Colonel J. T. NORTH. The King of ITALY has sent a couple of works out of the Royal Gallery. Nearly all the remainder are pictures which await owners, and as they were painted in order to captivate Italian patrons, they are not to be judged as if they were intended to be seen in Burlington House. It must not, however, be supposed that the collection contains pictures on which modest eyes cannot gaze with pleasure, or which will shock decorum. Far more nudities are now to be seen in the Royal Academy, and there is a general absence of that dallying with vicious scenes which is common enough abroad. Evidently there has been a vigorous weeding, and whatever may be the defects of the pictures, the majority will bear explanation to children.

It is always unsafe to speak of pictures as a whole, but in this case there are characteristics which may be considered as general. In the first place, the colour will be considered as over-glaring; but it should be remembered that they were painted to be in keeping with things which are very bright. The old Italians were not afraid of colour, and did not care to anticipate time in subduing and transforming it; and although some artists have a preference for French greys and browns, as yet the national taste has not gone in that direction. The state of the relations between France and Italy may prove an obstacle to a general adoption of the French system. The colours are not only of the brightest, but in order to produce effect they are very often laid on with an *impasto* that is not to be judged by the canons of English art. As a rule, the method is successful with those who employ it, and it is preferable to the thin painting of some canvases, which at first sight would appear to be the work of Germans.

As regards choice of subject, there is a lack of inspiration. In landscape there is a close adherence to nature, and no great variety in the selection. A large percentage of the pictures will be found to be illustrations of Venice. In figure subjects, some fields which formerly were most productive are neglected. There are pictures of church subjects, but not one could have been painted for the walls of a church or chapel. Mythology is left to the sculptors. A *Galatea*, which was inspired by RAPHAEL's picture, looks out of place amidst scenes of prosaic life. ORPHEUS appears as a shabby old fellow playing a flageolet for the entertainment of his cat and dog. When we see a *Bacchante* it is evidently a portrait of a model. Indeed, one artist who shows a boy in classic nudeness, and with a classic brownness of skin, recognises the altered state of affairs by describing it as a portrait, and revealing the name of the subject. Admirers of some of M. GERVEX's nude countesses, which appear from time to time in the Salon, would desire equal frankness. It is evidently felt in Italy, as elsewhere, that there is no use in attempting subjects from ancient Greek or Roman life, unless one makes a sort of systematic study of archæology. In the *Funeral*, by

G. ARIANI we see the result of that kind of preparation, and, although the ancient mourners appear to go through their duty in a perfunctory manner, the picture may be none the less true on that account. The black robes and the black bull, which is about to be sacrificed, stand out strongly against the red walls of the temple. It is the one picture which exemplifies the new spirit. *Virginia at her Bath*, which is near it, is only classic in title. In the room containing Professor SCIUTI's works there are several pictures of ancient historical subjects in an academic style, but from the size of the canvases accuracy of detail is not to be expected. Historical scenes of a later time are not in much favour, and French precedents appear to be followed. Such pictures as *A Game of Chess* between the Italian and Spanish champions in the time of PHILIP II., or *Richelieu at Court*, might easily pass for French works from the manner of treatment.

It is also remarkable how few pictures are inspired by incidents in the lives of great Italians who were not princes, warriors, or statesmen. The noblest of all the pictures in the Exhibition reveals what can be done if artists and patrons were less indifferent. It is one of the ways in which the Italians do not imitate the French, for it would be impossible to have a thousand French pictures (unless precautions were taken in the selection) which would be equally barren in representations of great artists and great writers. The picture we have just mentioned is F. JACOVACCI's *Vittoria Colonna and Michel Angelo*. It represents the last visit of the artist to the room where lies the corpse of the lady who was admired by him at a respectful distance as the *sedes sapientie*. MICHEL ANGELO's companion draws him from a scene which was becoming painful. The figures are all life-size, and by a master hand. VITTORIA is robed in white stuff, resembling satin in texture; and as the contrast between it and the white face might appear too marked, a lace collar, also of white, is introduced as an intermediary. There is no straining after effect; the pathos depends upon the situation. It is a pity a second picture by the artist was not obtainable for the Exhibition. The *Giordano Bruno*, by C. F. BISCARRA, can hardly be called a success. The attempt of one monk to obtain a retraction from another is not novel, and in this case we find no new features. The unfortunate pantheist wears the habit of the Order to which he once belonged, but as he became a civilian he would hardly be allowed to reappear as a monk. Italian artists give little heed to questions of costume. Then, again, the head appears to be a portrait of somebody now living who has not the aspect of a philosopher. A comparison of this head with one of SAVONAROLA in terra-cotta, belonging to Sir FREDERICK LEIGHTON, will suggest the difference between the creative and the mechanical methods of realising the past. Another picture which deserves recognition as having a subject connected with an artist's life is E. ERULI's *Pergolese at the Funeral of the Princess Spinelli*. The young composer (he died in his twenty-sixth year) is represented kneeling in the church before the corpse of the princess, and the whole of the funeral party stand still in order not to disturb his inspiration. The evidence for the incident is not trustworthy, and the picture is arranged in a way that suggests a scene in an opera rather than a religious ceremony.

It is among pictures of everyday life and commonplace incidents that the Italian artists are most successful. A study of the heads in terra-cotta and bronze of street arabs, beggars and old women, will convince any one about the realistic power which is in Italy. Some of the heads are not only representative of the lower classes, but they seem to be formed out of the mud of streets, in order to be more suggestive. Portraiture of that kind is not without trickery, but it suits artists who are only partially taught and cannot expect to receive large sums for their works. Ugliness is easily rendered, and it must be admitted that the cleverest pictures in the Exhibition are those which have some relationship to the new form of sculpture. Classicism and tyranny, we suppose, are associated in the minds of Italian artists, and one of the results of national independence is seen in the reaction against any treatment of form which was sanctioned by ancient canons. But the realism on canvas is not so remarkable as the realism of the sculpture, which might be said to be perfect if that term can be considered as applic-

able. The realism in painting and sculpture become more remarkable from being the work of Italians. There must have been much research exercised before the heads in the *Good Joke* or the *Soup Kitchen* could be observed, for Italian beggars, as a rule, are better looking than they are here represented. In fact, there is a superabundance of pictures of old people.

If we follow the order of the catalogue, the first picture which is met with is C. STRATTA's *Poor Man's Carnival*. It is a painting of a part of a crowd, who are assembled around the stand of a charlatan. The figures of the masqueraders are life-size, and are painted with much force. Like so many other works in the Exhibition, it is evident that most of the figures are portraits. This work has a wall to itself. In Room E (Turin) the *Segretario Galante*, by D. COSOLA, is one of several pictures which have the life of an Italian soldier for subject, and the Bersaglieri seem to secure a monopoly of attention, like the Zouaves formerly with French artists. In this case a soldier is writing a letter for a comrade in a field where tents are set up. *Punishment* is one of the church scenes, and shows a sacristan pulling a boy's ear for allowing a thurible to fall. His cries are loud enough to attract the attention of a woman who is kneeling at confession. It is the kind of picture that would serve for reproduction as a German lithograph. C. TURLETTI's *On the Track* is an old monk about to proceed on a begging excursion, but it is entirely free from any touch of caricature. Another pleasing work, by the same artist, is *Christmas in the Cloister*, where several children are seen entranced by a simple sort of representation of the Nativity. *New Times and Old Times* is not a well chosen title for a painting in which several figures in eighteenth-century costume are represented near one of the Venetian canals. The *Boys playing Truant*, by G. FALCHETTI, is a scene by the river side—some boys are teasing geese, and others are around a donkey, who seems to enjoy his share in the sport. The figures are mostly nude, and show careful study of the model. G. TESIO's *Cupid* is a boy of fifteen, well modelled, with wings of white feathers which are finely painted, although they offer too strong a contrast with the flesh. In this picture CUPID wears a jewelled band around one of his legs. There is a fine sombre landscape by SILVIO ALLASON in this room. Room D is also assigned to Turin. *Forbidden Fruit*, by G. GIANI, is a scene in a café thoroughly French in style. G. GROSSO's *Grand Canal, Venice*, is spoiled by the appearance of a black hulk which occupies a great part of the foreground. Although it may aid to bring out the distant parts, it is an eyesore in a picture which otherwise shows skill. *Primavera*, by G. CAVALLA, shows a couple of rather vulgar women in light dresses, buying flowers. A. LUXORO's *Genoa* is more a view of a suburb of the city, and hardly justifies the title. The *Cappella Reale, Turin*, by G. CANOSA, is, like all the representations of architecture in the Exhibition, an example of careful work. The dark walls offer a strong contrast to the white statuary. C. BISCARRA's *Entering Italy by the Valley of the Susa* is one of those landscapes which clash with ideas about the appearance of Italy which are formed before visiting the country. The *Halt of Bersaglieri*, by M. CALDERMI, is a scene in one of the streets of Turin.

In Room F there are several works which denote the versatility of Signor BAUDUC CERRUTI. Some are Arab scenes, but there is that stiffness about the horses which is not uncommon in paintings of the animal by Italians. The four sketches by G. LAVINIO, from buildings in Venice, are excellent, and he has a fine view of the Grand Canal. The *Church of Marcheta*, by G. CANOVA, is also deserving of attention. *Declamation*, by G. BARBAGLIA, depicts a young abbate reading from a manuscript before a lady who is seated. It is vigorously painted throughout. In this room will be found one of the few pictures that can be called religious, viz., *Golgotha*, by L. RAYMOND. The subject is the removal of the cross at night and it is treated with due reverence.

In Room I is E. FERRONI's picture, *Before the Squall*, a peasant woman tying her shoe in readiness for her journey. It is dark in colour, but figures and landscape are admirable, and there is as little posing in this picture as in one of MILLET'S. It is the only example by the artist in the Exhibition. G. RAGGIO's *Buffaloes of the Roman*

*Campagna* would pass for one of JULES DIDIER'S works. Room G has one finely finished work in M. BOUVIER'S *Philemon and Baucis*. On the opposite side is the best of all the portraits, *Walter Severn, Esq.*, by BARZAGHI CATTANEO, who is no less successful in portraiture than in fresco. He is now living in London, and his portrait of the President of the Dudley Gallery is almost enough to insure his success. M. MAGISTRETTI's two old priests in the stalls of a church is full of character, but the silver candlesticks on the altar are so like reality as to secure most attention. L. STEFFANI in *On the Lagoon* has found a good subject, a number of boys bathing, some being about to dive from one of the long posts. In Room H the most attractive work is *The Wave*, by M. POMPEO, which denotes a good eye for nature. G. INDUNO, in *A Flitting*, paints a removal from one of the upper floors of a house, the pictures and furniture being let down by ropes. M. BIANCHI'S *Margherita* will not please students of GOETHE. In R. TANCREDI'S *Julius II. after the Battle of Mirandola*, we see the belligerent pontiff marching at the head of his troops across the snow, and exciting varied emotions in the minds of the women and children who appear in the foreground, as the Pope seems almost to rise out of the ground. It would appear as if the painter was inspired by INGHERAMI'S comparison of JULIUS to NEPTUNE, who had only to show his head above the billows when their fury was calmed. The battle of Mirandola was fought in the winter, but JULIUS was too old to march, and had to be carried after the victory into the town. F. BERSINI'S *Reading* would be more satisfactory if painted to one-tenth the scale. An immense canvas is not needed to exhibit a monk reading at a fire (his back to the spectators) in a cottage. Room T contains several interesting works. The brilliancy of colour which is found in a Venetian fête is suggested by E. LANCEVOLTO'S *Regatta*. Colour is also strongly marked in the *Rocca di Papa*, a night scene with a balloon ascent. The *Lacrimæ Rerum*, by N. ATTANASIO, is a scene from a lunatic asylum, with five girls in white who use rosaries for other purposes besides praying.

The modern Italian school is of so recent a date, we must not be surprised if we see the consequences of many influences in the works. It is often said that imitation of the French is predominant, but the Exhibition hardly bears out that theory. From the variety of styles, the Italian painters might be said to come nearer the English. But while in England there is much striving after originality, the Italians, it must be said, are satisfied with whatever is nearest to them. There is much cleverness in Italy, by which work of a fairly good kind can be accomplished without much difficulty—and, indeed, what is genial in art is often the best—but works which need long and painful toil seem to be beyond the resources of the painters.

#### THE NATIONAL GALLERY.

THE report of the Director of the National Gallery states that the pictures purchased during the year 1887 were:—*The Holy Family*, by Marcello Venusti; *The Blood of the Redeemer*, by Giovanni Bellini; *A Muse inspiring a Court Poet* (?), by Dosso Dossi; *Portrait of a Girl*, by Domenico del Ghirlandajo; *Portrait of a Man*, by Sir Antonio Mor; and *Portrait of a Man*, by Heinrich Aldegrever.

The bequests and donations to the Gallery were:—*A distinguished Member of the Humane Society*, by Sir Edwin Landseer, R.A.; *Portrait of Sir Samuel Romilly*, by Sir Thomas Lawrence, P.R.A.; *Titania and Bottom* ("Midsummer Night's Dream, act vi., scene i."), by Henry Fuseli, R.A.; *The Virgin and Child*, by Luis de Morales; and three works by John Constable, viz.: *View of the House in which the Artist was Born*; *The Salt Box, Hampstead Heath*; *View on Hampstead Heath*; and the palette used by him.

The Director, in describing the rearrangement of the collection, says that the central staircase and five new rooms lately added to the National Gallery, and described in the last annual report, having been completed, so far as the builders' contract was concerned, in February 1887, were handed over for decorative painting to Messrs. Crace & Son, the firm employed by H.M. Office of Works for that purpose. The commission was executed with great promptitude, and by April 1 most of the rooms were ready to receive their contents. Meanwhile a scheme had been prepared for the rearrangement of the pictures. The desirability of classifying them under the several schools of painting to which they belong had been

apparent in the earliest development of the Gallery, and from time to time various efforts had been made to attain that object, but the rapid growth of the collection and the limited size of the building erected to accommodate it, notwithstanding repeated alterations and enlargement, greatly impeded those efforts, and rendered a consistently generic assortment of the works in question almost impossible. The recent addition of five new rooms afforded an opportunity, the first in the history of the Gallery, for attempting a more complete and systematic subdivision of the pictures, but though the present arrangement may be regarded as a step in the right direction, it has not been effected without compromise, and can hardly be regarded as final. More than one room even now may be called overcrowded. The influx of fresh acquisitions, for which space must be found, may at any time interrupt and disorganise the classification just adopted, and the prospect of such a contingency induces the trustees and Director again to urge upon H.M. Government the advisability of supplementing the work of the late Ministry by a further extension of the building. Between April 1 and May 31 the five new rooms and a vestibule on the eastern side of the central staircase were hung with pictures, while the contents of thirteen rooms in the older portions of the buildings were either wholly or partially rearranged, all the apartments having been renumbered as nearly as practicable in consecutive order.

The trustees and Director have renewed their application to the Lords Commissioners of Her Majesty's Treasury, urging their lordships to reconsider the question of restoring, either wholly or in part, the annual Parliamentary grant to the National Gallery for the purchase of pictures (suspended since 1885), and suggesting that at least the yearly sum paid by the public for admission on students' days (which may be estimated at 1,200*l.*), as well as the profits derived from the sale of catalogues, might be placed at the disposal of the trustees for the purpose above mentioned. Although their lordships were unable to accede to this request, they undertook to sanction an advance of 2,000*l.* from the Civil Contingencies Fund, for the purchase of pictures in 1887-88, should an opportunity occur of expending that sum with advantage to the Gallery. Their lordships have been also pleased to sanction the reinsertion of 100*l.* under Sub-head B in the National Gallery estimates for 1888-89 to cover the expense of the Director's official journey on the Continent, in the event of its being necessary for the inspection of pictures offered for sale.

During the year 1887 eighty pictures have been covered with glass, making a total number of 1,048 pictures so protected.

As nearly as can be calculated the National Gallery was visited by 787,522 persons on the public days during the year, showing a daily average attendance on such days (207 in number) of 3,804. On students' days (Thursdays and Fridays), when the number of visitors entering by payment is registered by a turnstile, 43,664 persons were admitted between January 1 and December 31, 1887; the admission fees (at sixpence each) amounting to 1,091*l.* 7*s.*, as compared with 1,198*l.* 7*s.* received in 1886. The total number of students' attendances at the Gallery on Thursdays and Fridays throughout the year was 26,649. Independently of partial studies, 523 oil-colour copies of pictures have been made, viz. 301 from the works of forty-eight Old Masters, and 222 from the works of twenty modern painters.

#### THE SCOTTISH SOLICITORS' LIBRARY COMPETITION.

THE Council of the Society of Solicitors before the Supreme Courts, after considering the reports and information received from professional gentlemen consulted, have unanimously resolved, says the *Scotsman*, that in their opinion the plan bearing the motto "Wisdom, Health, and Beauty" is entitled to the first place in the competition, and that the plans bearing the mottoes "Scottish Seventeenth Century" and "S.S.C." are entitled, the former to the first and the latter to the second premium. The author of the plan "Wisdom, Health, and Beauty" is Mr. James B. Dunn, architect, 116 George Street, Edinburgh, who, it may be remembered, was the author of the second premiated design for the Public Library buildings. The second design is by Messrs. M'Arthy and Watson, 137 George Street, and the third is by Mr. G. Washington Browne.

The new library buildings, designed by Mr. Dunn, will occupy a site immediately to the east of the Sheriff Court buildings, with a frontage to the Cowgate of nearly 150 feet. The treatment adopted by the architect as best in keeping with the surroundings is a free adaptation of the Scottish Baronial with Tudor features. In accordance with the memorandum issued by the Society, the architect has placed the library, reading-room, and stores in the topmost and second topmost storey of the building, and it is in his designing of these that he has found room for ornate treatment. The first four storeys of the building, which

are designed as artisans' dwellings, are quite plain. The upper part of the elevation to the Cowgate shows a centre portion with lower side wings—the main building, which contains the library proper, rising to a height of 90 feet above the street. It depends for effect partly on the large bays or oriels, which help to light the library, and the two side wings, and partly in the numerous ornamental chimneys, which, owing to the nature of the dwellings beneath, are a feature in the elevation. The windows have been corbelled out from the wall to a distance of 4 feet, and the chimneys have been treated with similar projections. The western corner of the building, which will be partially seen from George IV. Bridge, is finished off with a small hexagonal tower corbelled out from the wall as in the case of the windows. As to the interior arrangements, the principal rooms will be in the topmost flat. These consist of a reading-room, the library, and a hall capable of accommodating 200 persons. The access is from Parliament House, and the entrance is in the west corner of the building into a large vestibule, facing which on entering, and occupying the western wing of the building, is the reading-room, measuring 26 feet by 30 feet. To the east of the reading-room, occupying the main part of the building, is the library, a large and effective room, measuring 67 feet by 38. It is divided into five bays on either side; and the bookcase blocks, instead of being furniture merely, are treated as part of the architectural design, each block being terminated by a wide pilaster towards the room, these being connected by a series of elliptical arches springing from boldly designed trusses. The room is lighted from the four sides, this being attained by the side wings being kept low. Abundance of light is also obtained from the large cove in the ceiling of the room; and, with regard to the roof-lights, the architect proposes a series of double windows—an outer and an inner—the inner of tinted glass, so as to temper the lighting and prevent draughts. At the east end of the library are the lavatories and the librarian's room, communicating by a spiral stair with the book-stores in the flat below. In the eastern wing is the hall, entered from the vestibule by a separate corridor. A stair from the vestibule leads to the flat below, where there are four consulting-rooms, provision for heating, and book-stores, which, with the library, will accommodate 70,000 volumes. A fireproof floor separates this flat from the model dwellings beneath. These are designed for kitchen, room, and two bed coves, and each has its own sanitary arrangements. Special care, indeed, has been bestowed on the sanitary arrangements of the building, the system adopted being known as the "sectional" system, the drainage from the library portion of the building being entirely separated from that of the tenements beneath so as to decrease the number of ventilating pipes. Similar care has been shown in the treatment of the ventilating arrangements. A ventilating shaft runs the entire length of the library premises, and the vitiated air will be extracted by a Boyle's air-pump ventilator. At night Strode's ventilating sunlights have been proposed as a help to extracting the vitiated air. The estimated cost of the design is stated to be 13,000*l.*

#### THE CHURCH HOUSE.

ON Saturday a meeting of the general committee of the Church House was held in the rooms of the National Society, Broad Sanctuary, Westminster, for the purpose of receiving the final report of the executive committee. The Archbishop of Canterbury presided.

The Archbishop of Canterbury stated that their gathering represented the last meeting of a committee which had met but once before. The executive committee, which had been entrusted with full powers, had spared no labour necessary, and the general committee was now asked to receive the report. It was hoped that a fortnight later the Church House would be launched and would fulfil all expectations, in being a perpetually growing institution of perpetually increasing usefulness.

The Rev. R. M. Blakiston then read the report of the executive committee, which stated that the two sub-committees—one of sites and works and the other of finance—had been appointed, with the Duke of Westminster as chairman of the former, and the Bishop of London of the latter. A site had been chosen on the south side of Dean's Yard, comprising all the houses on the terrace, except Nos. 6, 7, and 8 (the acquisition of which was still under consideration), with all the land behind bounded by Tufton Street, Little Smith Street, and Great Smith Street. The right of purchase of the freehold of this site for the sum of 26,500*l.* had been secured. The property was held on long leases in five separate holdings. Negotiations for the purchase of the leasehold interest of some of this property had been entered into, and in some cases completed; while immediate possession of No. 10 Dean's Yard had been obtained, and a similar arrangement concerning No. 11 was on the point of completion. For the perpetual holding and management of the property the executive committee had presented a petition

for a charter of incorporation, and this had been granted on February 23, 1888. The receipts up to June 30 amounted to 45,853*l.*, while a balance of 2,681*l.* remained at the bankers, besides investments and deposits to the sum of 35,868*l.* The total liabilities incurred, and to be incurred, in purchase of the site amounted to 42,431*l.*, of which 3,146*l.* had already been discharged. The present resources of the corporation were amply sufficient to provide for these commitments. On the completion of the purchases the rents to be received would amount to 963*l.* per annum.

The Bishop of London, in moving the adoption of the report, said that he thought it would be well for the corporation to put themselves in entire legal possession of the freehold of the selected site and also of certain parts of the leasehold interest as soon as possible. There was one house which they were about to occupy immediately, and in which some of the most important committees of the Lambeth Conference would find accommodation. The site was convenient, and the conditions of obtaining it were also especially advantageous. What was now required was that persons all over England interested in the Church should become members of the corporation and each pay the guinea annual subscription.

Lord Stanhope, in seconding the adoption of the report, said that the charter having been obtained, the next consideration was that of building, and he hoped that very soon it would be possible to lay the foundation-stone of a block of buildings which would be worthy of the scheme.

The report was unanimously adopted.

The Rev. R. M. Blakiston announced that the inaugural ceremony would be held on the 21st inst., immediately after the afternoon service at Westminster Abbey. All members of the corporation and subscribers would receive tickets of admission, but, as it was probable that the available space would not thus be exhausted, cards would be issued to the general public on application at No. 2 or 10 Dean's Yard.

## TESSERÆ.

### Architecture and Subsidiary Arts.

SIR M. D. WYATT.

I DO most sincerely hope that the preliminary practice of contemplating a building as it should be in its complete form, with its architecture, sculpture, and painting united, which I find obtained universally for so many centuries in Italy, may become a constant practice among us also. I cannot but think that, in the history of the world, there has scarcely been known a country that has reached the pitch of civilisation at which we have arrived which has studied the arts in so isolated and, I may also say, accidental a manner. If architects would only think a little more of the power of decoration and illustration by means of colour, I submit that they would not only build more effectively but more economically (since it must ever be remembered that a large flat surface is one that best of all admits of ornament); and by introducing their ornament in relief sparingly and in the right points they would be enabled to accentuate and emphasise the points to be enforced, and to which the eye should be attracted, and to leave in quietude those which should tranquillise the vision, and lead to increased appreciation of the more salient points.

### Imitation in Architecture.

R. P. KNIGHT.

The fundamental error of imitators in all arts is, that they servilely copy the effects which they see produced instead of studying and adopting the principles which guided the original artists in producing them; wherefore they disregard all those local, temporary, or accidental circumstances upon which their propriety or impropriety, their congruity or incongruity, wholly depend: for principles in art are no other than the trains of ideas, which arise in the mind of the artist out of a just and adequate consideration of all such circumstances, and direct him in adapting his work to the purposes for which it is intended: consequently, if either those circumstances or purposes change, his ideas must change with them, or his principles will be false and his works incongruous. Grecian temples, Gothic abbeys, and feudal castles were all well adapted to their respective uses, circumstances, and situations: the distribution of the parts subservient to the purposes of the whole, and the ornaments and decorations suited to the character of the parts, and to the manners, habits, and employments of the persons who were to occupy them: but the house of an English nobleman of the eighteenth or nineteenth century is neither a Grecian temple, a Gothic abbey, nor a feudal castle; and if the style of distribution or decoration of either be employed in it, such changes and modifications should be admitted as may adapt it to existing circumstances; otherwise the scale of its exactitude becomes that of its incongruity, and the deviation from principle proportioned to the fidelity of

imitation. Common practitioners think every objection answered when some respectable authority is adduced; though perhaps the only point proved by such authority is that the person who uses it does not understand it, or know how to apply it.

### Greek Wall-Painting.

J. J. HITTORFF.

That the use of this species of decoration had been general in Greece will be evident on considering the porticoes of Athens, Olympia, and Delphi, where Polygnotus, Euphranor, and Micon, in depicting the exploits of the heroes of their country, excited their compatriots to imitate their warlike virtues; the Curia, in which Protogenes and Olbiades painted the images of legislators; the theatres and Odeia, decorated with the portraits of poets and the representation of the Graces, their inseparable companions; the Gymnasia, offering to the regard of the spectators the god-like conquerors in the contests of Mars and of the Muses; the Propylæ, more famous for the precious works of the painter than for the marbles with which they were covered; the palaces, houses, and tombs—in which latter historical painting on the wall formed the principal ornament; and lastly, the temples, as in Athens alone, those of Theseus, Erechtheus, Bacchus, Esculapius, and the Dioscuri—the paintings of which were all significant, and in accordance with the places and divinities. We must not, however, confound this characteristic system, common to all the epochs of art in Greece, and which dates back to Egypt, with the no less ancient and general custom of suspending wooden tablets in the sacred edifices to serve as offerings. The most ancient examples of painting on the wall were executed in Italy, as in the Temple of Juno at Ardea; in that of Cæra, of a more remote antiquity; and in that of Lanuvium, where Caligula endeavoured in vain to detach them from the wall, and take them from the ruined temple which they had decorated. Painting in mosaic, whether in the manner of the ancient basilicas, or of the works of the Renaissance, must necessarily have been a tradition of this usage. As to the subject and composition of their paintings, it must be observed that in vase painting, and other decorations of the Greeks, the subjects were often copies of celebrated works, and, therefore, necessarily give a most exact idea of their character and effect. The buckler of Pyrrhus was placed above the doorway of the Temple of Ceres in Argos, and movable portraits were suspended above the mural paintings of Polygnotus in the building contiguous to the Propylæa.

### Roman Road Construction.

A. THOMSON.

We possess original accounts of the Roman mode of constructing roads from two very different sources—the one from the architect Vitruvius, and the other from the poet Statius. The architect gives us clear and distinct specifications, which no contractor could mistake; while the poet describes the busy scene so vividly, that we cannot fail to realise it in all its details. The passage of Vitruvius to which we refer is the first chapter of his seventh book, which is entitled "De Ruderationibus." I know no English word which exactly translates the Latin *rudratio*. It means, as sufficiently appears from the description given, the placing of materials of all sorts so as to prepare a solid and secure resting-place for the superincumbent structure, whether that might be the wall of a house, a floor, a pavement, or a roadway. The object of Vitruvius in writing the chapter evidently is to give rules for ruderation, without regard to the structure which was to be raised upon it, only distinguishing in one part betwixt out-of-door and in-door work; and it might be read without being aware of its application to road-making, did not the remains of ancient viæ show us that their lower strata are formed precisely in the manner he prescribes; and his specifications for each part of the work are so distinct, that they might be carried into execution without difficulty at the present day. The general mode of proceeding, both as enjoined by Vitruvius and as described by Statius, was the following:—The road was lined out as straight as possible, and the width marked by a trench at each side. The next step was to remove the whole of the soil betwixt the trenches to the full depth of the road. If the ground at the bottom was found to be firm and solid, the surface of it was levelled, and the work proceeded—"quærat solum si sit perpetuo solidum et ita exæquatur;" but if not then piles were driven to secure it—"si autem omnis aut ex parte congestus locus fuerit fistucationibus cum magna cura solidetur." Thus a place was prepared to receive the mass of materials which formed the body of the road; this was termed the *gremium*, and the whole purpose of it was to prepare a suitable and durable bed for the upper surface—the pavement or roadway. The *gremium* consisted of three distinct parts—the lowest being the *statumen*, the middle the *rudus*, and the uppermost the *nucleus*. The statumen varied in depth according to circumstances. It was laid upon the surface of the bed of the road, whether the

natural soil or the tops of the piles, and was composed of rough hard stones, not one of which was to be smaller than to fill the hand. The ordinary depth, as seen in sections, seems to have been from 12 to 18 inches. On the statumen was placed the rudus, a mass of small broken stones mixed with lime water, thoroughly beat together and smoothed, and when finished not less than 9 inches thick. Isidorus thus explains what the rudus was:—"Workmen call broken stones mixed with lime poured over them in constructing pavements, the rudus." Vitruvius gives distinct directions for preparing and finishing it. The lime mortar was to be in the proportion of one-third if the materials were new, and of two-fifths if they were old. And after it was laid on, it was levelled and thoroughly beat together by parties of ten men, with heavy wooden mallets, till brought to the thickness of 9 inches, and levelled. Above the rudus came the nucleus. It was a layer of broken bricks, tiles, and pottery, with the addition of a third part of lime mortar, and having, when finished, a depth of 6 inches. Such were the careful preparations to form a suitable bed for the roadway. The roadway itself, in the best roads, was formed of blocks of basalt, the ancient silex (and modern selce), carefully laid by rule and level. These blocks were of various sizes, but usually from 9 to 12 inches deep, and the sides cut into polygons, and so closely fitted together that a newly-made road appeared to be of one stone. This most durable material occurs in many parts of the Campagna, as noticed in a former paper. On each side of a complete road was a footpath raised above the level of the roadway, sometimes paved like the road, sometimes only covered with gravel (*glareâ*), but in either case having a carefully placed margin of stones, termed *gomphi*. The centre of the roadway, the agger, stood higher than the sides, in order that the water might easily flow from it. It is very obvious that roads constructed as now described must have been most durable, and Vitruvius concludes his chapter by asserting that when the foundations have been thus made, they will not soon go out of repair.

#### The Kosciusko Monument.

T. WUNDT.

The method, peculiar to the Slavonic nations, of erecting a hill to the memory of their great men, deserves, in many respects, the preference above our statues, on which our age has squandered so much pious coquetry and sentimental beggary. These natural monuments have not only a duration that defies the elements, and every variety of taste and form, but they are more truly national, inasmuch as they annex in the most simple manner the memory of a great man to popular tradition. The people themselves undertake the work of the artist. In the erection of the Kosciusko monument the whole nation co-operated in the most affecting manner. As soon as the work was resolved upon, at the proposal of Vincent Monkolski, the president of the Civil and Military Tribunal, all, without deference of rank or sex, hastened to offer their assistance. Ladies of noble birth took the spade in their tender hands, and the poor journeyman worked by the side of the proud countess, weeping for her country. Mothers led their ungrown children to take part in the last honours rendered to him, whom all Poles look upon as their father. Old and young, the senator, the warrior, and the peasant, dug together; and even a magnanimous foe, the Emperor Alexander of Russia, with those noble feelings that distinguished him, sent a considerable subscription. Thus the Mogila Kosciusko gradually arose, the earth was sent from all the different provinces, nay, it is said even from America, where Kosciusko began his martial career, and from Solothurn, in Switzerland, which had been the last asylum of the dying hero. The hill crowns the mountain of Bronislawa, so called after the daughter of one of the ancient Polish kings. The name is well suited to this patriotic monument, for it signifies the defender of renown.

#### Mediæval Treatment of Capitals.

W. P. GRIFFITH.

The crypt of Rochester Cathedral contains Norman capitals. Each has a square abacus, 2 feet square and  $4\frac{1}{2}$  inches in depth, and beneath it an ovolo and an astragal or bead; it resembles the capital of the Tuscan order. The piers opposite to these columns have each a similar abacus, with a channel beneath it  $\frac{3}{8}$ -inch deep, and then a cavetto 2 inches deep. This is often used as a string-course. The next kind of capital, which is common, is a modification of the Doric. It has a chamfered fillet on the top, and the original broad flat abacus and ovolo are united; the angles being rounded off form an escalop edge, and under the whole is a bead. Some writers describe the form of this capital as an inverted cone, cut to present four flat sides or faces. By channeling the conical mass a series of escalops are formed, and the spaces below them are sculptured to resemble inverted and truncated semicones. Some of the pier-caps in St. Bartholomew's the Great, London, have six semicones. Of the Norman voluted capitals (after the Ionic) there are many kinds, varying from extreme simplicity, as seen in examples in

Canterbury Cathedral, and in the crypt of Lastingham Church, Yorkshire, to elaborate enrichment, as in St. Peter's Church, Northampton. Adaptations to a certain extent of the Corinthian capital are seen in several of our cathedrals and churches, as well as in those on the Continent. There are other examples of capitals charged with sculptured representations of human figures, animals, foliage, &c., which thus resemble many capitals in the old churches of Normandy. In Late Norman and Early English capitals the foliage is arranged vertically round the bell. In Decorated capitals the foliage flows horizontally. Perpendicular foliated capitals are not common. Small leaves or pateræ are more frequently set at intervals round the shaft above the neck. But the vine and the strawberry leaf are sometimes found, though very differently worked from the deep overhanging foliage of the earlier styles, and forming only a shallow surface ornament. The dog-tooth, the nail-head, the ball-flower, and other ornamental mouldings sometimes occur in capitals, as well as crests of the Tudor flower, or of minute battlements in the later buildings. Even angels' heads with spread wings are found, as in the belfry-arch of Great Shelford, near Cambridge, and in the choir of Wingfield Church, Suffolk. Occasionally (in Norman work commonly) some subject is grotesquely sculptured below the abacus. Of this there is a very curious example at West Keal, Lincolnshire; or a subject is intermixed with the foliage, as in some Early English capitals in the south transept and the north porch of Wells Cathedral. Although there are many beauties in Mediæval architecture, there are also faults. In Pugin's "Gothic Ornaments," plate 86 shows some stone capitals in the entrance to the great hall, Kenilworth Castle; the central one is decorated with the foliage and fruit of the oak; the end of the stem ought to have been hidden, but it is a conspicuous object in the upper part of the capital, and the foliage is growing downwards.

#### Architecture and Engineering.

W. J. M. RANKINE.

In former times, before the division of labour had been carried to the extent which it has since reached, the professions of architect and engineer, and of military as well as civil engineer, were almost always combined in the same man. As an example of ancient date we may take the case of Apollodorus, the architect and engineer of the good Emperor Trajan, who flourished about the end of the first century of the Christian era. As an architect Apollodorus designed many splendid edifices, of which some remains still exist, such as Trajan's pillar, the triumphal arches of Benevento and Ancona, and other buildings. As a civil engineer he planned and executed, amongst other works, the famous harbour of Ancona, and a great bridge across the Danube. That he was also a military engineer is proved by his treatise, still extant, upon engines of war. The most illustrious example of the same kind in more modern ages was Michael Angelo Buonarrotti, who, together with his genius as an architect, sculptor, painter, and poet, possessed consummate skill as an engineer, both civil and military, and in the latter capacity was of eminent service in the defence of Florence. But in later times the subdivision of professions has drawn a line between architects and engineers properly speaking; and when an engineer, as on the present occasion, has to make remarks on architecture, he cannot lay claim to understand professionally more than the physical and mechanical part of the subject. So far as architecture is one of the poetical or fine arts, his knowledge of it can only be that of one of the general public. So far as engineering and architecture consist in applying the science of mechanics to the art of construction, the knowledge required by an architect and that required by an engineer are almost identical. Each of them should understand all those general principles, and all those special properties of materials, upon which depend the three great requisites of an efficient and durable structure—stability, strength, and economy. Stability, that the parts of which the structure is composed may retain their proper positions; strength, that each separate part may be in no danger of breaking under the forces applied to it; and economy, that neither materials nor work may be expended without contributing to the object of the structure. Stability of position depends on the figures and arrangement of the parts of which the structure consists, and the distribution of the load which they have to bear, whether from their own weight or from external pressures; and the principles by which it is regulated form a branch of the science of statics. The civil engineer must understand them, that he may know how to design a wall that shall sustain the pressure of a bank of earth, or a reservoir of water, or a chimney that shall safely bear the force of a storm; how to determine the figure of a tunnel that shall keep its shape at a great depth under ground; the form and properties of the arches and piers of a viaduct of stone or brick; the dimensions and arrangement of the beams of a timber viaduct, or of the bars and plates of one made of iron. The architect has to apply the principles of stability almost exactly to the same extent and in the same way to buildings in masonry, and framework of timber and metals.

THE REVERIE OF POPE PAUL III.

**S**PECULATORS on what might have been if certain events had occurred point to the case of Pope PAUL III. If he could have secured the majority of votes when his predecessor was elected, it is supposed that the Reformation movement would not have attained so much force. For both as Cardinal and Pope, ALESSANDRO FARNESE manifested a desire for reform, and if political complications had not baulked him, he must have been more successful. It is not, therefore, to be supposed that in the incident depicted by M. ALBRECHT DE VRIENDT the Pope is inimical towards MARTIN LUTHER, whose portrait is before His Holiness's eyes. There is more reason for assuming that in his reverie PAUL III. was dreaming of a compromise, and if kings and emperors had not interfered, the Pope's dream might have been realised. The picture is one of several relating to that period which M. ALBRECHT DE VRIENDT has painted, and by them he has proved himself to be at the head of the Brussels school of historical painting.

EDINBURGH ARCHITECTURAL  
ASSOCIATION.

**T**HE annual general meeting of the Edinburgh Architectural Association was held on the 5th inst. The Secretary submitted the annual report, which contained the record of a year of successful work by the Association. During the year the Association had added thirty-four members to its roll, while the withdrawals had been considerably less. The treasurer submitted the financial statement, which showed a balance in favour of the Association amounting to 146*l.*, compared with 170*l.* last year. It was explained, however, that there had been 36*l.* of extraordinary expenditure on account of the furnishing of the new hall and additions to the library, so that the Association was financially in as good a position as last year. Reports submitted on behalf of the Sketch-Book Committee and the Work Class Committee indicated continued success. In the work class there had been twenty-three students, whose work, and the quality of it, showed an advance on the previous year, and prizes gained at the class, and in connection with the sketch-book competition, were presented in the course of the evening. Professor Baldwin Brown was appointed president for the ensuing year; Mr. John Kinross and Mr. Archibald Macpherson, vice-presidents; Mr. T. A. Fairbairn, honorary secretary, and Mr. A. D. Fairbairn, treasurer. The president then delivered his closing address, in which he reviewed the work of the session. In speaking of the work classes, he pointed out how invaluable these were as a supplement to the work of the office; and he thought it was a matter of credit that with so little encouragement so much was being done, and so well. The number of students attending the classes was increasing, and they were a fit subject for special effort to secure external help for their endowment. The several professions in the city had each their centres of teaching, and he argued that the position which architecture held among the professions, and the effect of encouraging it in beautifying the city and making it more attractive, furnished a claim on a share of the surplus from the Exhibition profits. He asked that, before it was too late, a combined effort should be made to petition those who had the distribution of the fund, in the interests of the endowment of these classes. The other leading topic in the address was the subject of registration, and Mr. Blanc argued that the architect could not be brought to the level of test examination. There were, doubtless, minor qualities which went to make up the architect which could form the subject of academic test, but registration could not invest the constructor in the garb of an artist. Architecture should be free, if it would have a healthy, vigorous growth, and in that view it seemed unnatural to make it a close profession. In closing, Mr. Blanc spoke of

the greatness of the architect's profession, which had raised monuments which time itself seemed powerless to destroy. It was fortunate that the art was being fostered again under somewhat favoured conditions; for there was an increasing section of the community which had risen to a sense of healthy artistic feeling which was daily increasing. It was for them accordingly to enlarge that appreciation through the means of their profession.

## GLASGOW INSTITUTE OF ARCHITECTS.

**A** MEETING of this Institute was held in the Religious Institution Rooms on Monday. Mr. David Thomson, president, was in the chair. The President having in feeling terms referred to the death of Mr. James Salmon, I.A., F.R.I.B.A., which took place since last meeting, it was unanimously resolved to place on record the Institute's sense of the great loss thus sustained by it and also by the architectural profession of Glasgow, among whom the deceased was held in the highest estimation. Mr. Salmon was one of the originators of the Institute, took a leading part in its formation, and had all along taken a most lively interest in its proceedings. The Institute has been much indebted to him not only for its formation, but also for much of the success it has achieved. Mr. Salmon has been continuously a member of Council, and he was the first President, and held office for two years. The secretary was instructed to send an excerpt from this minute to Mr. W. F. Salmon, in order to convey to the late Mr. Salmon's family their deep sympathy with them in their time of sorrow.

## DECORATION IN ENGLAND.\*

**A**LL decoration belongs properly to the painter or the sculptor, though it is more often than not done by the architect, but it is no part of his art, though by an extension of meaning a building is sometimes said to be decorated with mouldings. Architecture has its own work and its own laws, as well as others that belong to the arts generally, such as invention. Perhaps the greatest distinguishing mark of architecture as a fine art is to express with æsthetic propriety the destination of the structure, by arousing thoughts proper to that destination; it has to make the whole rhythmical and harmonically proportioned, to give variety and contrast by different shapes, and by different degrees, sizes, and shapes of shade and shadow, to give an appropriate outline, and, where the structure is made up of different parts in different places, to make the whole compose properly. The sculptor gives us the beautiful forms he sees in nature, and mostly those in organic nature, or the beautiful forms he has collected or deduced from nature, sometimes even those that have but a momentary existence, though, like the written word, sculpture is permanent, and except to show his skill or mastery in his art, the subject should be in repose. Sometimes, however, he has to reproduce evanescent expressions and actions, as smiling, frowning, laughing, crying, &c., and running, wrestling, boxing, quoit-playing, javelin-throwing, riding, driving, or swimming, a moving procession, or a battle; and in portraits he has to give us the individual lineaments, features, and the habitual expression with truth, though he does well to emphasise the nobler traits. I think I may say what we ask of him is to give us beauty of form in a permanent material, or to raise noble emotions in our souls, and to truthfully portray the form and lineaments of those we love, admire, or venerate. Though we mostly only ask for the natural shape, we do not deny him the use of drapery when that is noble or beautiful in form. But we do not ask the true sculptor to give us that which is not beautiful or ennobling merely because it may some day be archæologically interesting, like the Highlander at the snuff shop.

Painting, as far as form goes, is merely sculpture from one point of view, and what is said of the former may be equally said of the latter. What we ask of the painter is beauty of colour, or colour that arouses noble emotions; or in the case of portraiture, that which represents the actual facts; and when sculpture is not painted, as is mostly the case in statuary, painting can give atmospheric effects denied to statuary and unpainted sculpture.

If our own history is so bare of subjects that are worthy to be painted or sculptured, or the people are so ugly and badly dressed that it is merely ridiculous to portray them, we have the whole of the Scriptures at hand for the adornment of our churches, chapels, and cathedrals, and these have plenty of empty niches for statues, vacant pedestals for groups, pediments for reliefs, and covered porticoes for pictures in mosaic, without speaking of their interiors. Means in the shape of money are plentiful, nor is there a lack of artists, nor a difficulty in obtaining the requisite materials.

\* From the first Cantor lecture, by Mr. G. Aitchison, A.R.A.

The same sort of compliment might be paid to this generation that one of the Greek kings paid to a soldier. He said, "He was like a sword-fish; he had a sword, but no heart."

We are a nation of sailors, and for some of our public buildings a depiction of sea-fights or even of fleets of merchantmen would not be amiss; and if the grim ironclad, like a black porpoise, is felt to be wanting in picturesqueness, the curved prow, high stern, and swelling sails of early ships have always been a favourite subject with artists. Besides, if we have not stirring episodes enough in our own history for enriching public buildings, we can fall back on our own poets.

It may at first be thought that there are the fewest resources for houses, yet most persons, even if their whole life has been occupied in respectable plodding for gain, have at least had some episodes in the history of their family that are fit for sculpture or painting. There are incidents, too, in each man's calling which can be portrayed, not to speak of the whole of the poetry of the world.

Lord Beaconsfield said, "Adventures are to the adventurous," and the pith of this remark may be applied to picturesque or sculptural subjects, as well as to poetic ones. M. Van Haanen, at Venice, saw that stringing beads was a picturesque subject, and being a fine painter, made a splendid picture of it. I was once in a lace mill at Nottingham; the room, with the girls cutting up the lace, would have made an equally good picture had I happened to be a fine painter. In the most prosaic age there is stuff enough for poetry; in the most tasteless age there is beauty enough for fine pictures and sculpture, if there were poets, painters, or sculptors to appreciate and properly execute the beautiful things they hear or see; though we can hardly expect executants where there are no admirers. You all recollect Hogarth's etching of the hogs routing in the dunghill, while a celestial choir is singing above.

But even if these are not enough, there is the whole of nature before you. Wild beast patterns are favourite subjects in the East for pottery, carpets, stuffs, and hangings. You must have a cat, a dog, or a canary bird. You have horses and sparrows before you, and not unfrequently, even in London, you may be visited by a pigeon, or a robin, if you put crumbs on your window-sill; and if you do not care for these, you can have medallions of your own head and of those of your family joined in a band of formal ornament. This would be a great improvement to a wall with holes in it of common brick.

What may be called formal ornament is the application of certain observed facts in nature that please. Up to a certain point the repetition of some simple form is pleasing; lines are said to be divided harmonically when they have certain ratios to one another, and spaces may have similar proportions, and these as well as certain curves give more pleasure than others; the combination of some flat and sharp curves is also found to be beautiful; the contrast of certain forms and of certain colours also gives pleasure. It is the evolution by man of these observations properly applied to things he wants that makes them ornamental, and their superposition on elegant forms is said to decorate them.

Mr. W. Morris once said, "People nowadays do not want what is beautiful, but what is new." This, however, is not wholly true, for people really want what is beautiful, as well as what is new. They know what is new, but they do not know what is beautiful, and make the mistake of accepting the new which they do know, instead of taking the old which is beautiful, when they cannot get both.

The number of creators in every art or science is small. I might say that great creators are scarcer than diamonds. We all feel that we are greatly in want of inventors and discoverers in every art and science. I will put a case that comes home to everyone in medicine. A great deal has been done in the present day in preventing illness. If we could get an instrument that bore the same ratio to the microscope as this does to the human eye, it is quite possible a great stride would be made in medicine, and every sick person would be a gainer.

The thing is to find your genius, and to make it worth his while to invent what you want; you must first know what you do want, and then you must honour and reward the inventor. A healthy, vigorous and virtuous population, with high aims, is the most likely stratum from which a genius may come; he then wants the opportunity of cultivating his powers in the right direction, and when he has invented, rewards in the shape of general esteem and honours, and, as often as not, in wealth. Though Socrates and Diogenes scorned wealth, Plato and Aristotle did not; and we all know Plato's answer to Diogenes, who said, when stamping on his purple carpets, "Thus do I trample on the pride of Plato." If you make it easy for every rascal to steal his invention, and deprive him of his labour, you do all that in you lies to discourage invention, and this is as true of ornament as of everything else. I believe in the great days of ornamental invention the ornamentalist was highly rewarded, both in wealth and honour. Nowadays, the man who finds the wool, the clay, the cotton, or the wood, or buys the machinery, or packs the goods, or what not, gets all the advantage, and he who confers its value

on the article almost nothing. I heard of a designer who sold for three guineas a design that took. The manufacturer gave up the manufacture of everything but that article for some years, and probably made his fortune, but he never gave the designer an extra sixpence. I think the leading idea of many manufacturers is how to steal a design. Had not Carlyle got some able man to negotiate for him he would have died a pauper, and all the profit of his works would have gone to the publisher.

Almost all our best patterns have come from the East, and I know that there the designer is highly paid, and gets a heavy royalty on every piece that is woven or embroidered from his design.

In the story of Alee-shér and Zumurrud, Zumurrud had probably learned the design by heart, but the embroidering alone was well paid for. She gives Alee three pieces of gold to get their food and drink for the day, and for a piece of silk, and she directs him to get "as much as will suffice for a curtain, and buy gold and silver thread and silk of seven different colours. . . . The damsel took the curtain, and embroidered it with coloured silks, and ornamented it with gold and silver thread; she worked a border to it with the figures of birds, and represented around it the figures of wild beasts, and there was not a wild beast in the world that she omitted to portray upon it. She continued working upon it for eight days, and when it was finished she cut it and glazed it, and gave it to her master, saying, 'Sell it for fifty pieces of gold.' If we allow two pieces for the stuff, the silks, and gold and silver thread, she got six pieces of gold a day. Even if we took gold at its present value, though it has enormously diminished in value, it is three guineas a day, which cannot be considered a bad professional income for an embroideress, even if she furnished the design.

There is one more subject I want to touch on, the value of old work. The older the work is, as a rule, the more likely is it to be good, for the less good things have perished by the way. Some one illustrated this effect of time by comparing it to a man who went to settle in the backwoods with a large library. The farther he got from the tracks of civilisation the harder and more expensive he found it to carry many books, so he gradually threw them away, till on his arrival at his destination he had only half a dozen, and these, of course, were those he considered the most perfect, and which he set the most store by. Each epoch that had high aims, superior people with great skill in their art, much competition and able critics, naturally produced the best works; in after times those who practised the same art highly valued work that was better than they could do.

That which is the most perfect in ornament is the work of people gifted with high artistic fibre and faultless execution, to whom nature appeals in her masterpieces, who assimilate some of the matchless grace they see in a flower, in the turn of a leaf, in the curves that mark the growth of a creeper, in the wing of a bird, the curve of a lizard, or the knots or spirals of a serpent; who can so arrange these forms as to perfectly satisfy the cultivated eye, and keep them subordinated to the containing lines; such things may be seen in examples of Greek and Tuscan, or rather North Italian, ornament. This sort of ornament by some mishap has got christened Conventional, which has no meaning as applied to ornament, and should rather be called Abstracted.

Colour is another species of ornament that, like form, has doubtless its laws, though, as yet, neither have been discovered, and we call form and colour, like medicine, empirical arts. We observe that the collocation of certain spaces, or masses of certain colours, give us more pleasure than others, and we try and recollect these collocations if we deal in colour, and use them when we have occasion.

It has been observed that the primaries that are complementary—i.e., whose mixture produces white—go well together, and that certain secondaries and tertiaries set off primary colours. Chevreul found that the saturation of the eye with a colour caused it to see the complementary colour if a white surface was looked on. Every one knows this from Pears's advertisements. And Chevreul also found out that if we looked at another colour, it was modified by the complementary colour of the first. He wrote a long book about it, mainly consisting of examples of this one observation.

There is little else to say, except that when a full or deep scheme of colour is settled on white must be used sparingly, like a jewel, and that when a light scheme is used black has the same value, and that all pure colours if used on a white or very light ground must be pulverised—i.e., used in minute particles, or very light tones only be adopted. Aristotle remarks (*Politics*, Lib. 4, cap. 7) that the inhabitants of Europe, "while full of spirit are comparatively deficient in intelligence and artistic skill"; while "the nations of Asia, on the other hand, although intellectual and artistic, are wanting in spirit." This is still true for colour only, for the reproduction or invention of exquisite form is now the prerogative of Europe, and of those Europeans who have colonised other parts of the globe. The

products of Asiatic looms and potteries are to be studied for magnificence, beauty, and exquisiteness of colour, as well as the works of nature. As a penance it may occasionally do us good to be surrounded with ugly forms and discordant colours, to pass an hour or two in the parrot house of the Zoological Gardens, to cover ourselves with ashes, and to eat nauseous food. But to condemn ourselves to this perpetually is not to acquire virtue, but to brutalise ourselves, and to throw away the good gifts the Almighty has provided for us.

### ROYAL ACADEMY ARCHITECTURAL SCHOOL.

THE following students have been admitted to the Architectural School:—

*Students' Upper School.*—T. D. Bedford, T. Davison, W. M. Duke, C. S. Haywood, W. F. Horton, H. P. Lanchester, F. C. Ryde, C. S. Spooner, and F. J. Verity.

*Students.*—T. C. Agutter, C. J. Blomfield, L. C. Cornford, A. Mackintosh, E. A. Rickards, W. J. W. Roome, W. Sheen, J. C. Watt, and E. J. A. Wigram.

*Probationers.*—F. W. Bedford, D. J. Blow, W. A. Fenn, J. W. Little, J. G. Oakley, J. Paxton, A. M. Poynter, J. Rawlinson, F. E. Smee, E. W. M. Wonnacott, and P. S. Worthington.

### FOREIGN MUSEUMS.

A RETURN has been presented to the House of Commons showing the hours of opening, organisation of staff, and conditions of admission on Sundays in summer and winter in the national and municipal museums, galleries, and collections of the cities of Paris, Berlin, Amsterdam, New York, and Philadelphia.

#### Paris.

The hours of opening of the principal public galleries owned by the State or Municipality in Paris and the neighbourhood are stated in the following table:—

1. Museums, &c., under the Direction des Musées Nationaux (Ministry of Beaux-Arts):—

Louvre . . . . .	April 1 to October 1, 9 to 5 daily.
Luxembourg . . . . .	October 1 to April 1, 10 to 4 daily.
Versailles . . . . .	Sundays all the year round, 10 to 4.
St.-Germain . . . . .	Closed on Mondays for cleaning.

2. Museums under the Direction des Monuments Historiques (Ministry of Beaux-Arts):—

Cluny . . . . .	April 1 to October 1, 11 to 5 daily. October 1 to April 1, 11 to 4 daily. Closed on Mondays for cleaning.
Musée de Sculpture Comparée . . . . .	11 to 4 daily. Closed on Mondays for cleaning.

3. Museums, &c., under the Ministry of Public Instruction:—

Natural History collections . . . . .	1 to 4 daily, except Mondays.
(Jardin des Plantes)	
Ethnographical Museum . . . . .	Sundays, Mondays, and Thursdays, 12 to 4 (or 5 in summer).
(Trocadéro.)	

4. Museum under Ministry of War:—

Artillery Museum . . . . .	Tuesdays, Thursdays, and Sundays, 12 to 3 (or 4 in summer).
(Invalides)	

5. Museums, &c., under Municipality:—

Musée d'Auteuil (for plans, architectural drawings, &c.) . . . . .	Thursdays and Sundays, 1 to 4.
Musée Carnavalet (records illustrating history of Paris, and especially the French Revolution) . . . . .	Library daily on week-days, 10 to 4 (or 5 in summer), except a week at Easter, and from August 15 to October 1.

It will be seen that all these galleries and collections are open to the public on Sundays, and that when they are only open twice or three times a week, Sunday is always one of the open days.

The following is the staff of the four great collections which are placed under the Department des Musées Nationaux (Louvre, Luxembourg, Versailles, St.-Germain):—Nine conservators (220*l.* to 280*l.* a year), charged respectively with the departments in those collections (a) of marine; (b) of painting and drawing; (c) of Egyptian antiquities; (d) of Oriental antiquities; (e) works of art of the Middle Ages, Renaissance, and modern times; (f) ancient sculpture; and the general superintendence and maintenance of the collections (g) of the Luxembourg, (h) Versailles, (i) and St.-Germain. Five assistant conservators (at 100*l.* to 180*l.* a year), assigned to the departments of painting and drawing, Egyptian antiquities, Oriental antiquities, works of art of the Middle Ages, Renaissance, and modern times, and ancient sculpture. Eight attachés à la conservation (100*l.* to 160*l.* a year), two assigned to

the department of painting and drawing, and one to each of the departments of Egyptian antiquities, Oriental antiquities, and works of art of the Middle Ages, Renaissance and modern times, besides one specially assigned to the Luxembourg, Versailles, and St.-Germain respectively. One secretary (accountant), receiving 240*l.* a year, and one assistant secretary at 200*l.* His office is served by five clerks, at 72*l.* to 144*l.* a year. Three of these clerks belong strictly to the office, and two to the atelier, or workshop, for the sale of casts, &c. One secretary (accountant) for Versailles. One librarian (160*l.* a year), and an assistant librarian for the Louvre. The task of watching and keeping order in the galleries of the four great national museums is confided to a staff of 158 men, composed and paid as follows:—

2 chefs . . . . .	£80
5 sous-chefs . . . . .	74
17 brigadiers . . . . .	70
132 guardians (divided into four classes of 33 men each) . . . . .	54 to 66

Most of these are taken from lists of old non-commissioned officers submitted by the Minister of War. They are distributed among the four museums as required from time to time. Besides its own contingent, Versailles has also forty-four servants to help in watching the galleries. Three medical men, at a salary of 96*l.*, attend the guardians in cases of illness. The Louvre includes four workshops or studios (*ateliers*):—(1) for casts, with a *chef* and nine workmen; (2) chalcography, with a *chef* and two workmen; (3) sculpture, with a *chef* and six workmen; (4) naval subjects, with a *chef* and two workmen. A further staff of workmen is employed as required for repairs, framing pictures, &c. All the guardians, workmen, &c., are clothed by the State. The total cost of the staff (*personnel*) of these museums is set down in the annual budget at about 17,000*l.*, or about half their total annual cost to the nation.

The remaining museums and galleries of Paris are placed under the special department to which their object belongs, as indicated in the table given at the beginning of this memorandum. The Museum of Cluny is managed by a director and sixteen guardians, the Musée de Sculpture Comparée by a conservator. The officials are paid as in the museums under the Direction des Musées Nationaux. The natural history collections are under the management of nineteen professors (400*l.* a year), two drawing-masters (60*l.*), one librarian, and one assistant-librarian at 160*l.* a year each, one secretary (200*l.*), and twenty-four assistant naturalists (120*l.* to 200*l.*), making an annual total for *personnel* of 12,000*l.* The Ethnographical Museum costs nearly 1,000*l.* a year. The Musée d'Auteuil, which is not yet open, is to be placed under a conservator and a small number of Gardiens de Bureau, a category of servants in the employment of the Municipality. The Musée Carnavalet is managed by one conservator, three sub-conservators (one specially assigned to the museum proper, and the other to the library). Only four servants are directly assigned to this museum, but on open days the Municipality supplies as many of the town police, generally only four or five, as may be wanted for watching and keeping order. The museum pays them one franc a day when thus employed. The whole cost of the staff of the Musée Carnavalet is about 800*l.* a year.

#### Berlin.

There is no uniform system of regulations for the times of opening and the constitution of the staff in the public collections belonging to the Prussian State.

In the natural science collections all is at present in process of formation. The collections of the Museum of Natural Science cannot at present be seen by the general public, since, on account of their removal from the University to the new buildings, which is still in process, they are partially still packed away in cases, and not yet set up again, and partially still awaiting packing and removal; moreover, all the rooms are not yet properly arranged to receive them. A decision will, therefore, only be come to later respecting hours of opening and staff.

In the institutions under control of the General Administration of the Royal Museums, viz., Old Museum, New Museum, Museum of Ethnography, and Museum of Industrial Art, the times of opening are regulated as follows:—

1. On week-days, with the exception of Mondays. (a) For the royal museums in the Lustgarten (*i.e.*, Old and New Museums) in the winter season (October 1 to March 31), 10 to 3 o'clock; in the summer (April 1 to September 30), 9 to 3 o'clock. This regulation has only come into force during the current summer in place of the old rule (10 to 4), experience having shown a very thin attendance in the last hour, and therefore recommended the alteration. Experience has not yet sufficiently proved the benefits of this change. (b) The Ethnographical Museum hitherto on Saturdays only—winter, 10 to 3; summer, 9 to 3; fixed by the same dates as in (a). The limitation hitherto existing to one day open in the week besides Sunday was necessitated by the fact that the energies

of the staff were occupied in the labour of setting up the collections. This will shortly cease, and the Museum for Folk Lore will then be opened under the same conditions as the above museums in the Lustgarten. (c) The Museum of Industrial Art daily from 10 to 3. In this case also, if the experiment of the hours alluded to under (a) and (b) proves successful, the open period in summer will be extended from 9 to 3.

2. The royal collections are all open on Sundays and on the holidays following—Easter, Whit-Sunday, and Christmas day—from 12 to 3, in summer and winter alike.

3. All the royal museums are closed on Easter day, Whit-Sunday, Christmas day, Good Friday, Atonement days (there are two of these in the year—one universal in Germany, one special for Prussia—when all the shops are shut, and work suspended), Ascension day, as well as on every Monday, for cleaning purposes, with the exception of Easter and Whit-Mondays.

The inspection of the museums is, however, also allowed on other days besides those publicly open, except on the great festivals, especially on Mondays, on production of special cards of admission signed by the general director and the director of that special department to which admission is desired. Such cards are issued almost without exception to students alone. Educational establishments wishing to organise lectures in the rooms of the royal museums are allowed admission under conduct of the lecturer, during closed hours, with special admission cards and under the necessary prudential limitations.

Admission to all the above galleries is free, with the exception of the Industrial Art Museum, to which admission on week-days involves a charge of 50 pfennig (6d.).

The organisation of the staff is regulated by the Statute of the Royal Museums at Berlin of May 25, 1868, and by the regulations for the disposition of the directors of departments, and for the application of the funds at the disposal of the royal museums, dated November 13, 1878. Copies of these are annexed.

The Royal National Gallery collections, consisting of sculpture, paintings, and drawings by German artists of the present century, is open free in summer and winter, from 10 to 3 o'clock daily on week-days, but Mondays from 1 to 3 only; on Sundays (except on the great festivals of the Church) from 12 to 3. A daily cleaning takes place before the hours of opening, and a thorough cleaning every Monday.

Tuesdays and Wednesdays are copying days. On other days no copying is allowed, in order not to hinder the public from a free view of the works of art.

A director is entrusted with the management of the institution, with one assistant director to aid him. Office affairs are dealt with by three clerks (having rank of "Expedient," "Kalkulator," and "Registrator"), with one assistant clerk. The "Kastelan" of the Royal National Gallery, who has under him the staff of gallery attendants, a porter, a heating engineer, and one odd man, as well as the hired working-men and work-women, is entrusted with responsibility for the safety and cleanliness of the building. The gallery attendants, who are divided into three classes, are ordered to maintain a strict watch over the collections during the open hours, as well as during all operations of receiving, placing, or cleaning the works of art.

#### Amsterdam.

The principal museum of Amsterdam is the well-known Rijks Museum, containing the pictures of the great Dutch masters. This museum is open free every day, Mondays excepted, from 10 to 4 in winter (September 1 to April 30), and from 10 to 5 in summer (May 1 to August 31). The staff consists of a superintendent, two sub-inspectors, and thirty-five men, who are supplemented by twelve soldiers on the Sunday, the number of visitors being on that day greatly augmented. The only other museum of any importance is the Museum Fodor, owned by the Municipality. This museum is open every day, Tuesdays excepted, from 10 to 4, from February 1 to November 1, and during the other three months from 11 to 3. The charge for entrance on week-days is 10d., and on Sundays 5d., and the whole staff consists of two attendants.

#### New York.

There are no State or Municipal galleries in this city. The buildings of the Metropolitan Museum of Art and the American Museum of Natural History were erected by the Department of Public Parks of this city in Central Park, and the expense thereof was paid by bonds issued by the city. The Department of Parks is authorised by an Act of the Legislature to apply a sum not exceeding 30,000 dols. per annum for the keeping, preservation, and exhibition of the collections which are placed in these museums. Both of the institutions are private corporations, and in consideration of the action of the municipal authorities in erecting the buildings and appropriating a certain sum per annum for their support, the general public are admitted free on Wednesdays, Thursdays, Fridays, and Saturdays, and the Comptroller of the City and the President of the

Department of Public Parks are *ex-officio* members of the Board of Trustees. The museums are open on week-days at 10 A.M. throughout the year, and close at sunset or 6 P.M. They are closed on Sundays.

#### Philadelphia.

There are but a few public galleries in Philadelphia city that are opened to the public on Sundays, the chief among which are the Academy of Fine Arts and the Academy of Natural Sciences. The three others—Fairmount Park Collection, Memorial Hall, and the Pompeian Views, all located in the Philadelphia Park Grounds—are not of so much importance or interest to the general public. The Academy of Fine Arts is open to the public on Sundays from 1 P.M. to 6 P.M. (or until dark during the short days). On Sundays and Mondays there is no charge for admission, a regulation required by the Temple Endowment Fund. All other days the admission is 25 cents, or 1s. The regulations of the other galleries and collections referred to as open on Sunday are similar to those of the Academy of Fine Arts. The staff or governing body of these institutions consists of a president, one or more vice-presidents, a treasurer, a secretary, and board of trustees of a large or small number of members; the services of the staff, except in the case of the secretary, are performed gratuitously. The Fairmount Park Collection, Memorial Hall, and the Pompeian Views belong to the Philadelphia Park, and are free to the public.

#### GENERAL.

**The Queen** has given sittings to Mr. John Hutchison, R.S.A., for the bust which is to be placed in the Victoria Art Galleries, Dundee.

**Mr. Burne Jones** has resumed work on the four large pictures commenced many years ago, illustrating *The Legend of the Briar Rose*, or *Sleeping Beauty*.

**The Sixty-eighth Exhibition** of works by modern artists is to be opened in the Manchester City Art Gallery on Sept. 4. The number of works to be contributed by any artist is limited to three, which must be delivered at the gallery between Monday, 23rd, and Saturday, 28th inst. Over 2,000l. is at the disposal of the committee to purchase works for the permanent gallery.

**The Arcading** for "Brown's Chapel," in Manchester Cathedral, has been begun under the direction of Mr. J. Crowther.

**The Works** of the Victoria Infirmary, Langside, Glasgow, have commenced, the architects being Messrs. Campbell Douglas & Sellars.

**The Privy Council** have authorised the expenditure of 6,000l. in improvements at Londonderry District Lunatic Asylum.

**Mr. J. W. Trounson**, Penzance, has been appointed the architect for the new Post Office Buildings, St. Ives, Cornwall. Designs prepared by Mr. J. W. Trounson, have also been selected for the new Wesleyan Chapel, Penryn, Cornwall, and the work will be proceeded with forthwith.

**Mr. Edwin Seward**, vice-chairman of the South Wales Sketching Club, Cardiff, announced at the meeting of the members that the president, Lord Windsor, had invited the members to visit St. Fagan's Chapel.

**The "City Press"** states that the freedom of the Grocers' Company will be presented to Sir Frederic Leighton on the 25th inst.

**Mr. W. M. Baker**, of Hasfield Court, Gloucestershire, has undertaken the cost of the erection of the new public buildings at Fenton, of which Messrs. R. Scrivener & Sons, of Hanley, are the architects, and the foundation-stone of which has just been laid.

**A Committee** on the part of the Bury Corporation, who are desirous of establishing a technical institute for the town, have paid visits of inspection to the institutes at Chorley, Preston, Bradford, Keighley, Huddersfield, and Manchester.

**The Walsall Town Council** have arranged with the Earl of Bradford for the acquisition of over 12 acres of waste land at Bloxwich, for the purposes of a recreation-ground.

**The Wesleyans** of Salisbury have decided to reseat and make alterations to their chapel, at a cost of 1,000l. to 1,200l., and have appointed Mr. Fred. Bath, F.R.I.B.A., of Crown Chambers, Salisbury, as their architect.

**The Lancashire and Cheshire Antiquarian Society** have taken steps to secure the safety of any relics of a past age which may be discovered in the course of the Manchester Ship Canal excavations, and have caused a circular to be printed for distribution among the men, giving illustrations of arrow heads, stone hammers, axes, &c.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. **ROBERT BOYLE & SON, Ltd.**

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JULY 13, 1888.

## TENDERS ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

## EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## CONTRACTS OPEN.

BANBRIDGE.—July 18.—For Repairs to Unitarian Church. Mr. Hugh Glass, Solicitor, Banbridge, Ireland.

BANBRIDGE.—July 14.—For Repairs to Bannside Presbyterian Church and Building Lecture Hall. Mr. W. J. M'Keown, C.E., Banbridge.

## WINKTON.

For Rebuilding The Lamb Inn. Mr. H. E. HAWKER, M.S.A., Architect, Bournemouth.

JENKINS & SON ( <i>accepted</i> ) . . . . .	£650	0	0
---	------	---	---

## TRADE NOTES.

AN alarming subsidence took place last week on market day in the yard of the Wheatsheaf Hotel, Northwich, when the yard was crowded with the horses and traps of farmers. A large portion of the open yard and of the floor of the adjoining stabling suddenly gave way. Several persons had narrow escapes, and one horse was engulfed.

SIR JAMES PICTON and others of the Liverpool magistrates, in company with Mr. Sumners, the architect, inspected the alterations at the Court Theatre on Monday, and expressed their satisfaction with the fire-resisting curtain that is being constructed by Messrs. Clark, Bunnett & Co.

A LARGE clock has just been erected on the church tower at Baconsthorpe, Norfolk, by Messrs. John Smith & Sons, Midland Clock Works, Derby, which is fitted with all the improvements introduced by this firm. It has one face 5 feet across, and strikes the hours.

ALTERATIONS have been made in the Local Board Offices, Old Charlton, embracing the ventilation, which is now carried out on the Boyle system, the vitiated air being extracted by the latest improved form of the patent self-acting air-pump ventilator, while the fresh air supply is admitted by Boyle's latest improved air inlets.

A MEETING is announced to be held in the Council Chamber, Town Hall, Newcastle, on Monday, 16th inst., at 7.30, to consider the registration of qualified plumbers as a measure for securing the higher efficiency of Plumbers' Craftsmanship in the interests of public health. The Worshipful the Mayor of Newcastle will preside, supported by the Recorder of Newcastle, the Principal of Durham College of Science, and members of the medical profession, &c. Deputations will also attend from the Corporations of Stockton, Darlington, Gateshead, Tynemouth, and other towns.

THE additions to St. Thomas's Church, Monmouth, have recently been completed, Mr. F. A. Powell being the architect. The church is now warmed throughout by means of one of Shorland's patent underground hot-air stoves fixed under the vestry, and supplied by Mr. E. H. Shorland, of Manchester and London.

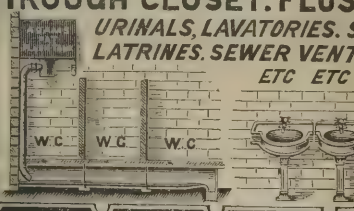

MR. J. NEALE BAKER, having terminated an engagement of twenty-two years as accountant and traveller for the *Hereford Times*, has commenced business as auctioneer, accountant, &c., at 28 Widemarsh Street, Hereford, and from his long experience he is competent to undertake the settlement of accounts and balance-sheets, however complicated.

SOME valuable freehold building land, in an eligible position at Finchley, was offered for sale by public auction on Thursday evening by Mr. W. R. Norris, of 29 & 30 Southampton Buildings, Holborn.

THE extension of Lofthouse Church has been commenced from the designs of Mr. William Watson, of Wakefield.

THE Messrs. J. & P. Coats, thread manufacturers, Paisley, require two powerful and separate engines in their extensive new twisting mill in course of erection at Ferguslie, and have given the order for one of the engines to the Paisley firm, Messrs. Fullerton, Hodgart & Barclay, and the other to a

Lancashire firm, Messrs. John Musgrave & Son, Bolton. Each engine is to be complete by itself, and will be of 2,000 horse-power, with a fly-wheel of 32 feet diameter. For both engines this will be a total of 4,000 horse-power.

THE old parish church, Thame, being in need of structural repairs, it was decided at a meeting of the parishioners held last week that a scheme of restoration, as recommended by Mr. Wilkinson, should be commenced.

PLANS by Messrs. Whitfield & Thomas, London, have been adopted for proposed alterations at St. Paul's Church, Tottenham, and estimates for carrying out the work are to be obtained.

THE Derby Town Council have passed a vote of condolence with the relatives of the late Mr. Coulthurst. The Council also considered the steps which should be taken as to the appointment of a successor. Under the late arrangement the Borough Surveyorship was worth about 700*l.* per annum.

#### THE CONCRETE OF THE ABERDEEN GRAVING DOCK.

A LENGTHY report by Mr. Philip J. Messent, C.E., has been prepared as to the quay walls of the Aberdeen Graving Dock. The harbour quay walls, Mr. Messent says, formed a portion of the Albert Graving Dock contract, commenced in 1881, and the quay walls by which the Graving Dock site was partially enclosed were completed in 1883. The total length of the walls on coping level according to the contract is 882 feet, of which 674 lineal feet are on the south side of the dock and entrance, and 208 lineal feet at the east end. The quay walls now form continuations of the wing walls of the dock entrance, and during the construction of the dock they formed a continuation of the cofferdam used for the work. They were made of concrete faced with granite from  $3\frac{3}{4}$  feet above low water to the coping, and were partially supported on a row of sheet piling,  $5\frac{1}{2}$  inches thick and 8 feet long near the face, and a row of bearing piles, 12 inches diameter, 8 feet long, and spaced 4 feet apart near the back. The bottom of the concrete and tops of the piles are approximately at the level of  $11\frac{1}{4}$  feet below low water spring tides. The top of the walls, coped with granite, are  $17\frac{3}{4}$  feet above low water at, and eastward of the entrance to the Graving Dock, falling by an inclination of about 1 in 100 to  $15\frac{3}{4}$  feet, at a distance of 200 feet west of the south-east angle of the wall. They are 12 feet thick or wide

at the base, and 10 feet at the level of  $3\frac{3}{4}$  feet above low water, the face, from 7 feet below to  $3\frac{3}{4}$  feet above low water, being vertical, above which, to the top, it has a batter of  $\frac{1}{2}$  inch per foot. According to the contract plans and specification, the base, for a height of 3 feet, was to be composed of concrete made of Portland cement, sand, and gravel, in the proportions of 1 + 3 + 4, deposited soft in bags, whilst the concrete above this, for a height of 12 feet, or to about  $3\frac{3}{4}$  feet above low water, was to be composed of a facing 2 feet thick, of strong concrete, made of 1 part cement,  $1\frac{1}{2}$  sand, and 2 gravel, the upper portion of the wall being made of concrete comprised of 1 part cement, 2 sand, 3 gravel, and 4 of stones, faced with granite ashlar. After the contract had been entered into, but before the commencement of the work, the specification was altered as follows, the alteration being necessitated by the experience gained in this method at Provost Jamieson's Quay:—"For the concrete in bags in foundation, the fine concrete facing, and the concrete behind the fine concrete facing, were substituted a homogeneous mass of concrete, deposited inside frames, composed of 5 measures sand and stones to 1 of Portland cement for one-third of the depth of the frame (i.e., from  $11\frac{1}{4}$  to  $6\frac{3}{4}$  feet below low water), and of 7 measures of sand and stones to 1 of Portland cement in the upper two-thirds of the depth of the frame (viz., from  $6\frac{3}{4}$  feet below, to about  $3\frac{3}{4}$  feet above low water spring tides), with an addition of, on an average, 10 tons of large stone to each frame of 15 feet length of wall." The concrete in the above described part of the walls, viz., from  $11\frac{1}{4}$  feet below to about  $3\frac{3}{4}$  feet above low water, was executed and deposited on what is termed the "plastic system." The peculiarity of this system consists in allowing the concrete, after being mixed, to remain in air for a few hours, and to partially set before it is placed in the work, below water—for the operation of placing it in the moulds, boxes or skips, with doors opening at the bottom and lowered by cranes, being used. This mode of using concrete is of comparatively modern introduction, and is at variance with the long-adopted practice of engineers and their opinion, that cement concrete or mortar, when it had once commenced to set, was injured or deteriorated by being disturbed, and was so prevented from ever attaining strength, such as it would have attained had it been undisturbed. In a paper by the author or inventor of the system, read at the Institution of Civil Engineers, in 1886, the author, describing experiments made by D. M'Allister, states that they "show that  $3\frac{1}{2}$  to 1 concrete, after setting out of water

for eighteen hours, and then rammed into moulds, will form a monolithic mass when afterwards placed in water; but the strength of this mass will very much depend upon the time allowed for setting before deposition. If only eight hours elapse between mixing and deposition, there is practically no reduction in strength, but with a longer interval the strength is gradually reduced, until, at about eighteen hours, it is little more than one-half." My experience is not confirmatory of the above, and I believe that a considerable reduction in the strength of concrete will result if even less "than eight hours elapse between the mixing and deposition." It is, however, possible that, notwithstanding the reduction of strength by the plastic method (in some measure admitted by the author), that there may be still sufficient strength left in the concrete so used for the work that it has to do, supposing it to be exempt from future deterioration. The result of my examination of the plastic concrete now under consideration is that it is certainly not as strong as ordinary concrete composed of the same proportions of cement, sand, and gravel should be, although it is solid and compact, and probably in most cases still strong enough for its work, especially if it is not in course of deterioration. As to this, Mr. Smith and Mr. Pirle assured me that, in their opinion, it had not deteriorated in strength during the last four or five years. From this opinion it appears probable that this, the submerged portion of the wall, has not suffered from the chemical action of the sea water with which it is in contact, but I rather regret that this most probable assumption has not been indisputably verified by a chemical analysis. As to the general design and construction of the walls, although I would have preferred that the solid structure should have been several feet lower, which would have probably prevented the entrance of tidal water under the walls referred to on page 18 of my report of November 24, 1887, I do not think that, up to the present time, the absence of that arrangement has caused any serious damage or inconvenience. In my examination of the whole length of the walls on March 29 I found some cracks, a few leakages, and some irregularities in height and line, but the only part that seemed, in my opinion, to require immediate permanent repair was the east portion of the wall facing the sea, or entrance to the harbour, and a small portion of the south wall. The east part of the quay wall, as well as a considerable length of the south portion, suffered an extraordinary strain, for which it was not designed or constructed, by being subjected to the pressure of a head of

tidal water in 1883, before the embankment behind was completed. By this pressure it was moved and cracked, and, although the visible defects were repaired, and other protective additions were made, a strain that would cause such movements and fractures would, in my opinion, also weaken other portions of the structure, although such weakening may not be outwardly apparent. The east quay wall adjoins the south wing wall of the Graving Dock, and, whilst it is in the most exposed position, it is in a shaken and unsatisfactory state. I am, therefore, of opinion that it would be advisable to repair and strengthen it, as well as a short length of the south wall, with as little delay as possible. The suggested strengthening consists of a concrete apron, similar to (and in continuation of) the new concrete apron in front of the Graving Dock sill; the facing of the plastic set concrete of the lower portion of the wall with granite ashlar and rubble backing, and the re-setting when required of the granite ashlar facing of the upper part of the wall. The ashlar and rubble masonry to be set in Portland cement mortar, with not more than  $1\frac{1}{2}$  parts sand to 1 of cement. The cement, sand, and gravel in the concrete to be in the proportions of  $1 + 1\frac{1}{2} + 4\frac{1}{2}$ . In the drawing that accompanies the report, I have shown, as the mode of executing the proposed work, an extension of the inner row of sheet piling now existing, and forming part of the present dam. This row to form the inside of the dam for executing the repairing work, and the lower portions of the piles to be left in so as to form an outside protection, if required, to the apron. It is possible, however, that after further examination and conference with Mr. Smith on the spot, it may be found desirable to modify the above mode of executing the work, without altering the character or quality of the permanent work of repair, which will, I believe, render the repaired portion of the quay permanently safe and substantial, whilst other portions of the walls may be similarly treated should they hereafter require it. I estimate the cost of the repair above recommended at 900*l*.

The Maintenance of Works Committee of the Harbour Board recommend that the quay walls of the Graving Dock should be repaired as proposed by Mr. Messent in his report, and that the engineer should be authorised and instructed to carry out the work under the directions of the committee; it being understood (1) that the committee shall have power to consult with Mr. Messent during the progress of the work if deemed expedient or requisite; and (2) that the temporary dam for executing the repairs shall be constructed in line with

the outer row of sheet piling now existing and forming part of the present dam, and sheet piles driven, when required, as an outside protection to the apron.

#### DAMAGE TO PROPERTY FROM EXCAVATIONS.

THE case in which a claim is brought by Mr. H. W. Caton for damage caused to his property, 106 Blackman Street, Borough, by the excavations of the City and Southwark Subway Company on land adjoining the property, was heard at the Surrey Sessions House lately. The amount entered in the claim was 3,500*l.*, which had been afterwards reduced to 2,700*l.*

Mr. McColl and Mr. Pooley were counsel for the claimant, and Mr. Wheeler, Q.C., and Mr. Coppock for the company.

Mr. McColl explained that Mr. Caton was a veterinary surgeon, not resident at these premises, but at present the proprietor of the premises and of the business carried on in them under the style of Bussey & Co., cork manufacturers and merchants. The business had been carried on in this place for forty years or more, and it was purchased by Mr. Caton in 1880. From that time it had been carried on under the management of Mr. Bussey and Mr. Bussey's son. The premises consisted of four storeys and a basement, with a workshop at the rear. The claimant held them upon a lease of twenty-two years from 1871, at a rental of 110*l.* per annum. In the lease there were the usual covenants, one of which was to maintain the premises in good order and condition, and to deliver them up to the owner of the land at the end of the term of the lease. In consequence of the damage caused by the company's works the claimant would have to go to great expenditure in order to comply with the covenant, as he would be required to do. These buildings were newer than most of the surrounding buildings. The front premises were burnt down and rebuilt in 1860, and the back premises burnt and rebuilt in 1873 or 1874. The Subway Company was formed in 1884, with a capital of 300,000*l.*, and with power to borrow 100,000*l.* When giving the company the necessary powers, Parliament had incorporated with the Companies' Act the Land Clauses Act, and in another section had provided that the company should pay compensation to all the owners of property who were occasioned any inconvenience, loss, or damage by the exercise of the company's powers. In April 1887 the company took possession of a piece of vacant land adjoining the claimant's premises, and there a deep hole was sunk—a

huge shaft, 25 feet wide and 56 feet deep, and only 15 feet from the flank wall of the claimant's premises. There was, moreover, a cavity in excavation from the side of the shaft in the direction of the flank wall of the premises, and that excavation, he would be able to show, came almost vertically under the side wall of the house. In August 1887 the first intimation of danger was that the ground between the flank wall and this large shaft began to sink, and the large struts which were against the flank wall came away. The company at once tightened the struts, and thus, he contended, admitted their responsibility. It was expressly enacted that the company were to have power to underpin and make secure all houses within 100 feet on either side of their works, so that possible damage to property at that distance was evidently contemplated. Shortly afterwards the basement of the house became flooded, and a quantity of cork was injured; but for that the company paid, and the works went on as before. As the works proceeded, the damage became so apparent that the district surveyor gave notice that the house was moving and was dangerous, and that steps must be taken at once to shore it up and protect it. The answer of the company to the complaints of the claimant was that the works had been very carefully executed; but a company like this could not, however carefully they executed their works, injure other people's property without paying compensation. Cracks in the walls of the premises appeared and increased in number, and ultimately the claimant was summoned before the magistrate, and ordered to take the necessary steps to make the buildings safe. The magistrate, of course, had no power to make this order upon the company, who were the really responsible parties. In the course of the excavation a platform was formed and carried transversely across it in the direction of the street, so that as the platform was made the pavement in Blackman Street was found to sink. At one time it had sunk so much that the kerbstone was almost on its side, and although something had been done to make the pavement good, it was still in a very uneven state. The company suggested that the cause was certain works which the Board of Works had carried out in connection with the widening of Mint Street into Marshalsea Road, and to the excavations then made for the new sewer. The sewer was 24 feet deep. But as it approached the claimant's premises it went right over to the other side of the road, so that it was actually distant from the premises, whereas the subway excavations were only 16 feet away. Nothing was to be done to the premises except to rebuild them, and that would cost 1,700*l.*

Then there was injury to the business, rent of other premises during the rebuilding, and cost of refixing machinery. The machinery was a trade secret, and it was very important that it should not be seen or known by any one out of the business, and the least movement which occurred to its foundations rendered useless that important part of the machinery which cut the cork into thin sheets. The claimant, however, made no claim in respect of injury to the business, not because the business would not be injured, but because the disclosure of the details of his business in a public court like this would be infinitely more injurious to him than would be met by any compensation which the jury could possibly award. The heads of the claim, therefore, were:—Cost of rebuilding; rent of new premises during alterations; cost of removing and refixing machinery; general loss and inconvenience to the business; loss on forced sale of stock, if compelled to sell; loss incurred by purchasing (if enabled) from competitors to supply customers during interval of rebuilding.

Mr. Wm. Smith, architect and surveyor, of Gresham Buildings, examined by Mr. Pooley, gave evidence in general accordance with the statement of the learned counsel. He described the condition of the premises at several successive examinations which he had made. The direction of the settlements was towards the excavations of the company. There could be no doubt, he considered, that the settlements were due to the company's works, and not to the sewer of the Board of Works. The company's machinery in the excavation caused a great vibration. The tunnel ran under Blackman Street, and the house was trending in the direction of the tunnel. The transverse excavation seemed to come to just under the kerb of the paving in front of the house. He considered that the only thing to be done with the premises was to rebuild them, the cost of which would be, he estimated, 1,709*l.* 15*s.* 6*d.* The entire cubic contents of the front building was 46,061 feet, and the works behind 27,362 feet. Then there would be the other expenses, as counsel had mentioned. The machinery was beautiful, and very delicate. It would cut cork so fine that it could be printed upon like paper.

Mr. Chas. F. Hayward, district surveyor for St. Giles's and St. George's parishes, said that he had had special experience in connection with damage caused to buildings by excavations. He concurred with the evidence of the last witness.

Mr. A. Garrard, surveyor, of 60 Cannon Street, and Mr. E. B. Fuller, of 70 Queen Street, Cheapside, also gave confirmatory evidence.

Witnesses were cross-examined by Mr. Wheeler, and the inquiry was adjourned.

At the adjourned hearing further evidence was called on behalf of the claimant.

Mr. W. J. Larke (Messrs. Larke & Sons), builder and contractor, of 44 Fore Street, described the shoring of the claimant's buildings. His estimate of the cost of the rebuilding was 1,712*l.*, which would include the necessary work to secure the foundations. His rate of calculation was 9*d.* per cubic foot for the front portion, and 8*d.* for the back premises.

Mr. Charles Deering (Messrs. Deering & Sons), builder, of Islington, said that his estimate for the rebuilding was 1,690*l.*

The claimant said that he knew nothing of the condition of the premises before he purchased them in 1880.

For the company, Mr. James H. Greathead, engineer, of 8 Victoria Chambers, Westminster, said that he was engineer to the undertaking, and gave a description of the mode of carrying on the company's works in the neighbourhood of the claimant's premises, in order to show that the foundations of no house could be disturbed by the tunnelling or other excavations. He had examined the claimant's premises very carefully when the company's works were begun, and he was certain that the cracks which were visible now were visible then. The premises had been shored up before the tunnelling was commenced at all. He was informed in August 1887 that a portion of the shoring had left the building, but it was not in any way due to the works of the company. That was the first complaint which the company had received. The claimant's premises were in a very dilapidated condition. The machinery was very light, and all upon the upper floors.

Mr. W. McCleary said that he was resident engineer at the works in question. In his opinion the company's works had caused no injury to the buildings.

Cross-examined: There was no pumping going on in February 1888, when the cracks began to develop. He thought that the cracks had continued to develop since February of the present year.

Mr. Baker said that he was engineer to the Metropolitan District Railway. He was of opinion that no injury had been caused to the building by the tunnelling and other works.

Mr. A. Malcolm having given similar evidence,

Mr. James Hodson, agent to the contractor, said that photographs he had caused to be taken showed that the cracks were visible before the company's works were commenced.

Mr. A. R. Stenning, surveyor, of 121 Cannon Street; Mr.

T. Verity, of Regent Street; Mr. A. Baker (Messrs. Baker & Sons), surveyor, of Queen Victoria Street; and Mr. B. Fletcher C.C., were also examined, their evidence corroborating that given by the previous witnesses.

Mr. Wheeler, addressing the jury on behalf of the company, said that the company came into Court under protest. They submitted that they were not responsible for the subsidence, which was caused by the bad building and the "made-up" ground, the new sewer of the Metropolitan Board of Works, and by the breaking-up of the road for gas-pipes, and not from any of the company's works.

Mr. McColl, replying for the claimant, said that to speak of the subsidence as being caused by the laying down of gas-pipes was idle talk. It was impossible that such work should interfere with the foundations of a house. The claim was a moderate one. The claimant would not be adequately compensated by any amount which the jury might award.

The learned Assessor having summed up the evidence, the jury retired for consultation, and upon returning stated, through the foreman, that they found a verdict for 330*l.*, but were unable to say what part of the damage was due to the works of the Subway Company and what part to the operations of the Metropolitan Board of Works.

The learned Assessor said that he could not accept the verdict with that qualification. The jury must say absolutely what was the amount of damage done by the Subway Company.

The jury, after some discussion, retired again, and upon returning gave a verdict for 200*l.*

#### TENDERS FOR CITY LAND.

At the meeting of the Commissioners of Sewers on Tuesday, the 26th ult., a letter from the Town Clerk was read in reference to the land opposite Billingsgate Market as follows:—Referring to the letter of Mr. Architect, of the 24th ult., to the engineer of the Commissioners, embodying the resolution of the Markets Committee in reference to acquiring this land, I have now to inform you that the Markets Committee, having held a special meeting this day, have passed the following resolution, which by their instruction I forward to you, with a request that it may be laid before the Court of Sewers at its meeting on Tuesday next, viz.:—"That this committee, convinced of the public advantage of acquiring the said land for the purposes of

Billingsgate Market, and the erection of further buildings thereon, is prepared to recommend the Court of Common Council to take the land, excluding footpaths, at the valuation of the engineer of the Court of Sewers, viz., 2,430*l.* per annum, and also to pay the cost of the vaults constructed thereon, viz., 1,215*l.*, subject to the printed conditions as to peppercorn, and to a provision for purchase at an amount to be determined by an umpire, unless mutually agreed between the architect and engineer, and that the resolution of May 18 last be varied accordingly."

After a noisy discussion the proceedings were further adjourned, the members leaving the Court in confusion.

On Tuesday, the 10th inst., the debate was resumed.

The letter from the Markets Committee, laid before the last Court, stated that they were prepared to recommend the Court of Common Council to take the land at the engineer's valuation, viz., 2,430*l.* per annum, also to pay the cost of the vaults constructed thereon, viz., 1,215*l.*, subject to the printed conditions as to peppercorn, and to a provision for purchase at an amount to be determined by an umpire, unless mutually agreed between the architect and the engineer. The motion was:—"That neither of the said tenders be accepted, but that the land be offered to Colonel North for 2,430*l.* per annum"; and the amendment: "That the amended proposal of the Markets Committee be accepted."

The *City Press* gives the following report of the debate:—

Mr. Judd moved, "That as the Commission was thinly attended, the debate should be further adjourned."

Mr. Morton spoke at some length on the motion for adjournment, being several times called to order. The motion was ultimately rejected by 19 to 9.

Mr. C. T. Harris moved the adjournment of the Court, remarking that out of 27 present 20 were members of the Markets Committee.

Mr. Mathew seconded the motion in the interest of the Markets Committee.

Mr. Deputy Ashby: Do sit down.

Mr. Mathew wanted to prevent Mr. Deputy Ashby making himself ridiculous. It would be a scandal to the Commission if they continued the debate that day.

Mr. Treloar, referring to Mr. Mathew's "virtuous indignation," said for a member of the ward of Farringdon Without to be told to sit down when he wanted to stand up was ridiculous. The Commission was growing smaller by degrees and beautifully less.

MAJOLICA

MOSAIC & C.

Mr. Greenwood said those who were absent at Brixton were neglecting public business for their pleasure.

Mr. Morton said Mr. Greenwood had told him he was going to oppose the motion.

Mr. Greenwood indignantly denied the statement.

Mr. Morton: It was after dinner on the boat.

Mr. Greenwood: I have not been on board of any kind of boat or vessel.

The Chairman: You are only rising to Mr. Morton's fly.

Mr. Morton: Mr. Greenwood has quite forgotten that he went to Canvey Island with us the other day.

After an exciting scene between Alderman Sir W. Lawrence and Mr. Morton,

The Chairman charged Mr. Morton with wilfully disobeying the chair, and asked the Commission to support him.

Mr. Morton quite agreed with the chairman. If necessary they would discuss the question till ten o'clock.

Mr. Williamson said Mr. Morton's sole object was to waste time and degrade the Commission.

The motion for adjournment being negatived,

Mr. Judd proceeded to discuss the main question.

Mr. Morton said he opposed the spending of the City's cash simply to bolster up Billingsgate Market. Since the last meeting probably the truth had leaked out with regard to this matter. It appeared that the gentlemen in the market were afraid that fish shops were going to be opened by Colonel North, and the Corporation was asked to go to this enormous expense simply to buy out competition. The Corporation was asked to pay 70,000*l.* for the freehold, 1,215*l.* for the vaults, and 50,000*l.* or 60,000*l.* for building. This was not to benefit the fish trade or Billingsgate, but simply for a property speculation. The Corporation had not got the money to purchase the property.

Mr. Williamson said Mr. Morton had done nothing but oppose members of the Markets Committee and tenants of the Corporation. This action had been taken by the Markets Committee on direct instructions from the Common Council. An application was made to the Court by tenants of the Corporation.

Mr. Morton: Give the names of the tenants.

Mr. Williamson: The petition was presented by the London Fish Trade Association, including eighty-seven salesmen in the market. The Corporation was bound to provide space in the market for any *bonâ fide* fish salesman, and at the present time the space was altogether insufficient. Let Mr. Morton oppose

the report of the Markets Committee in the Court of Common Council. At the present moment the revenue of Billingsgate Market was upwards of 8,000*l.* a year, and the Corporation would be able to secure the necessary money to acquire the land. He rejected the vile insinuations of Mr. Morton, and said the Corporation was actuated solely in the interests of the public.

Mr. Morton: Read the letter.

The Clerk read the letter from the Town Clerk, as above.

The amendment agreeing to the proposal of the Markets Committee was carried by 25 to 3.

#### THE BUILDERS' ACCIDENT INSURANCE, LIMITED.

THE seventh ordinary general meeting of the above company was held at the registered offices on Thursday, the 5th instant, Mr. Stanley G. Bird in the chair. The minutes of July 29, 1887, were read and confirmed. The secretary, Mr. E. S. Henshaw, presented the reports and balance-sheets for the year ending May 31, 1888. The report and balance-sheets, as presented to the meeting, were adopted unanimously. The following five directors—Messrs. F. J. Dove, J. S. Jones, Wm. Southern, Thos. Urmson, and J. C. White (who retired from the Board under the Articles of Association)—were re-elected, and Mr. John Mowlem Burt was elected a director to fill the vacancy on the Board caused by the decease of Mr. Thomas Patrick, who was on the rota to retire this year. The usual formal resolutions having been passed, the meeting terminated with a vote of thanks to the chairman.

#### ELECTRIC APPLIANCES.

WE have pleasure in referring to some excellent improvements introduced by Messrs. P. Jolin & Co., Narrow Wine Street, Bristol. We will commence with the patent "Diamond" bell, as illustrated on next page. This bell is perfectly dustproof, so that it can be used in the dustiest factory without danger of failure, and by the device of winding the coils of the electromagnets in a double differential circuit instead of in the usual single circuit, the requisite magnetic attraction is given to the cores of the magnets without the use of a special contract pillar, and without any of the adjusting screws or platinum tips

**JAMES CARTLAND & SON, CABINET, BUILDERS, AND FURNISHING BRASSFOUNDERS, BIRMINGHAM.** LONDON SHOW-ROOMS: 40 HOLBORN VIADUCT.  
N.B.—The Show-Rooms, both in London and Birmingham, are replete with Patterns of every description of Brass Foundry. Buyers are respectfully invited to inspect same.  
**LONGBOTTOM'S PATENT ADJUSTABLE LOCK FURNITURE. MADE IN BRASS, WOOD, AND CHINA.**  
ADOPTED BY HER MAJESTY'S BOARD OF WORKS.

The attention of Architects is called to this Patent Lock Furniture as being the simplest and most reliable yet offered to the public, and whilst embracing all the features requisite in a perfect mechanical device, the total absence of defects usually found in Door Furniture still further enhances its value. In fixing insert the spindle into follower of lock, slip on rose, and screw the loose nut upon spindle until the right adjustment is obtained, then push on the other knob, the key passing through the nut and rose, turn rose half round and screw to door. They are as easily taken off as they are fixed, they cannot get out of order, and are suitable for all kinds of locks and every description of furniture.  
*Samples and Price Lists on application.*

which are to be found in the ordinary electric bells. The absence of these complications renders Jolin's patent bell simpler, less liable to get out of order, and much cheaper. The "Diamond" bell will ring either singly or in circuits, and requires fewer cells of battery than an equal number of bells working on the master-bell system.

The "Diamond" indicator is equally an improvement in its way. It differs in many respects from all self-adjusting indicators yet in the market, the pendulum action having been done away with and a balance spring substituted, thus getting rid of the very objectionable knife edges, needle points, and similar contrivances now commonly used with the pendulum. These contrivances are costly to construct, being of many parts,

and require nice adjustment: are easily damaged in transit and by rough usage, and rapidly rendered useless by dust, corrosion, and dirt. In the "Diamond" indicator these parts are entirely done away with, and a balance spring that cannot be affected by any of the above causes substituted, thus reducing the parts from several to one of a cheap kind that is absolutely certain in its action. The great freedom thus obtained by the balance spring allows of an electro-magnet of much less power being used; thus less battery current is required to work the indicator and bells, one or two cells being ample to work the "Diamond" indicator through 20 to 30 yards of ordinary electric bell-wire, sufficient for any ordinary house-work, saving by this means 20 to 40 per cent. of battery power.

Messrs. P. Jolin & Co. are also the patentees of the "Watchman's Detector," which is a system of boxes each containing an electro-magnet of peculiar construction, and a contact maker and breaker. The boxes are placed one in each place to be visited, and in the manager's room, locked up, is placed a registering instrument, driven by a clock, the man having to turn a key in each box as he goes his rounds. The

two advantages, therefore, are that the boxes are in series, thus saving wire and expense in fitting up, and that the man cannot sound the signal and register if he has not visited every box when he registers his round automatically in the manager's room. These boxes are arranged and fitted with a special device, that renders tampering with them impossible without instant detection: an important matter.

Messrs. P. Jolin & Co. are also makers and fitters of electric fire alarms, and are now extending the application of them at Stapleton Workhouse of the Bristol Incorporation of the Poor,

## THE FIRE AT THE GRAND THEATRE.

The destruction of this fine Building might have been PREVENTED by the USE of GRIFFITHS' "PYRODENE," which would have made the WHOLE of the SCENERY, STAGE, and its SURROUNDINGS—in fact, THE THEATRE in every part—ABSOLUTELY NON-INFLAMMABLE.

### GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

### GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE.

NON-POISONOUS.

ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRS.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRS.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

they being the original contractors to that Union and others. The catalogue published by this firm is a most comprehensive one, containing every information about electric appliances of all kinds, and has been most favourably reviewed in the technical journals.

#### RAYNER'S PATENT DOOR RETAINERS.

THESE retainers are the invention of Mr. George H. Rayner, of 43 Southampton Buildings, Chancery Lane, London, patent agent, and were designed to obviate the use of springs in obtaining a perfectly automatic action. This is successfully obtained, and they are now manufactured in various forms, and are about the best articles of their kind at present in the market. The construction is simple, and there is nothing to

FIG. 1.

get out of order. A catch is mounted on a plate by means of a pin, upon which it moves for a limited distance, and has a rounded nose, so that the action of the door in pressing against it opens the catch to receive the door, which is afterwards pulled round by the same movement and the door is held securely. The retainers have no springs, and are easily fixed without skilled labour. Figs. 1 and 2 are to hold swing doors open, instead of the hook and eye at present used. Fig. 1 is fixed at dado height, and fig. 2 is for fixing on floor, and is made with a broad lip, so that it may be released by the booted

foot. They are so made as to be easily adapted for either right or left hand doors, by adjusting the screw pin. To hold the door open it is simply pushed against the retainer, and is at

FIG. 2.

once securely held. Fig. 3 is a fastening to secure the first closing half of folding cupboard doors, instead of a sliding bolt. It is most effective in its action and cannot be picked

FIG. 3.

like an ordinary bolt; it is well and cheaply made. These retainers are being largely used, and, among other places, are fixed at the Horse Guards, Whitehall, London, and the War

## STEEL STRONG ROOMS, DOORS, LOCKS, AND SAFES

TO THE BANK OF ENGLAND AND ITS BRANCHES,

*Including the New Law Courts Branch now in course of Erection.*

### IMPORTANT COMMUNICATION. — WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed) WILLIAM WHITELEY.

Office have given instructions that they be fixed at the new officers' quarters and mess establishment now building at Aldershot, by Messrs. Martyn, Wells & Co., contractors. There are other forms of this invention for sashes, casements, wardrobes, &c., which we have not space here to describe or illustrate. The retainers are manufactured by Messrs. May & Padmore, of Birmingham.

### A NEW IDEA IN HOUSE BUILDING.

ACCORDING to the *Lancet*, an American physician, Dr. Gouverneur M. Smith, following in the footsteps of Dr. B. W. Richardson, has published an interesting little paper on the advantage of utilising the upper storeys and roofs of modern houses in the interests of health and recreation. After alluding to the defects of the present system of building, with its frequently dark, dusty, and overcrowded attics, he proceeds to suggest what is in several ways a better arrangement. This consists in securing free ventilation by means of shafts, in a great extension of window surface, and in providing convenient access to the roof, which is to be laid out as a pleasure garden. The roof space thus gained would form an agreeable promenade in summer, while the bright and airy upper rooms would be equally suitable for nurseries or play-rooms. Dr. Smith dwells on the amenities afforded by such a well-kept roof-garden to the dwellers in tenements. At the same time he is not forgetful of possible inconveniences arising from a promiscuous association of neighbouring tenants on this common ground; but he argues that, as a rule, the scheme is not open to any really grave objection on this account. The point is necessarily one which experience alone could settle. So far as we can learn, however, a similar principle in house-building already adopted in this country has not been discredited by any serious difficulties of the kind in question. It has always appeared to us, however, that in the event of fire the very thorough ventilation allowed by this plan of construction could not but tend to assist the conflagration. This drawback might, perhaps, be met by some specially contrived safeguard. The advocates of the project are also, doubtless, prepared to guarantee that houses constructed on this plan will not be too cold or draughty; for, unless objections like these can be satisfactorily disposed of the proposed reform is not likely to prove as useful in practice as it looks plausible on paper.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, Consulting Patent Agent, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

9466. Thomas Tucker, for an "Improved automatic sash or window fastener." June 29, 1888.

9480. Joseph Tollerton, for "Improvements in apparatus for speedy application of gas to wing lights, ground rows, and to the stages of theatres and public halls generally." June 29, 1888.

9484. Ferdinand Bosshardt, for "Improvements in bath rooms." June 29, 1888.

9515. Louis Jules Malaval, for "An improved apparatus and process for copying writing and designs of any description." June 29, 1888.

9559. Charles John Howe, for "The production of a cement or plaster suitable for rapid fireproof plastering, and for all other purposes for which Keene's and other similar cements or plasters are used, and which is capable of being produced at about the price of ordinary plaster of Paris." June 30, 1888.

9560. William Eddington, for "Improvements in mortar mills or edge runners." (Complete specification.) June 30, 1888.

9570. Thomas William Helliwell, for "An improved method or process of treating steel, iron, or any combination of such metals to prevent their oxidising, rusting, or corroding." July 2, 1888.

9591. Edward Thorp, for "Wind and water bars for meeting rails, top and bottom rails of sliding sashes, top rail and stiles of casement sashes, top rail and stiles of doors." July 2, 1888.

9594. Leon van Parys, for "Improved means for raising and lowering windows." July 2, 1888.

9612. Herbert John Haddan, for "Improvements in baths." July 2, 1888.

9615. George Henry Rayner, for "Improvements in mounting incandescent electric lamps." July 2, 1888.

8133. George Harvey, for "Improvements in stench-traps." June 4, 1888.
8199. George Withycombe, for "A self-acting flushing-tank applicable as a water-meter." June 5, 1888.
8338. Henry John Lansbury, for "An improved weather-bar for doors and windows." June 7, 1888.
8399. John Sheldon, for "Improvements in metallic framing for windows, hot-houses, conservatories, and other light structures." June 8, 1888.
8403. William George Macvitie and Isaac Whitehouse, for "Improvements in the manufacture of mounts for the handles of door-knobs, and other similar articles." June 8, 1888.
8470. Charles Young, for "Improvements in and in connection with latches." June 9, 1888.
8542. George Anderson, for "Improved method of an apparatus for raising girder, trusses, and the like members of lofty structures." June 11, 1888.
8675. Edward Bagaley Williams, for "Improvement in the construction of cast plunge-baths, and other cast baths." June 13, 1888.
8693. Charles Baker, for "Improvements in arrangements for drying slurry for the manufacture of cement." June 13, 1888.
8861. Jacob Wright, for "An improved hinge." June 16, 1888.
8960. John King, for "Improvements in flushing cisterns or water-waste preventers." June 19, 1888.
9006. Henry Berkeley, for "Improvements in a cement or plastic material for linoleum or floor covering." June 20, 1888.
9142. William Griffiths, for "Improvements for the utilisation of the flow of water in sewers and main drains of towns, and other places, for obtaining motive power." June 22, 1888.
9163. Thomas William Twyford, for "Improvements in or addition to water-closets." June 23, 1888.

## THE LONDON DRAWING OFFICE

AND ARCHITECTURAL STUDIO.

(LLOYD &amp; CO.)

ESTABLISHED 1878.

No. 37 Great James Street, Bedford Row, W.C.

City Receiving Office—50 FINSBURY SQUARE, E.C.

Cheques crossed LLOYDS, BARNETTS &amp; BOSANQUETS.

A COMPLETE ORGANISATION

For the prompt and efficient Preparation of all Work usually

required by the Architectural, Surveying, and Engineering

Professions.

Estimates by return of post.

LLOYD &amp; CO.'S PATENT AGENCY.

Information Free. Patents secured with secrecy and despatch

from £1 11s. 6d. Inventions developed, and Patents Bought.

ings, Deals, &amp;c.

BOX TUNNEL, G. W. RAILWAY (East End).  
CORSHAM DOWN QUARRY (Entrance from Railway).

## BATH FREESTONES.

We are prepared, as heretofore, to supply these sound  
and fine Building Stones on terms advantageous to Buyers.  
Orders promptly executed, and Blocks selected to suit  
all requirements.

Prices quoted by return of post, and all letters to be

addressed to

YOCKNEY &amp; CO. (Sole Owners),

CORSHAM DOWN QUARRY,

CORSHAM, WILTS.

Note.—No Connection with the other BATH

STONE FIRMS.

## COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

10950. Joseph Henry Bean & William Gaine, for "Improvements in apparatus for closing doors and preventing slamming-to of the same." August 10, 1887.

11103. Frederick William Jones, for "An improved method of fixing wood linings and the like for walls and ceilings." August 15, 1887.

11957. James Frederick Wiltshaw, for "Improvements in the mounts of door and other knobs." September 3, 1887.

11961. Benjamin Turner, for "Improvements in door springs." September 8, 1887.

12014. Griffith Brewer, for "A new or improved automatic apparatus or appliance for closing doors." September 5, 1887.

12991. William Archibald Murray, for "Improvements in gates." September 26, 1887.

194. William Fraser, for "An improved mouthpiece for speaking tubes." January 5, 1888.

8003. John Langstaffe and Henry Daniel Peckover, for "An apparatus for purifying and softening of water and preventing incrustation." June 1, 1888.

8283. William Allen, for "Improvements in fastening cords together, specially applicable for fastening endless blind and other cords which work in grooved pulleys." June 6, 1888.

## PATENTS SEALED, JUNE 6, 1888.

6256. William Kneen, for "Improvements in latches for doors and the like." April 29, 1887.

6820. William Gwinnett, for "An improved eaves plate, with or without gutter, for use with corrugated roof and wall coverings." May 10, 1887.

7036. Frank Trier, for "Improvements in stone-working machines." May 13, 1887.

8361. Henry Belcher, for "An improved machine for pressing bricks." June 10, 1887.

8756. Joseph Thomas Harris, for "Improvements in cocks, taps, valves, and other like appliances for stopping or controlling the flow or passage of water, steam, gas, or other fluid." June 17, 1887.

8849. Samuel Bastow, for "An improved door cramp." June 20, 1887.

326. Mark Henry Blanchard, for "Improvements in terra-cotta fireproof construction." January 7, 1888.

3761. Christian William Cook, for "An improved sash-holder." March 10, 1888.

## ABRIDGMENTS OF SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in spring roller-blinds." John Mitchell, No. 11010 (1887). A spring roller of the usual construction is employed; to one end thereof is adapted a pulley, one side of which is formed with ratchet teeth. Into these teeth tapes a pawl, which is suitably pivoted above the roller, and is formed with a curved extension, having at the end an eye, through which passes the blind cord. The position of the eye with regard to the pulley to which the cord is attached is such that, when the cord is lightly pulled, the pawl will be withdrawn from the ratchet, and the blind will be free to rise under the influence of the spring.

*Claim.*—*I.*—The improvements in spring roller-blinds herein shown and described, whereby one cord is made to serve to unroll the blind, unlock the catch, and regulate the speed at which the blind is to be raised as set forth.

"Improvements in connection with domestic fire-grates." T. A. Bennett, No. 6588 (1888). This invention consists of an improved arrangement of combined blower and canopy and means for adjusting and supporting the same at various heights above the grate bars. To this end a metal plate is employed with a canopy or hood formed with or attached to its lower side. This plate forms the combined blower and canopy, and is fitted in recesses or slideways formed in or attached to the cheeks of the frame on either side. The plate can be moved up and down in its slideways and adjusted at the height registered.

*Claim.*—A plate constituting a combined canopy and blower for a domestic fire-grate, said plate being supported and adjusted substantially in the manner and for the purposes herein described, and as illustrated by the annexed drawing.

"Improvements in excavators." J. H. Simpson and Saml. Porter, No. 10754 (1887).

*Claim.*—Excavators with a fulcrum adapted to be moved in a direction parallel to the longitudinal axis of the jib for the purposes set forth.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialist in Building matters. Information free.—G. H. RAYNER, Patent Agent, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

THE Leeds School Board have taken a further advantage of the competition between architects. It is known that Mr. WILLIAM LANDLESS, who quite recently held a good position as an architect in Glasgow, was compelled to accept employment as clerk of works in the Higher Grade School in Leeds at a salary of five guineas a week. His capabilities being known, and as he was supposed to have insufficient employment for all his hours, Mr. LANDLESS was directed to prepare plans for an extension of the Bewerley Street School, which was to cost about 3,000*l*. The building had been designed by Mr. CORSON. In a case of this kind, what is a stranger in Mr. LANDLESS's position to do? Is he to throw away a chance of establishing himself as an architect in England, or is he to sacrifice his prospects as an individual to the interest of the profession? While making every allowance for the difficulties before him, the majority of architects will say that Mr. LANDLESS should have taken the latter course. Having the post of clerk of works, he ought to have recognised the limitations of the duties, which in England exclude the preparation of plans. With no less reason he might have supplied plans if he belonged to the staff of a builder. Nor would his adoption of the more unselfish course do him any injury. Supposing, at the worst, Mr. LANDLESS was compelled to resign his post, may we not believe that one no less advantageous would be found for him without loss of time? As it is, he runs the risk of being reckoned as a man who will do work at a low rate; and with that sort of reputation an architect will find few people who will pay him five per cent. Indeed, it may be doubted if Mr. LANDLESS will serve his own interest with the School Board of Leeds. Already some of the members doubt the policy of paying him five guineas a week, considering that 3*l*. or 3*l*. 10*s*. is an adequate salary. It is not unreasonable to assume that when his present engagement ends he will be expected to combine the duties of architect, surveyor, and clerk of works for a much lower sum than he now receives.

MR. LANDLESS's action may have the effect of serving men who are satisfied with being recognised as clerks of works. It is often said that young architects, after their days of pupilage, could not do better than become clerks of works. But henceforth an architect will be chary of selecting anybody who might be tempted to supersede him for a post of that kind. Although Messrs. KELLY & BIRCHALL have accepted the commission for a new school in Leeds at 4 per cent., including quantities and other charges, an apology was made to the School Board when their appointment was proposed, that so much outlay was necessary because the clerk of works was sufficiently occupied with other duties. What has occurred in Leeds may be repeated elsewhere unless precautions are taken. We hope the new arrangement will be confined to Leeds, but School Boards are not indisposed to put the screw on architects.

THE venerable ANTOINE ETEX, who died this week, was prominent among French sculptors during many years. His position at one time is suggested by his selection to execute two of the large groups of the Arc de Triomphe. They are the *Resistance* and the *Peace*. One represents a young soldier going forth against the invaders, whilst a wounded man embraces his knees. Behind, a horseman falls from his horse and above is a great genius. The companion shows a warrior sheathing his sword, his companions, also, turning to peaceable pursuits. With all their merit they are not to be compared with the noble group by RUDE, which is the most admired of all parts of the structure. But PRADIER—who was the teacher of ETEX—was also unhappy in his work at the Arch. ETEX was one of those sculptors who seem to be emulous of the power of painting in expression. His big group, representing the City of Paris beseeching Heaven to stay the cholera, was more pictorial than sculptural in spirit. It was almost

too realistic in the representation of death. The work by him which is best known in England is the group of CAIN and his family, which was powerful although ungraceful.

A GENERAL meeting of the Society of Architects is to be held on Tuesday next, at St. James's Hall, when various changes in the rules will be submitted. In one it is proposed to give the Council discretion to expel any member who acts contrary to the dignity of the profession, the offender having the right to appeal to a general meeting. Recent revelations have suggested the value of such a rule. Alterations are to be made in the arrangements for election of members and associates. The form for candidate members must not only be signed by two members, but one of them must testify to his knowledge of the candidate and his works. The Council are to make further inquiries if necessary. Henceforth the entrance fee is proposed to be one guinea, and members who are a year in arrear with subscriptions can be struck off the register. As the Society of Architects has gained position, it is to be expected that admission to the Society will become more difficult than heretofore.

In the last quarterly statement of the Palestine Exploration Fund, Dr. SCHUMACHER relates the history of the new settlement on the site of the ancient Cæsarea. It appears that immigrants from Bosnia, after the Austrian occupation, fled to the Ottoman Empire, and found a refuge at Cæsarea, where extensive parcels of land were granted to them by the Sultan. This place now contains forty-five families of Bosniaks, who erected solid dwellings with tile roofs, which impart to the place quite a European aspect, entirely different from the poor huts of their fellaheen neighbours, but their roads remain in a primitive state. No general plan was observed, and frequently disputes arose amongst themselves as to the lots they occupied within the city wall, still existing from the Middle Ages. Cæsarea is a tempting field for the explorer, but the new inhabitants do not look with favour on his work, as they are afraid of foreign influence, even under the guise of archæology.

MESSRS. PETER SPENCE & Co., of Manchester, propose that, as the English law of lights is radically unjust, the various Christian Churches should set their heads together and create such public opinion in favour of commercial arbitration that no respectable firm would care to settle disputes about ancient lights, and other matters, in any other way. Messrs. SPENCE were lately defendants in an action which revealed to them the state of the law. A company of brewers occupy a public-house built across the north end or *cul de sac* of a street 36 feet wide in Manchester, the whole of their windows receiving the full uninterrupted light flowing down the street. Along the east side of this street there is a wall as high as the public-house, and forming the boundary of Messrs. SPENCE's property. Over the wall a new building was erected, and on its completion they were informed by the brewers that the light of the public-house was interrupted, and the removal of the building was demanded. Messrs. SPENCE, believing their neighbours were under a delusion, proposed that the matter should be settled amicably by arbitration, each party to choose a valuer, the two valuers to decide between them whether there was actual damage, and if so to assess its amount, an umpire being of course first jointly appointed, whose decision should be final. This was not agreed to; a trial came on, and the brewers were awarded 25*l*. paid into court, but were adjudged to pay costs on both sides. The case is only one among many in which the lawyers carry off the prize. The Christian Churches will hardly, we fear, adopt Messrs. SPENCE's suggestion, and get up an agitation for the reform of the law respecting ancient lights. But they have an alternative which seems more feasible: it is that the Manchester Chamber of Commerce, in conjunction with other Chambers, should move for the abolition of the English and the adoption of the Scottish law of lights, which allows a man at any time to erect any kind of building upon his land, unless he can be shown to have done it from malice, emulation, or other unjustifiable motive.

## SKETCHES OF ARCHITECTURE.\*

COMPLAINTS over the shortcomings of architectural education in this country are constantly heard, and in consequence the superiority of the foreign systems is supposed to be manifest. In one way we may, however, be said to excel the rest of the world, for if any advantage is to be derived from representing ancient work, the English architects may be said to have a monopoly of it. In foreign schools careful drawings of prescribed examples may occasionally be seen, but the production of them is very different to the sketching which is carried on by English students. Some may say that greater benefit is to be derived from such attempts at the reproduction of ancient buildings as are premiated in France than from filling a sketch book with bits of detail, or making picturesque views. Into that question we need not enter. What we maintain is, that the foreign student rarely repeats his experiments in reproduction, whilst in England the habit of sketching is not confined to the period of pupilage. Indeed, with some a sketch book might be supposed to be a means towards rejuvenescence.

In what other country can a series be found that is comparable to the volumes of the Association Sketch Book? French architects might be supposed to be better able to produce one or more collections of the kind, for there is, or ought to be, a sort of solidarity between the hundreds of men who issue from the schools of Paris. But although a spirit of that kind is from time to time exhibited at big dinners, it has not given rise to anything which can be considered as a memorial of the veneration for the past which the old students were supposed to imbibe in their classrooms. Here in England, where we are believed to have no systematic teaching, and where, according to some censors, we are incompetent to appreciate the true beauties of ancient architecture, we find that the Architectural Association from year to year can have the command of an unfailing supply of representations of architecture, and that the quality no less than the number is kept up. When volumes equally good can be produced by foreign architects, we shall then be convinced of the advantages of foreign processes for exciting enthusiasm for the art, but, so long as the Association Sketch Book is unique, we may console ourselves with the belief that in some things we are not inferior to our Continental friends. The last volume of the Association Sketch Book has so much spirit in its pages that it might be the first instead of the seventh of a new series. The editors and committee appear to have been more exacting in the selection of subjects, and the volume as a whole will sustain a comparison with the best of its predecessors. The title-page suggests that the volume is a sort of Jubilee record, and as such it is far superior to the majority of things on paper by which that period was commemorated.

The title-page is the work of Mr. W. G. B. LEWIS, and has that elaboration of detail which is common to all his drawings. Some of the titles in preceding volumes are no more than indications of an idea, and occasionally an ambitious one, but here the execution is perfect. In the border, arms and other emblems of Great Britain and the Colonies are introduced, and the double printing adds to the effect. The seventy-two drawings which follow are taken from England, France, Belgium, Holland, Germany and Italy. They are not all recent sketches, and some have been already published.

Mr. WOODWARD leads the way with four sketches, one being of the porch to the Abingdon almshouses, which is adorned by the remains of mural paintings. Pakenham Manor, Suffolk (Mr. GARRATT) dates from 1622, but the gables might be taken for later work. Mr. PAUL represents the Gateway of Battle Abbey in outline, and entirely in free hand. Blyburgh Church (Mr. RIX) is an interesting example of a Suffolk church, in which flint is skilfully used. Mr. T. L. WORTHINGTON gives some good Gothic detail from the Mytton Chapel in Bredon Church, and from St. Peter's Hospital, Bristol, 1607, in which good and bad detail are commingled. The three drawings of Broadwater Church, by Mr. ALFRED HART, give a clear idea of a building which contains fine wood-

work. The Pharos on St. Catherine's, Isle of Wight (Mr. MARVIN) is remarkable as an example of an early lighthouse. It appears that formerly, in addition to the tower which has survived, an oratory and hermit's cell existed. The tower is 34 feet 3 inches in height, and is 830 feet above the sea. Tranby Chapel, Cirencester, is shown in two sketches by Mr. PAUL, which give the general effect in a style that offers temptation to become careless. Elm Church, by Mr. WILSON, appears to be traced from a more elaborate drawing, but the plate shows the main features of the building. The church at Etchingham, by Mr. PAUL, suggests that he is stronger with the lead pencil than in etching, but his chancel screen from Sawbridge Church is an excellent measured drawing. Mr. F. MITCHELL supplies some work from Huddersfield, Rochdale, &c., which is not remarkable except for age. Mr. GARRATT draws the quadrangle of Ightham Mote House, which is not, however, the most interesting part of the building. His sketch of King's Sutton Manor House shows a good type of residence. Mr. BIDLAKE's view of the east transept of Lincoln Cathedral is telling, but it appears to have suffered in the transferring. Two measured drawings from the cathedral are by Mr. PITE and Mr. HOOPER. Mr. DUKE has a part of the vaulting of the Chapel of HENRY VII., a very difficult subject to represent in outline. The chest in St. Mary Overie, drawn by Mr. V. T. JONES, is curious, for the carver evidently took some building as a model. A bay of St. Bartholomew's Church, Smithfield, is drawn by Mr. SELBY in a bold line. One peculiarity noted is that the voussoirs of the triforium are only partially supported by the shafts. The view of the Priory Church, Great Malvern, is from a pencil sketch by Mr. WALTON, worked up with colour, and conveys a notion of that noble building. The pen drawing of Pershore looks flat beside it. Mr. GOTCH has a careful measured drawing of Rushton Hall, and a sheet of drawings containing many scraps from Wimborne, Salisbury, &c. The four pages of tombs from Salisbury Cathedral, by Mr. G. C. WALLACE, are excellent. The beautiful detail is rendered with a sense of its value. From Mr. A. B. MITCHELL's sketches, it might be concluded that his forte was in rendering the picturesque; but his two sheets of measured details from Tilly Church show as painstaking a spirit as could be desired. Mr. NEEDHAM WILSON has also three capital plates of the same kind from West Walton Church. Mr. NEVINSON's drawings of wood-work complete the English subjects.

Mr. OAKESHOTT has a fine drawing from the Château d'Azay le Rideau, in which birds—probably from the owner's crest—are introduced in the capitals, and again in the frieze. A panel from the staircase of the Château de Blois shows how easily a capital letter can become a subject under the hand of an artist. Mr. OAKESHOTT also furnishes a measured drawing of a part of AGNES SOREL's house in Orleans, and one of a less known but more interesting work—a loggia in a farmyard near Dieppe. It is Renaissance in style, but from the way some heads are introduced a Gothic carver might have had a share in it. Mr. MILLARD has two views of the farmhouse, which was once a grand château. Mr. MITCHELL sends two views of Laon, but, owing to the reduction, they do not appear equal to his sketches from the Palais de Justice at Rouen. Mr. RIX has done better work than his drawings of St. Pierre, Lisieux. The sheet of sketches by the late E. W. GODWIN is characteristic of his way of giving emphasis to the parts of a building which struck him as being suggestive. Another wayward artist is recalled by F. C. DESHON's sketch of Notre Dame, Senlis. It was evidently hurried in execution, but the light and shade is skilfully rendered. We published a reproduction of Mr. MARVIN's drawing of a church at Veselay when it was made, but fourteen years have not much affected the lines. In its perfect state the building represented must have been attractive, both from its design and from the quantity of sculpture that was introduced.

Belgium is represented in the Sketch Book by a copy of Mr. SPIERS's drawing of Tournai Cathedral, which appeared in an early number of this Journal. Mr. AMBLER contributes the three Dutch drawings of houses in Haarlem, Leyden, and Middelburg, the last having modern plate-glass windows and a new and commonplace door! From Germany there are four vigorous sketches by Mr. A. B. PITE, to which a weird appearance is given, and some

\* The Sketch Book of the Architectural Association for 1887.

sketches of evangelistic and other figures in needlework drawn by Mr. VACHER.

There are seventeen plates from Italy. Mr. SELBY has a rough sketch of the doorway of St. Francesco, Bologna. Mr. MARVIN has drawn four types of campanili, and Mr. E. G. HARDY shows three from Florence, drawn with great delicacy. A second drawing by Mr. HARDY is the elegant campanile of Prato Cathedral, which looks as if it could be easily transformed in a later Italian style. Mr. HORSLEY suggests the detail of the pulpit in San Miniato, Florence, which might have been made out of Classic fragments; and his skill as a figure-draughtsman is seen in two Sibyls from the Sistine Chapel, which are most difficult as tests. Mr. BIDLAKE gives detail of the ornament on the doorway of Doria's House in Genoa. The marble pavement in Siena Cathedral has inspired some drawings. Mr. A. ROBERTSON has drawn the badges of the thirteen cities which are introduced among the ornamentation, Siena having the central place. Mr. SELBY sketches part of the *Moses Striking the Rock*, which is one of the earliest parts, while Mr. LONSDALE draws parts of the borders with his habitual neatness. A plate by Mr. LONSDALE from the Capella Reale is a model of a decorative sketch in colour. Mr. DUKE gives a vigorous sketch of arching from Pisa, and Mr. LEACH has one from the Council House, which is not successful in the ornamentation.

The contents will suggest the variety and interest of the last volume of the Association Sketch Book, and, regarded as a means for the acquirement of architectural knowledge, there can be no doubt that assisting in the preparation of the work is of great importance to the contributors.

Under the satisfactory title of "Remnants of Old English Architecture,"\* Mr. T. LOCKE WORTHINGTON has produced a volume of plates from his own drawings, some French buildings, appearing as a sort of supplement. A work of this kind has the advantage of suggesting what appears most interesting in the eyes of the author, and will serve as a guide to others who may wish to go over the same ground. Mr. WORTHINGTON classes his drawings of English work in three divisions, viz., thirteenth-century, Rectilinear and "Picturesque." Under the first he gives eight plates of Wenlock Priory, which is a sort of epitome of the style. A plate from Stone Abbey exemplifies the beautiful carving, and parts of Bolton Abbey, Peterborough Cathedral and Pershore Abbey are also introduced. Manchester Cathedral is too often undervalued. The stalls which Mr. WORTHINGTON draws are richly carved, and other parts of the woodwork are not without value. A buttress from Haddon Hall illustrates the character of work of that class in the period. There are many drawings of timber houses, and we can say that all the examples are selected with fine judgment. One of the interesting features of the work is the progress which it exhibits in Mr. WORTHINGTON's own drawing. The book is adapted for the architect's library, and it is also fitted for the study of amateurs, and all who are proud of English architecture.

### THE ARMS OF BATH.

THE following is a second contribution to the *Bath Herald*, from Major Davis, F.S.A., on the heraldic question of the civic arms:—

My paper on the "Civic Arms of Bath," read before the Corporate Property Committee, has been in print for a fortnight. Within this time it has had to stand the fire of hostile critics and the decision of the Somerset Herald. The essential point of the paper, viz., the correct and authorised representation of the civic arms, has been confirmed by the Somerset Herald, and not seriously attacked by my opponents, who, by skilfully making a diversion on outlying points, which it is not necessary for me to defend, have endeavoured to raise sufficient dust to obscure the central and impregnable position on which I take my stand. Two points in my paper on which I laid no stress, and which I threw out tentatively in the shape of queries, I very gladly make a present of to the opposition. These trifles are as follows:—1. The spurious arms are noted in the College of Heralds as the unauthorised invention of an engraver. To this statement I added in brackets, with a query after it, "The Dutchman, Van Houe, I believe, 1610" (?). 2. The discarded maces in 1708, I said, "are, it is believed, those now

carried before the Mayor of Stratford-on-Avon." Neither of these points was essential to my argument, and neither of them was proclaimed with my authority, and therefore I have no compunction in throwing them both overboard.

With reference to the reply of the Somerset Herald, the only question which he was officially required to answer was, What are the authorised civic arms of Bath? And his answer is that the only arms authorised by the Heralds' College are those sanctioned in 1623. This point was fully sifted by the Corporate Property Committee in 1862, and was settled then precisely as it is now. At the present time, however, it is no secret to those who are behind the scenes, and can read between the lines, that personal feelings are mixed up with archæological and heraldic questions, which it suits the purpose of one or two restless and unrelenting gentlemen to use as a stalking-horse, under the presentation of which they may shoot their arrows; and the letter of the Somerset Herald affords strong internal evidence that he is replying, not simply to the public and official communication of the town clerk, but also to the private and unofficial communication pressed upon him at the same time by my relentless opponents, in whose interest he makes some statements which seem scarcely to rise above special pleading.

(a) The Somerset Herald, Mr. Burke, reminds me, through the town clerk, that the visitation of heralds in 1623 was not the last visitation (as I stated in the hurry of the moment), one having been held so late as 1687. I thank him for the correction, which, however, does not modify my position, as the arms authorised in 1623 were not affected by the later visitation.

(b) While allowing that the arms sanctioned in 1623 are the only authorised ones, Mr. Burke reads them heraldically slightly different from my reading. In the original visitation they are certainly to be read according to my rendering, which is also that of Mr. Planché, the Somerset Herald appealed to in 1862. In any case, however, the essential fact as to the only authorised civic arms is quite independent of any difference between Mr. Burke and myself as to the reading of them.

(c) Mr. Burke sending an emblazonment of the only authorised arms, which we will call A, encloses also two other coats of arms, which we will call B and C; and says that if A had not been allowed in 1623, he has no doubt that the College of Heralds would have sanctioned either B or C. Really, this is an extraordinary piece of reasoning, and is about as serious as if one were to say that either Lambert Simnel or Perkin Warbeck might have established his claim to the throne of Henry VII. if the rightful occupant had not maintained his seat, and if his claims had not been allowed to be superior to those of the pretenders.

(d) Lastly, Mr. Burke is of opinion that when either B or C version of the civic arms is in possession, it should not be replaced by A. It may be fairly asked whether Mr. Burke is not travelling beyond the sphere of his recognised authority in making this statement; and he is evidently not aware that the coat of arms recently removed from the Guildhall is neither B nor C, but a fourth version, which we must call D.

Having now disposed of the letter of the Somerset Herald, who confirms my position as to the only point at issue between myself and those who would endeavour to establish an authority for the conventional arms, I will now turn my attention to the defence of the spurious arms set up by local champions. The points of the defence are as follows:—The conventional arms are (1) more ancient, (2) sanctioned by usage and prescription, (3) more appropriate and significant, (4) more artistic; and I propose to deal with them seriatim.

(2) Even if we grant the fact insisted on, the antiquity of a counterfeit does not make it genuine; but though I am not called upon to argue this point, it may at least be fairly doubted whether the conventional arms have even the privilege of greater antiquity. They are said to date from 1568, but the visitation of heralds made in 1623 is thus endorsed:—"Visitation of H. St. George, Esq., Richmond Herald, and Sampson, Blewmantle, marshalls and deputies to William Camden, Esq., Clarenceaux King-of-Arms, of the south-east and west parts of the realms of Great Britain, from the river of Trent, anno domini 1623, with the visitation made anno domini 1565." Under the head of Bath is firstly a drawing of the city seal as now in use, secondly the Mayor's seal, and thirdly the civic arms as given to me by my friend Mr. Planché, when Rouge Croix Pursuivant, and beneath all this occurs the following entry:—"City incorporated by King Coel and King Edgar before the Conquest, confirmed Ed. 3 5th year of his reign, 5th Ric. 2 likewise ratified and confirmed by K. H. 5th in the 2nd year of his reign, and which confirmations were ratified and reincorporated by the late Q. Elizabeth the 4th day of September in the 32nd year of her reign . . . and at the time of this present visitation 30th day of August, 1623, was Robert Frye Maior Nicho. Hyde Recorder." The names of the remainder of the Corporation follow. The visitation of 1623 confirms all previous visitations, and any changes or grants of arms subsequent to 1528 are noted in the visitation book; so that it might be argued that all arms confirmed in 1623 with-

\* *Remnants of Old English Architecture*. By T. Locke Worthington, F.R.I.B.A. London: Sprague & Co.

out any specific date being assigned to their first grant date from "time immemorial," and not from the date of the visitation itself. Even supposing that we cannot establish the greater antiquity of the authorised arms, the advantage claimed in this respect for the conventional arms is rather damaging than otherwise to their pretensions, as the arms allowed in 1623 were authorised in the face of rivals whose very existence was an assertion of their claims, which, however, were set aside.

(2) The argument of usage and prescription in favour of the conventional coat of arms is of little value, seeing that their authority was never officially sanctioned; and there is no evading the axiom laid down in a standard book of heraldry that in "granting, conferring, or recording arms, the sole right rests with the College of Arms." ("Heraldry, Ancient and Modern," by S. T. Aveling.) The continuity of the alleged usage and prescription was broken in 1862, in a way which it is useless to ignore or minimise, as the subject was then thoroughly threshed out, and the only authorised arms were ordered to be placed on the mayor's staves. At that time Mr. Planché referred for confirmation of his views to the correct arms set up by Bishop Montague in the ceiling of the abbey previous to his translation to Winchester in 1616. These arms in the abbey are a stubborn fact which cannot be argued away by assuming "the stupidity or caprice of the artist," who, be it remembered, was Chancellor to the Garter.

(3) It is said that the conventional arms are more appropriate and significant than the authorised ones. The interpretation now offered of the spurious arms would certainly never be conjectured by the ordinary mind, as it is not at first sight evident how "bars wavy" streaming in mid-air can represent water rising within the walls, the "bars wavy" in question not being figured in the shape of columns rising from the ground, but as bands running horizontally and high above the battlements; but in the authorised coat of arms it is not difficult to understand water flowing through arches in the wall and waving at their base.

That the conventional arms are historically interesting is undoubted, but it is no part of my present purpose to account for them. I merely throw out by the way a query, offering a fruitful field of inquiry, whether they were not in the first place a trade or guild badge—in which case the "bars wavy" or "streamers" would suggest a ready interpretation; nor is it difficult to conceive how the freemen's badge might gradually usurp, without authority, the place of the civic arms.

(4) The last point brought forward in support of the unauthorised arms is their superior artistic merit. There is no arguing about tastes, and there is little necessity for me to do so, for it must be evident that the question does not enter into the case, as the authority of historical truth can never be established, even partially, by such considerations; and the matter of artistic merit has been obviously and gratuitously imported to enable a hostile critic to let off his spleen and attack me on a point not under discussion.

In 1862 the Somerset Herald was appealed to, and his decision was accepted by those who made the appeal. Twenty-six years have passed, and an official holding the same position has given the same opinion. Such a matter as this should not be left to be argued again; and the only way to set the subject at rest for ever would be to petition the College of Arms to make a new coat of arms, or to confirm under their seal the "historically true and ancient coat." I am aware that there is a sort of vested interest in the spurious arms, printers, publishers, and citizens generally having gone to considerable expense in a variety of ways to employ them on their circulars and advertisements. I have therefore to contend not only with those who are disinterestedly wedded to what they believe to be the ancient arms, but with those who find heraldry a convenient stalking-horse from behind which they can discharge their arrows, as well as with those whose property may be depreciated by the decision of the Council. Personally I have no interest in the matter beyond an earnest desire to maintain the ancient coat of arms against that which is spurious and destitute of any semblance of authority.

#### SCHOOL BUILDING IN LEEDS.

AT last week's meeting of the Leeds School Board Mr. Fawcett submitted the report of the Sites and Buildings Committee, recommending (1) the acceptance of tenders for painting and cleaning schools during the ensuing summer vacation, at a cost of 1,132*l.* 12*s.* 6*d.*; (2) the acceptance of tenders for the enlarging of Bewerley Street School, amounting to 2,991*l.* 5*s.*; and (3) the appointment of Messrs. Kelly & Birchall as architects for the Bramley School extension.—In answer to Mr. Bowling, Mr. Yates stated that the plans for the Bewerley School Street extension were prepared by Mr. Landless, the clerk of the works at the Central Higher Grade School, and the instruction was recorded in the minutes. It was quite understood when Mr. Landless was appointed clerk

of the works at the Higher Grade School, that he should render to the Board any service in his power at any time without extra remuneration. Accommodation would be provided for 360 children.—Mr. Bowling said he understood that the architect who prepared the original plans for the school was Mr. Corson, and he was surprised that anybody else should have been engaged to carry out the extension. It seemed desirable that Mr. Corson should have been allowed to undertake the enlargement, if only to preserve the architectural features of the building.—Mr. Stead thought it rather peculiar that a gentleman belonging to the party who posed as the only economists of the Board should make it the burden of his complaint that they had not needlessly thrown away 60*l.* or 100*l.* It was clearly to the interest of the Board that Mr. Landless's services should be at their disposal. During last winter the work at the Higher Grade School was stopped, and if Mr. Landless had not had the Bewerley Street School in hand he would probably have had nothing to do.—Mr. Pebody said that in the case of Mr. Landless their economy consisted in having appointed him as clerk of the works at five guineas a week, when they could have got equally competent men at a smaller sum.—Mr. Fawcett reiterated his statement that Mr. Landless had received no extra remuneration for the work.—Mr. Cockburn said that the saving which Mr. Stead had mentioned was the only offence of which their side of the Board had been guilty. He would like the public to see what a shrewd, economical member they had in Mr. Bowling.—The report was adopted.

#### ARCHÆOLOGY IN SURREY.

FOR the annual excursion of the Surrey Archæological Society, the country about Ockley and Oakwood was selected. The district is interesting, but unfortunately the weather was not favourable, and the attendance was in consequence less numerous than on former occasions. The excursion was directed by Major Heales.

At Ockley Church, Mr. Ralph Nevill, F.S.A., read a paper descriptive of the building. He said there was no mention of a church in Domesday, and indeed the mention of Ockley at all was obscure. The rector had given him a reference unearthed by Mr. O'Flahertie, of Capel, in the registers of Winchester of the date 1336, which granted a dedication of the church, and which church was stated to be "formerly founded, destroyed, and new and totally rebuilt, as we understand, from the foundations." It was evident that the church was rebuilt in time for re-dedication in 1336. Of this date was doubtless the good window on the south side—really almost the only piece of antiquity in the church. During the restoration, everything possible was saved by the care of the rector. The chancel had a brick east wall, and the porch was apparently of the sixteenth century. The tower was rather a puzzle. The tradition was that it was built to fit the bells about 1700, but it was not clear whether the four arches inside were of the same date. On the whole, he was inclined to think the arches were those of the original central tower of the church mentioned as destroyed in 1336, at which period the central tower was left at the west end. The registers are unusually early, there being a fine one of 1539, before the passing of the Act for keeping registers. Aubrey mentioned an interesting custom connected with the churchyard. "In the churchyard," he said, "are many red rose trees planted among the graves, which have been there beyond man's memory. The sweetheart, male or female, plants roses at the head of the grave of the lover deceased." Manning suggested that the custom was derived from the Romans, "who were much about here." This part of Surrey was the seat of many old families, of whom Mr. Lee Steere, of Jeyes Park, formerly M.P. for West Surrey, was perhaps the principal representative.

Major Heales, in moving a vote of thanks to Mr. Ralph Nevill, said that whilst one deprecated very much that in the restoration of ancient buildings the appearances of antiquity were spoiled, yet one could not help feeling that the house of God should receive care and decoration to make it as far as practicable worthy of Him for whom it was intended.

The adjoining Ockley Court Farm (now occupied by Colonel Calvert) was next visited. Mr. Ralph Nevill again read a paper dealing more particularly with the battle of Ockley between the Danes and Saxons. He observed that they were now upon very old ground. The ancient Stane Street, which they would see that day, still remained one of the best preserved examples in England of a Roman road. It ran in nearly a straight line direct from Colchester, the ancient Regnum, across the downs, by Bognor, with its celebrated Roman villa, by Pulborough, then hence on to Dorking. He went on to state that Dorking had been, with great plausibility, identified by Mr. Puttock with the Roman town of Dolocindum. In giving a chronological sketch of the events that seemed to have affected Surrey in the Saxon period, Mr. Nevill observed that in 805 there was a great council at "Aclea" (Ockley), attended

by Cenwulf, King of Mercia, Cuthred, the sub-king of Kent, twelve bishops, four abbots, ten "duces" (or dukes), and others. This was followed in 824 by the holding of another council, and a third in 844. At first sight it seemed strange that so out of the way a place as Ockley should be selected for such a gathering; but he pointed out that in those days it was convenient, as being on the borders of the recently-conquered kingdom of Kent, and that it was also convenient for the overlords first of Mercia and then of Wessex. Aubrey gave the site of the ancient castle, said to have been destroyed by the Danes, as near the church, and Mr. Nevill remarked that the formation of the ground around which they were now assembled bore undeniable traces of this fact. As to the site of the castle, Aubrey defined it as near the church. Bray seemed to have identified it with another site, a mile or more away, but he (Mr. Nevill) did not think that that could be accepted. The rector had told him that the tradition had it that it was on the site of the present farm buildings adjoining. One could trace the moat by the ponds and what seemed to have been a ditch, and on two sides the streams formed the natural moat. On the west side beyond the moat formed by the stream a high bank or vallum still remained, with an artificial second moat beyond it. Of course, a castle of those days was merely a mound of earth and a stockade. In building a wall there a few years ago the workmen came across a quantity of pottery, the fragments of which were preserved, including a fine and interesting vessel of the Saxon date. If the contemplated removal of the Society's museum to Guildford was carried out, he hoped there would be an extra incentive to the preservation of all such interesting memorials. Mr. Nevill alluded to the interesting remains of ancient moated enclosures around that very neighbourhood, dealing more especially with Thundersfield, which the late Mr. Godwin-Austen thought might be one of the enclosures in the woods that Cæsar described as held by the ancient Britons at the time of his invasion, and they certainly answered that description. From its peculiar position in a detached portion of the parish of Ockley, and the curious arrangement by which there were parts of seven parishes contiguous, Mr. Nevill thought it likely that the large camp on Holmbury Hill was the headquarters of Mercian power during their long supremacy in this part, and that the smaller camp on Anstiebury may have been thrown up by the Danes, and not, as sometimes thought, by the Romans. There was, however, no doubt a Roman camp on Bury Hill, Dorking, as was shown by the survival of the name "The Nower" adjoining it. Mr. Nevill next proceeded to give some particulars of the famous battle of Ockley. In 851, he said, occurred the first great Danish invasion. The Danes sailed with 350 ships into the mouth of the Thames, and burnt and plundered Canterbury, the ecclesiastical centre of England, and London, the wealthiest town. They defeated the forces of Mercia, and then marched into Surrey, doubtless on their road to Winchester and Chichester. From foreign historians, as quoted from Lappenberg, they learnt the host was part of that of "Rörik," nephew of Harold Klak, the remainder of whose host was employed in pillaging Holland. It was at Ockley that the course of the plunderers was stopped by Ethelwulf, and a fierce fight ensued. The words of the chronicle were:—"Ethelwulf and his son, Ethelbald, with the army of the West Saxons, fought against them at Ockley, and there made the greatest slaughter among the heathen army that we have heard tell of unto the present day, and there got the victory." A place called Slaughterbridge, near the Sussex boundary, has been thought to owe its name to the battle, and Mr. Nevill had found the name "Sloghterford" in a fourteenth-century deed. Wolven Lane, Wolvers, and Wolve's Hill also, doubtless, commemorate the victorious Ethelwulf. It was well that Surrey men should remember that on that spot their ancestors helped to inflict on the proud conquerors of Canterbury and London the crushing defeat that so impressed contemporary writers, and that perhaps helped to inspire the heroic deeds of Ethelwulf's son, Alfred. Who knew but that history might not repeat itself? They had heard much of late years of the battle of Dorking and of other invasions. Let them hope that the sack of London might not be repeated; but it might yet be that again in that spot the invader of England might learn to rue the day he crossed the narrow seas.

At Oakwood the hon. secretary, Dr. Milbourn, read a paper giving some very interesting information regarding the ancient chapel. In the course of his remarks he stated that very little had been found out regarding the early history of the building. It was established as a chapel-of-ease, apparently for the parishes of Abinger, Wotton, Ockley, Ewhurst, and two parishes in Sussex. Salmon attributed its foundation to Edward de la Hale, a knight of the district, who was supposed to have founded Hale House. But the building evidently dated from 1210 or 1220; and as Edward de la Hale undoubtedly died in 1430, it was clearly evident that he could not have been the original founder of the chapel. Some years back three of the bells were taken away in order to restore the building, and Mr. Evelyn, of Wotton, contributed largely towards the expense.

The Rev. Mr. Chichester produced several interesting documents, one of which was a petition drawn up and presented in the reign of Edward VI., praying for a continuance of the service at Oakwood. The Rev. Mr. Knowles (the vicar) also exhibited several interesting tracings of wall-paintings discovered during the restoration of the chapel some years ago.

The final visit of the excursion was to Capel Church.

## ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS.

THE annual meeting of this Association was concluded last week at the Institution of Civil Engineers, Westminster. Mr. E. B. Ellice-Clarke again presided. Lieutenant-Colonel Jones read a paper giving ten years' experience of what is known as the "Shone" ejector, for the lifting and propulsion of liquid or semi-liquid matter by compressed air, automatically admitted and discharged, or blown off by a machine called a pneumatic ejector. Examples were given, including instances at Eastbourne, Henley-on-Thames, and Fenton, Staffordshire, where the system was working satisfactorily. In the course of a long discussion on the paper, the opinion was generally expressed that the "Shone" injector for ordinary purposes of pumping was not equal to existing methods, on the score of either efficiency or economy. It was admitted, however, that it is useful under some exceptional circumstances, though it was strongly urged that no reliable data had been given of the actual cost of working the "Shone" system in any of the places named. Mr. de Courcey Meade, of Hornsey, read a paper describing the electrical fire-alarm arrangements adopted in that district, which he commended as highly efficient; and Mr. William Webster, F.C.S., read a paper describing the decomposition and purification of sewage by means of electricity. He passed a strong current of electricity through sewage before the meeting, and the solid matter speedily rose to the surface, leaving the fluid apparently bright. He also exhibited a sample of effluent water eight months old, and also a specimen of a disinfecting fluid obtained from sewage twelve months ago. The chief expense, he stated, was the engine power, and the process could be applied to any existing tanks. The thanks of the Association were voted to Mr. Webster for bringing before it so important a matter before he had made known his process in any other way. Several speakers considered the process likely to be productive of great results, provided it could be economically applied to the treatment of large quantities of sewage, as the analyses submitted showed the effluent water to be absolutely free from suspended matter. The members, at the close of the discussions, proceeded to visit various engineering works of interest in the metropolis.

## TESSERÆ.

The Equestrian Statue of Marcus Aurelius.

EMIL BRAUN.

MICHEL ANGELO was wont to say of this unique work of art that the horse had only to plant the raised hoof upon the ground to complete the illusion that it was a living creature. Distinguished artists have earnestly striven to emulate this unpretending, but comprehensive and fully developed, representation of historical reality, and have ended by being convinced of the impracticable nature of their undertaking. It is not enough that striking faults are avoided, nor even that the laws of beauty are observed with refinement; above all, it is important that the artistic thought should be adopted by the passive material destined to give it expression in such a manner that the two should never be at variance with each other. The decided superiority maintained by this representation of the victorious and merciful Emperor over all statues of a similar kind is mainly attributable to the simple chronicle style selected by the artist. We find no attempt made to deify his hero, but rather the resolute determination to divest him of all such properties as lend only a transitory splendour, and which therefore cannot be recognised by history. The horse appears to be the very same which, after having carried its master over the field of battle, is now, with proud and measured pace, bearing him past the captives, who have sunk down on their knees, and look up to him imploring mercy. Every motion of the noble animal has a meaning. The spirit of the master appears to have passed into the steed. The spectator feels that only the occasion is wanting to bring the strength latent in the heavy frame into instantaneous development. Marcus Aurelius, one of the noblest disciples of the Stoa, displays a sublime self-command which disposes him the more to feel sympathy with others. He raises his right hand mildly, and gives the signal of pardon to the conquered.

We feel that the beautiful quality of mercy reacts upon him who exercises it. In comparing the artistic beauties of the horse with those of the rider, the latter is so far inferior as to have given room for the opinion that they were the production of two different artists. This idea seems, however, unfounded, although it is supported by the fact that the figure has been adapted to the horse, and might easily, even now, be exchanged for another, as it admits of having been removed without leaving a single material trace of the alteration. The Emperor wears the plain mantle of a warrior. He carries no weapon nor any other token of his rank. The likeness appears to have been striking, each separate feature—nay every accidental gesture—bearing the stamp of individuality. Even his manner of sitting the horse is so characteristic that beauty has been boldly made subservient to a strict adherence to truth. For it is not to be denied that, when viewed in front, the feet of the rider are placed so far apart as to offend the eye. On the other hand, equestrians maintain that, in the absence of saddle and bridle, this manner of sitting the horse is perfectly natural. The artist has taken the liberty of placing the raised feet of the horse diagonally, which produces a good effect with regard to the stylistic arrangement of the masses, but is contrary to the truth, nay even to the laws of nature. A living horse moving in this manner would tear the antagonistic muscles, as has been proved by mechanical experiments.

#### Architecture under Francis I.

E. L'ANSON.

Although in the buildings of the time of Francis I. there is a very evident reference to the revived schools of Classical architecture, still there is no servile copy; indeed, there is no part of the decoration in particular which does not, more or less, bear a very distinct and separate character from its type. The proportions of all the mouldings of the cornices and string-courses at Blois, Fontainebleau, and Chambord are very much exaggerated, as in Prout's drawings; they are all coarse, and but rude copies of the best Italian work. There is, however, a great vigour gained by this treatment, and the peculiar cornices of Chambord and Blois, although not to be compared in elegance with Italian work of the same time, yet have a rude and massive character which gives very considerable dignity to the whole work. The projection of the pilasters is small, the arch mouldings and architrave mouldings are generally delicate and of better profile than the main cornices and string-courses, and the decoration of the capitals and carved panels is of a character often of extreme delicacy, and always of great and peculiar beauty, and there is an exuberant fancy in their varied design. The representation of foliage is perfect, and the best adapted for architectural decoration of any school of art. Ciphers and emblems, figures and animals, are sometimes introduced, but the animal carving does not equal the flowing racy vegetable form of the foliage, and at Chambord it is certainly very inferior. The buildings of this age are very much ornamented with the emblems and ciphers of their owners, a practice indeed, which, as to the ciphers, has been continued in France to our day to an extent much beyond what prevails amongst us. The F for Francis, surrounded by the Cord of Anne of Brittany, and the Salamander his emblem, and sometimes his motto "Nutrisco et Extinguo," are common on all the works of his period, whether they are Renaissance as at Blois, or Flamboyant as in the transepts at Beauvais. H for Henry, and his emblem the Crescent, also the emblem of his mistress, which he did not scruple constantly to use on the buildings of his reign. At Chambord, indeed, no opportunity seems to have been lost of displaying the royal H and the Crescent interlaced; also the two U-J connected forming H and D; and at Fontainebleau they are even used in the chapel. The Porcupine was the emblem of the ancient house of Orleans; the Ermine of the house of Brittany; une Cordelière, of Queen Anne of Brittany; and the S with a Dart through it was the emblem used for the name of the mistress of Henry IV., Gabriel d'Estrees.

#### Architectural Drawing.

SIR G. SCOTT.

The making of good pictures of our designs or buildings is no part of the fine art of architecture. It is, in fact, an art almost peculiar to our own day; but though highly conducive to the success of the individual architect, and, when well directed, a great aid to the study of architecture, it is hardly to be viewed as a very direct means of producing good architecture. To make good pictures of bad designs is obviously injurious, and renders disappointment the more certain and the more bitter; while to make good pictures of good designs may have been the beneficial effect of promoting their adoption, but still cannot be in any degree considered as of much importance to the actual result; for a well-studied design in artistic hands will be just as good when executed, if no picture at all had ever been made of it; and an ill-studied design no better for the finest drawing having been made to recommend it. This, then, it is clear, is but a secondary art—an elegant accomplishment

which becomes both useful and elevating when added to practically artistic powers—but worse than useless in their absence. Here I am happy to find Professor Cockerell's view to be as one with my own. After urging perspective drawing as essential to facility of designing, and also the necessity of cultivating the powers of the imagination, he adds:—"Having thus put before you an outline of those advantages which are to be derived from our association with the sister arts, let us be guarded against their dangerous deductions. I look upon it that all their advantages are purely linear, and not aerial or polychromatic. . . . This great error of the English school of architecture may be said to have arisen from the juxtaposition of architectural drawings in our exhibitions, to the works of the painter. . . . Colour, chiaro-oscuro, and aerial perspective are of no sort of importance (*i.e.* in architectural representations): and how entirely my opinion is supported by the best authorities and the best practice has often been laid before you. In one year in particular, I was enabled by the kindness of friends to lay before you some architectural drawings of Raphael, Michel Angelo, Sansovino, and Inigo Jones, in all of which proportion, composition, profile, and orthographic delineation were the sole end and object of their drawings, and no tricky effects of light or shade or colour were for a moment thought of or permitted. Philibert de l'Orme has humorously said, speaking of pretty drawings, 'They are hits to catch a customer, but are insufficient evidence of the substantial knowledge of the art. Be quite sure,' says he, 'that those who amuse themselves in making pretty drawings only, are those who least understand the real art and science of architecture. I do not deny,' continues he, 'that it is a graceful accomplishment in the architect to portray and paint, but his true business is with the model, and with lines only expressive of his design, its proportions, and measures.'" The power of ready and skilful sketching from actual architectural objects comes much nearer to the fine art of architecture. It is not that fine art itself, but it is one of the most direct means of attaining it. I therefore class this much higher. It must not be mistaken for the practical result aimed at; but, as a general rule, I should say that it is so necessary to it as to be its closest ally and precursor, and therefore to be cultivated with all possible diligence; but I would urge the keeping of the ultimate object always in view, viz., that sketching should be mainly followed up with the direct intention of self-culture; that the architect or student should aim in a less degree at storing his sketch-books with pleasing representations, and laying in a stock of precedents for future reference, than at the direct training of his mind and eye and hand to the conception and designing for himself of works similar in kind to those he is studying; and the kind of drawing which he should mainly aim at cultivating is that which will be the fittest means of conveying his artistic conceptions more clearly to the art-workman who will have to carry them into execution, the result being everything, the means comparatively nothing, in importance.

#### The Temple of Apollo at Delphi.

K. G. FIEDLER.

The temple of Apollo, even when we calculate value as of the present time, was enormously rich. King Croesus presented 117 blocks of gold, in thickness the breadth of a hand, six times as long and thrice as broad, each of which weighed two talents; a golden lion of ten talents; a large golden tripod, upon which the Pythia sat, with the golden statue of Apollo. Beyond this there was a cup of gold, eight talents in weight; one of silver, containing 600 amphoræ, in which the wine was mixed at the feast of the Theophania, &c. &c. In spite of the various plunderings, in the time of Pliny more than 3,000 statues remained. Strabo first describes it as poor. Pausanias saw 137 statues, works of art, and rich treasure-chambers; the latter were subterranean, round, like those of Atreus at Mycenæ; the best were those of the Sicyonians, Corinthians, and Siphnians, of whose gold mines Apollo had a tenth; those also of the Thebans and Athenians. All now is robbed, destroyed—it has disappeared, and on the holy territory of Apollo is a small poor village of frail tenements.

#### The Greek Orders.

S. SMIRKE.

Let no student suppose, in whatever amount of conscious strength he may indulge, that he can with safety trust himself to the trackless wastes of his own imagination, and shut his eyes to the lights that have been set up by long experience, or to the landmarks which the past has left for the guidance of the future. It is a false and vulgar opinion that rules are the fetters of genius. "He who begins by presuming on his own sense," says Sir Joshua, "has ended his studies as soon as he has commenced them." Now, the orders of architecture are instances of such rules of art, and have been instituted, not as fetters to embarrass, but rather as helps to strengthen, the judgment. It is no uncommon thing to hear these orders spoken of with disparagement, as tending to inculcate a servile

adherence to arbitrary rules, destructive of originality and of inventive talent. I think that this impression is founded on a misapprehension of the nature of these orders; a misapprehension, I am ready to admit, likely enough to arise from the dogmatical tone in which the proportions of the five orders are often laid down. The truth is, that the artists of ancient Greece in its best days, endowed with an unmatched perception of beauty and of the most refined cultivation, were led by their observations and experience to adopt certain general forms and proportions; and students struck with their beauty, have sought to trace it back to its original sources by an analysis of those forms and proportions; that is by their exact measurement and delineation—a very legitimate, natural and indeed necessary process. In thus deducing a system of proportions from the practice of the best architects, we are surely acting as reasonably as the student who would deduce rules of poetical composition from the poetry of Milton or of Pope. It is thus that the orders of architecture have been instituted; but it is an error to regard them as composing an infallible standard of taste, from which any deviation must be heresy. With a praiseworthy adherence to truth, the travellers who have measured and delineated these works, in giving us their transcripts of ancient examples have figured for our information minute fractions—any hair's-breadth—and thankful we should be for their laborious exactness; but it would be a gross mistake to represent that to these fractions we are to pay a superstitious reverence: this was far from the practice or intentions of the great authorities themselves. Vitruvius tells us of the diversity of practice that prevailed even in his own times. In truth, many wide diversities exist among the best examples. In the relation of the diameter to the length of the shaft of the Greek Doric order there is a difference of 33 per cent. between the heaviest and lightest examples, even in the best times. In the Ionic order a similar, though perhaps not so great, diversity prevails; and every tyro is aware also of the extreme variety in the form and character of the details existing between even pure examples of these two orders. Similar comparisons might easily be multiplied, abundantly sufficient to show that the best masters of classic times held the reins with a loose hand; indeed, under the easy sway of these five orders we recognise a regimen so mild as to satisfy any reasonable love of liberty. The value of these great examples has been not unfrequently tested and proved by the fantastic variations which have been sometimes boldly grafted upon them. In these attempts at new or amended orders we find little to encourage any wide departure from the parent forms; but, on the contrary, we recognise in them more clearly the convenience and wisdom of adhering pretty closely to known standards, which the eye has learnt to appreciate as accurately as the cultivated ear distinguishes the intervals of scientific harmony. To set at naught the architectural forms which the age of Pericles has bequeathed to us is about as idle and undiscerning a task as to condemn the rules of counterpoint, or the musical scale which has descended to us from Guido of Arezzo.

#### Oblique Mortise and Tenon.

J. ROBISON.

The joint that most of all demands the careful attention of the artist is that which connects the ends of beams, one of which pushes the other very obliquely, putting it into a state of extension. The most familiar instance of this is the foot of a rafter pressing on the tie-beam, and thereby *drawing* it away from the wall. When the direction is very oblique (in which case the extending strain is the greatest), it is difficult to give the foot of the rafter such a hold of the tie-beam as to bring many of its fibres into the proper action. There would be little difficulty if we could allow the end of the tie-beam to project to a small distance beyond the foot of the rafter; but, indeed, the dimensions which are given to tie-beams for other reasons are always sufficient to give enough of abutment when judiciously employed. Unfortunately this joint is much exposed to failure by the effects of the weather. It is much exposed, and frequently perishes by rot, or becomes so soft and friable that a very small force is sufficient either for pulling the filaments out of the tie-beam or for crushing them together. We are, therefore, obliged to secure it with particular attention, and to avail ourselves of every circumstance of construction. One is naturally disposed to give the rafter a deep hold by a long tenon; but it has been frequently observed in old roofs that such tenons break off. Frequently they are observed to tear up the wood that is above them, and push their way through the end of the tie-beam. This, in all probability, arises from the first sagging of the roof by the compression of the rafters and of the head of the king-post. The head of the rafter descends; the angle with the tie-beam is diminished by the rafter revolving round its stop in the tie-beam. By this motion the heel or inner angle of the rafter becomes a fulcrum and a very long and powerful lever, much loaded. The tenon is the other arm, very short, and being still fresh, it is therefore very powerful. It therefore forces up the wood that is above it, tearing it out

from between the cheeks of the mortise, and then pushes it along. Carpenters have therefore given up long tenons, and give to the toe of the tenon a shape which abuts firmly, in the direction of the thrust, on the solid bottom of the mortise, which is well supported on the under side by the wall-plate. This form has the further advantage of having no tendency to tear up the end of the mortise.

#### Imitative and Conventional Ornament.

J. FERGUSON.

In certain styles of art vegetable forms are employed. Among these perhaps the most beautiful and perfect ever invented was that known as the honeysuckle ornament, which the Greeks borrowed from the Assyrians, but made so peculiarly their own. It has all the conventional character of a purely lithic, with all the grace of a vegetable form, and as used with the Ionic order, is more nearly perfect than any other known. The Romans made a step further towards a more direct imitation of nature in their employment of the acanthus leaf. As applied to a capital, or where the constructive form of the bell beneath it is still distinctly seen, it is unobjectionable; but when the leaf supports the volute at the angles of the abacus, it is on the very verge of good taste. With their disregard of precedent and untrammelled wildness of imagination, the Gothic architects tried every form of vegetable ornament, from the purest conventionalism, where the vegetable form can hardly be recognised, to the most literal imitation of nature. By employing the former an architect can never sin against good taste, though he may miss many beauties; with the latter class of ornament he is always in danger of offence, and few have ever employed it without falling into mistakes. In the first place, because it is impossible to imitate perfectly foliage and flowers in stone; and secondly, because if the pliant forms of plants are made to support, or do the work of, hard stone, the incongruity is immediately apparent, and the more perfect the imitation the greater the mistake. In too many instances, even in the best Gothic architecture, the construction is so overlaid by imitative vegetable forms as to be concealed, and the work is apparently done by leaves or twigs, but in the earliest and purest style this is almost never the case. As a general rule it may be asserted that the best lithic ornaments are those which approach nearest to the grace and pliancy of plants, and that the best vegetable forms are those which most resemble the regularity and symmetry of those which are purely conventional.

#### Cast-iron Beams.

T. DAVIES.

Mr. Hodgkinson, in a paper in the "Memoirs" of the Manchester Philosophical Society, gives as the results of his experiments, that the under flange should be to the upper in the proportion of 6 : 1. His experiments having been extensive and carefully made, have ever since been considered the standard of reference, and I do not suppose that his conclusion on this subject has ever been called in question. However, having been led to examine his experiments for the purpose of condensing the results into a general law, or into a few statements that might be carried on the memory, I began to suspect that there was something wrong in the conclusion he had come to. At first I could scarcely bring myself to think that this could be the case after Mr. Hodgkinson's paper had been so long before the public, and after a considerable portion of it had been incorporated into two of the best works we have on the subject—"Barlow on the Strength of Materials" and "Fairbairn on Cast and Wrought-iron," by the authors of which the opinions contained in it have thereby been homologated. I have looked, however, over the subject again and again, to see if by any possibility there might be lurking a fallacy in my reasoning, but I can see none. The conclusion, then, on this particular point to which I have come, drawn from Mr. Hodgkinson's own experiments is, that the strongest section of beam is that with flanges from  $3\frac{1}{2} : 1$  to  $4 : 1$ , instead of  $6 : 1$ , as stated by Mr. Hodgkinson. I may indicate the nature of the oversight which, I consider, has been made by Mr. Hodgkinson. He gives the result of nine experiments on beams, with double flanges of different proportions, from which he comes to the conclusion already stated. In comparing things together, as, for instance, in the present case, the comparison of the amount of strength due to the different proportions of upper and under flanges, it is necessary to have all other things equal, or that allowance be made for any difference, and Mr. Hodgkinson has, accordingly, had these beams made of equal length and depth. He has, however, in his comparison left out of consideration the difference in the thickness of the webs.

A Papyrus of the fourteenth century before our era has been added to the British Museum. It contains certain chapters of the "Book of Death," carefully copied out by a scribe of Thebes. The illustrations are vivid.

## NOTES AND COMMENTS.

THE admiration for the works of MILLET the painter is not confined to France, and it may be said that engravings from his works are in greater demand than those from MEISSONIER'S pictures. Many strangers, and especially Americans, make it a duty to go on a pilgrimage to Barbizon, in order to see the simple house which the painter inhabited, and to contemplate the district which inspired him. An effort was lately made to preserve the house as a public building, allowing Madame MILLET to occupy it during her life. A sum of 20,000 francs was offered, which any valuer would say was a high price for the house. But the owner wants 35,000 francs, which is considered an unreasonable demand by the committee. Unless the owner becomes reasonable the house will not be purchased and is therefore likely to be demolished.

THERE was close voting in the Council Chamber of Tamworth over the proposition for the purchase of a site and the erection of municipal buildings. It was, however, carried by the casting vote of the chairman. The townspeople lately protested against the scheme, and the voting expresses the division which exists in the town. It is not surprising that some grumblers are to be found, for at present the rates are said to amount to about 6s. 8d. in the pound. If by any mismanagement an unsatisfactory design should be adopted, it will go hard with the councillors who voted in favour of the new buildings, and it therefore behoves them to take care that a safe way is adopted to insure drawings which will overcome the opposition.

A FEW French artists have been fortunate in obtaining a share in the honours which the French President awarded on the occasion of the National Fête. M. AUBÉ, the sculptor, and M. BOILEAU, the architect of the Gambetta Monument, obtained the ribbon of Chevalier of the Legion of Honour from the hand of M. CARNOT. The honour does not, however, induce all Parisians to admire their work, which is somewhat of a disappointment. Another architect, M. LALOUX, is also a chevalier. The sculptors who can henceforth wear the ribbon are MM. CORDONNIER, TURCAN, and FRANÇOIS. M. CHAPLAIN is raised to the grade of officer. Only one painter was recognised this time, viz. M. DELORT. The professors of literature obtained the lion's share of the ribbons.

AFTER all the decisions against them in respect to the tax for aiding the poor, the French artists may not have to part with any of the money received at the doors of the Salon for admission to the exhibition. The Assistance Publique Department claimed 103,000 francs, or about five-eighths of the total profit out of the exhibition, which was 160,000 francs. The expenses for the two months were 240,000 francs. The Judgment of the Council of the Prefecture now is that, the Salon exhibition being a sort of public enterprise and a national work, and as the profits do not enrich any individual speculator or company, but are bestowed on artists who are necessitous, the exhibition cannot be classed with a theatre or other place of amusement out of which owners derive profit. The Société des Artistes Français will accordingly be still considered as exempt from contributing to the funds of the public assistance unless a different decision can be obtained from another tribunal.

It is commonly known that in trees, especially exogenous, the trunk consists of a series of concentric circles, each one representing a year's growth. In all cases the circles are not readily identified. The rate of growth is not uniform, for in the early years the circles are wider, but after a time there is more regularity. It was recommended by DECANDOLLE that observations about the rate of growth should be recorded, and, if a sufficient number existed, there would be no difficulty in assuming the age of a tree from a measurement of its circumference. It would be an average of several observations. But, as a rule, measurements of the kind are not preserved, and the more importance is therefore to be attached to those which were

presented before the last meeting of the Botanic Society of Edinburgh by Dr. DAVID CHRISTISON. He kept a record of the increase of girth of the trees in the Botanic Gardens at Craigiehall from 1878 to 1888. In the case of the beeches, of which species ten specimens had been measured, the measurement of one tree, when first noted, had been 71.40 inches, while in 1887 its girth had increased to 81.75 inches, showing a total increase of 10.35 inches, and an average annual increase of 1.03 inch. In another instance the girth when first measured had been 97.30 inches, increasing in ten years to 100.40 inches—a total increase of 3.10 inches, and an average increase of 0.36 inch. Many more results were shown in tabular form. It was remarked that two disturbing elements had to be taken into account. The first was that some of the trees which had been selected for measurement had proved of too great age for the purpose in view; and the second, that during the period dealt with the winters for three successive years had been exceptionally severe. These circumstances had complicated a subject which otherwise would have been simple enough.

AT the excursion of the Shropshire Archæological Society the Rev. C. H. DRINKWATER (who was at one time an architect) described a curious inscription which was found on taking down wainscot in Llanfair Waterdine Chapel, near Clun. The inscription was on a panel measuring 34 inches by 3 inches, and was in two lines, consisting of characters that apparently are of an unique form. There are in all nearly seventy of them, containing nineteen distinct letters. Two of them have been thought to resemble the word Maria, in Greek letters. If this conjecture is correct the character for M occurs twice, that for A five times, that for R five times, and that for I seven or eight times, which would be about the proportion in any ordinary inscription for such letters. It has been thought that they are musical notes or neumes, but they do not agree with the musical notation of the eleventh century, which is probably about the date of the carving. Of other letters, P occurs twice and O three times. A more satisfactory conjecture is that they are the very rough copy, made by an illiterate workman, of bad writing, the strokes of each letter being taken separately, at an unusual distance from each other; but even then they cannot be made out, and whether they are Saxon, Welsh, or Latin cannot now be determined. The introductory character is something like what printers call an index. This is common enough in an Irish treatise usually known as the "Book of Ballymote," a vellum MS. preserved in the library of the Royal Irish Academy, Dublin. This was compiled between 1370 and 1390. It is written in ancient Irish, and several characters in it correspond to the letters of this inscription, if inscription it be.

THE meeting of the subscribers to the British School at Athens, and the Cyprus Exploration Fund, was held on Wednesday. A report was read about the progress of the work in Cyprus. Permission was first obtained to dig on a hill known as Leonfari Vouno, near Nikosia, and afterwards at the village of Kouklia, the site of the ancient Paphos. This occupied a fortnight, and led to the discovery of primitive walls and many objects belonging to an early period. At Kouklia, the famous temple of APHRODITE was completely cleared, and the ground plan carefully made out; numerous inscriptions of considerable interest were discovered, and also a few fragments of good sculpture and a large number of miscellaneous objects in pottery, glass, &c. A third excavation was carried on at Amargetti, which was successful in identifying the site of an ancient village probably called Melantha, where APOLLO was worshipped under the title OPAON. The report from Athens stated that the school had in its second session amply fulfilled the hopes of its supporters. The supply of students seemed likely to be constant; the usefulness of the school, not only to classical scholars and archæologists, but also to the artist and the architect, was becoming more widely recognised. The financial statement was not so satisfactory, for, in spite of appeals, the additional donations during last year amounted to only 110%, and the subscriptions were only increased to the extent of 7%. Further help must be insured if the operations are to be continued.

THE LAST MOMENTS OF CHARLES V.

**D**URING the first half of the sixteenth century the Emperor CHARLES V. was the most important man in Europe, and his biography would be a history of the Continent. It is supposed that he aspired to be more, and to have his supremacy recognised by kings and princes; but any ambition of that kind was not unreasonable, for his influence was felt outside his dominions. In the great soliloquy in "Hernani" VICTOR HUGO makes CHARLES express his theory of the world, and, however poetic may be the language, what is said seems to correspond with the belief of the Emperor's contemporaries. He desired to be a second CHARLEMAGNE, and Europe to be an edifice with two men at the summit, viz. the Pope and himself. The two were to be everything, and nothing was to exist on earth without their sanction, for a supreme mystery was exhibited in them. One was Truth, the other Force.

But, somehow, the world did not accept CHARLES's notions of what was best for everybody, and the ingratitude of people who were not proud to be under his feet at last made the Emperor weary. On October 25, 1555, he assembled all his magnates in Louvaine, and in their presence resigned his diadem. He reserved a pension of one hundred thousand crowns, which was to defray the cost of himself and his attendants in the monastery of Yuste. With his usual foresight he took care that his new abode was adapted to his altered condition. ROBERTSON says:—

Some months before his resignation he had sent an architect thither to add a new apartment to the monastery for his accommodation, but he gave strict orders that the style of the building should be such as suited his present situation rather than his former dignity. It consisted only of six rooms: four of them in the form of friars' cells, with naked walls; the other two, each 20 feet square, were hung with brown cloth, and furnished in the most simple manner. They were all on a level with the ground, with a door on one side into a garden, of which Charles himself had given the plan, and which he had filled with various plants, intending to cultivate them with his own hands. On the other side they communicated with the chapel of the monastery, in which he was to perform his devotions. Into this humble retreat, hardly sufficient for the comfortable accommodation of a private gentleman, did Charles enter, with twelve domestics only. He buried there, in solitude and silence, his grandeur, his ambition, together with all those vast projects which, during half a century, had alarmed and agitated Europe, filling every kingdom in it by turns with the terror of his arms and the dread of being subjected to his power.

The cloister life of CHARLES has been narrated by Sir WILLIAM MAXWELL STIRLING in a work which is likely to be esteemed as one of the classic histories. During three years the ex-Emperor led a life which was partly philosophic and partly monastic. It was, in fact, a continuous preparation for death. Services were performed almost every day as expiation for his own misdeeds or for those of his friends, and in these devotions CHARLES joined, reading out of a tattered prayer-book. At length he resolved to anticipate the days after his death by having a funeral service for himself. It was more than a rehearsal, and must have affected the gloomy spirit of CHARLES. What followed is thus described by Sir WILLIAM STIRLING MAXWELL:—

The funeral rites ended, the Emperor dined in his western alcove. He ate little, but he remained for a great part of the afternoon sitting in the open air, and basking in the sun, which, as it descended to the horizon, beat strongly upon the white walls. Feeling a violent pain in his head, he returned to his chamber and lay down. Mathisio, whom he had sent in the morning to Xarandilla to attend the Count of Oropesa in his illness, found him when he returned still suffering considerably, and attributed the pain to his having remained too long in the hot sunshine. Next morning he was somewhat better, and was able to get up to go to mass, but still felt oppressed, and complained much of thirst. He told his confessor, however, that the service of the day before had done him good. The sunshine again tempted him into his open gallery. As he sat there, he sent for a portrait of the Empress, and hung for some time, lost in thought, over the gentle face, which, with its blue eyes, auburn hair, and pensive beauty, somewhat resembled the noble countenance of that other Isabella, the great Queen of Castile. He next called for a picture of *Our Lord Praying in the Garden*, and then for a sketch of the *Last Judgment*, by Titian. Having looked his last upon the image of the wife of his youth, it seemed as if he were now bidding farewell, in the contemplation of these other favourite pictures to the noble art which he had loved with a love which cares and years and sickness could not quench, and that will ever be remembered with his better fame. Thus occupied, he remained so long abstracted and motionless, that Mathisio, who was on the watch, thought it right to awake him from his reverie. On being spoken to, he turned round

and complained that he was ill. The doctor felt his pulse, and pronounced him in a fever. Again the afternoon sun was shining over the great walnut tree full into the gallery. From this pleasant spot, filled with the fragrance of the garden and the murmur of the fountain, and bright with glimpses of the golden Vera, they carried him to the gloomy chamber of his sleepless nights, and laid him on the bed from which he was to rise no more.

The scene depicted by M. DE VRIENDT is where CHARLES looks on TITIAN's work for the last time. The artist has realised the scene with great power. But it is not surprising, for M. DE VRIENDT finds a peculiar interest in the history of CHARLES, and has painted many scenes of the eventful life of the Emperor.

ASKHAM HALL.

**W**E have already published one view of the exterior of the residence of Sir A. FAIRBAIRN, and now we give a second, which is no less picturesque in aspect. The architects of the building are Messrs. CHORLEY & CONNOR, of Leeds.

UNIVERSITY COLLEGE ARCHITECTURAL  
CLASSES.

**T**HE following prizes and certificates have been awarded in the classes of Architecture under Professor T. Roger Smith, in University College, London:—

*Fine Art.*—Donaldson Silver Medal, E. A. Runtz, of London. Certificate, 2, Alan C. Walker, of Tasmania. 3 and 2nd Prize, Harold R. Luck, of London. Second Class.—B. F. Fletcher, of London; J. W. Little, of London; P. D. Smith, of London. Third Class.—M. A. Green, of Bath; E. A. Williams, of Upper Norwood; F. E. Williams, of London.

*Construction.*—Donaldson Silver Medal, Horace Helsdon, of London. 2nd Prize, Harold R. Luck, of London. Certificates: 3, Alan C. Walker, of Tasmania. 4, Wm. D. Claridge, of London. 5, J. W. Little, of London. 6, J. Borrowman, of Godalming. Second Class.—A. W. Carne, of St. Agnes; M. A. Green, of Bath; E. C. Hanson, of London; H. C. Lander, of London. Third Class.—A. Sealy-Allin, of co. Cork; E. Finch, of Roehampton; A. G. Turner, of Anerley; E. A. Williams, of Upper Norwood; F. E. Williams, of London.

*Modern Practice.*—Prizes, equal, Gordon P. G. Hills, of London; Alan C. Walker, of Tasmania. Certificates: 3, equal, Harold R. Luck, of London; Oscar Oertel, of London. 5, E. A. Hellicar, of Bromley. Second Class.—E. A. Williams, of Upper Norwood. Third Class.—M. A. Green, of Bath; H. Lazareck, of Aldershot; W. W. Wilson, of Leytonstone.

Professor Roger Smith's prizes for drawings illustrative of the work of the classes were awarded as follows:—*Fine Art* Prize divided between E. Runtz and A. C. Walker; *Construction* Prize divided between John Borrowman and H. C. Lander.

## THE DECORATION OF HOUSES.\*

**I**N my former lecture I said decoration was purely painters' or sculptors' work, but I then referred to animal or vegetable forms. The gift of harmonising colours may belong equally to the painter and the architect.

The schemes for decoration are purely architectural, not only when they apply to buildings, but also in the case of separate articles that are movable, and that are not wholly covered with one scheme of ornament, and for this reason, that architecture deals with harmonic proportions, and with the contrast of primitive forms. We are all entranced with the sublime conception and magnificent execution of Michel Angelo's frescoes in the Sistine Chapel, but no architect can help being shocked at his utter disregard of the chapel itself; the scale of the decoration utterly destroys the size of the chapel. Whether the ornament be painted or sculptured figures, landscape, floral design, or formal ornament, the most important thing is to make the whole look well and appropriate for its purpose. One of the great arts of the decorator is to arrange his spaces harmonically, with due consideration for the use of the object, and occasionally to cure defects in the floors, walls, or

\* From the Second Cantor Lecture, by Mr. G. Aitchison, A.R.A.

ceilings of a building, when the proportions are not all that can be wished.

To take a room for example; if it be too low to admit of figures being of an adequate size to be seen, they must be excluded, and even if there be plenty of height, we do not want the figures of such gigantic size that a fine room is dwarfed into a doll's house. Certain parts of a room, too, are better seen than other parts, and it is useless to put elaborate decoration on parts that are mostly hidden by pieces of furniture, or which one must go down on one's knees to see; we do not want a floor so decorated that it looks painful to walk on, or so ornamented that we think we may trip over the things portrayed; and I may say that perhaps the very worst fault ornament can have is a look of winking at you, or being in movement.

In choosing colour, again, we should be careful to have such a tone that we can live with, for most people have their dislikes and preferences. The colour of a lady's boudoir is mostly chosen because it sets off her complexion. In a room where we work we are soon conscious of an objectionable colour which irritates instead of soothing us. Certain colours and certain tones are beneficial or prejudicial to health; very dark rooms are prejudicial, and red or yellow will also have a prejudicial effect on our health, if we have to remain in rooms of either colour all day and every day. A manufacturer had a women's workshop painted yellow, and found more than the usual sickness amongst his hands; his doctor recommended whitewash, and the normal health was restored. Growers of hyacinths have noticed a marked effect on their blowing when they are put in glasses of certain colours.

Few of us can expect to live in houses built of polished granite, porphyry, and jasper, and adorned with precious stones, but we may expect to live in those protected and embellished with enamelled terra-cotta, glass slabs, or glass mosaic, and that our streets may at least present us with a clean, gay, and cheerful appearance, even if they do not quite realise M. Charles Garnier's dream of a transformed Paris:—

I imagine the day when the tawny tones of gold will pick out the monuments and construction of our Paris; I imagine the warm and harmonious tones that will tremble under the delighted gaze. One will then have renounced those grand straight-lined streets, beautiful no doubt, but cold and unnatural as the ceremony of a noble dowager. The inflexible Commission of Ways will have its period of reaction, and, without any one being hurt, every one will be allowed to build his house without making it match those of his neighbours; the grounds of cornices will shine with eternal colours, the piers will be enriched with glittering panels, and the gilded friezes will run the whole length of the buildings, the buildings themselves will be clothed in marble and enamel, mosaic will make every one love sparkle and colour. This will not be false and petty luxury, it will be opulence, it will be sincerity. The eye, familiarised with all the marvels of tints and splendours of colour, will insist that our dress shall be modified and coloured in its turn, and the entire city will have an harmonious reflection of silk and gold. But, alas! I look around me. I see a grey and sombre sky, I see newly-painted houses, I see the shadows quite black, that wave in the interminable boulevards; I see, in short, Paris as it is! And from my artist dream I fall again into vulgar reality.

This dream is by no means impossible. I may tell you that when I was at Berlin a good many years ago, I saw a mansion that the Italians would call a palace, wholly covered with a facing of compressed tiles in patterns, the dressings of the windows and the oriels wholly composed of Minton's majolica, with a glass mosaic frieze, adorned with subjects in colour on a gold ground. I could not help saying to myself, "Here is a palace adorned with coloured materials, all but the mosaic certainly of English manufacture, but we at home have neither the taste nor wit to use them." It is true that most of our majolica leaves much to be desired in beauty of shape, in quality, tone, and arrangement of colour; but these defects could be amended if there were demand enough for skilled architects, designers, and colourists. Enamelled pottery does not do well as a rule with dull granulated surfaces. Even when new it requires a very able architect to use it properly, and in London it becomes staring, as the rough material is blackened by soot. Where granulated surfaces must be used, enamelled pottery might still be applied in very small pieces to give value to the colours of the main materials, just as nature colours a pistil, a stamen, or a spot with one complementary primary to set off another, or a secondary, or a tertiary.

There is in Oxford Street an eating or coffee-house wholly fronted with enamelled pottery that is absolutely unimpeachable, only the architect or the owner had the fear of fools upon him, and declined to give us splendour or gaiety.

If any one would start a gorgeous front of enamelled pottery there would be an outcry at first, but we should gradually get accustomed to beauty and colour, and get reconciled to the loss of dingy and blackened brick. Even now there is no outcry when the platforms of a railway station are lined with white glazed bricks banded with green or grey, and the small extra cost would soon be repaid by better health and the saving of painting. At first this could only be done by tasteful,

benevolent, and patriotic men who were wealthy, or by enterprising ones, who thought a house so fronted would advertise itself; but as this sort of facing came into fashion—as it certainly would—window jambs and reveals, panels, strings, and cornices would be kept in stock, probably printed in colours instead of hand-painted, and would be cheap enough. The gorgeous colours of the Persian tiles are now rivalled by De Morgan, who has, too, rediscovered the crimson metallic glaze of Maestro Giorgio, and he could design, paint, and burn a brick as well as a tile or a pot.

There is one use of enamelled pottery I have not mentioned, roofing tiles. In parts of France and Italy these prevail. At Lugo, in the Romagna, I saw the steeple of a church covered with enamelled pottery of different colours, which wound round it, the steeple being a cone; the visible glazed parts were semicircular in section, and though I do not know how they were fixed, they looked as if they were stuck into mortar, like the enamelled terra-cotta cones found at Babylon, and used to ornament wall surfaces. Most of the tile patterns I have seen in France are, to say the least, more ingenious than beautiful; but there are gold and green tiles used at Vienna and at Botzen that are ornamental enough, and the Chinese glazed yellow tiles seem to look well in the drawings of Chinese buildings.

Even the Romans were more alive to the use that might be made of broken glass than we are, for we learn from Martial that the collection of broken glass was a trade, and the glass, he says, was exchanged for brimstone matches. Some believe it was treated with sulphur and cast (I presume into slabs), mostly made to imitate agate, jasper, lapis-lazuli, or some precious stone, and used for pavements, wall linings, and the like. It probably was from such slabs that the glass mosaic was first chipped off. We know from Pliny the elder that glass was used by Scaurus for the decoration of one storey of his temporary theatre, and it is conjectured that this glass was the cast slabs before mentioned.

I cannot say how these glass slabs or tiles would stand our climate, but if they could be fixed in no other way, they might be set in frames of cast-iron, barfed. Many of you probably know how glass mosaic is made. Generally the colour pervades the whole thickness of the glass, the glass is cut into strips, and is then roughly chipped off into cubes; the best mosaic was chipped into very small cubes, from 3-16ths to 5-16ths of an inch square, but the commoner sort is from 3-8ths to 1-2ths; the metallic glass mosaic consists of a leaf of red, yellow, or green gold, or of silver laid on to a glass body, then covered with a thin coat of glass and the two fused together. You may see, in the Early Christian glass medallions, the gold leaf attached to the lower glass, etched into heads of holy personages, Christian stories or symbols, and then a thin coat of transparent glass fused on.

In the modern Roman gold mosaic, the body is of opaque red glass, but in the Venetian, Sicilian and Oriental varieties, the backing is of transparent glass, often of a greenish hue, which is much less hot in appearance than the other, for the gold rarely fills the whole field, and the glass beyond it shows.

The word mosaic comes from "Opus Musivum"—work of the Muses—or, as we should say, artistic work. At present the Mosaicists are very far from deserving the name of artists, or being classed with the *Maîtres Mosaistes* of George Sand. The artist who designs and colours the cartoons has to mark on his design every tessera to be used; the mechanic fits these according to the shape or colour from trays containing the different colours, and the whole is pasted on to brown paper, which is cut into short lengths, rolled up and sent here from Venice—at least, up to a late date, Venice was the seat of the manufacture both of the raw material and the finished work—then unrolled, pressed into the mortar called *mastic*, the paper washed off and the mosaic driven in with wooden mallets. If we are ever to have work of the highest excellence the mosaic worker should put his own lines on the cartoon, *i.e.*, translate it as he works it, and arrange the tints so as to get the effect the artist shows, and should be skilful enough to re-do such parts as require it in place; the exact effect can never be known until it is fixed. If the mosaic workers were good enough to do this, and were properly paid for their skill, we should soon have artists who worked wholly in mosaic, who would know how the effect wanted was to be obtained. You must recollect that in church work and in large public buildings the mosaic is generally at a great height from the eye, and more often than not, inside a dome, a half-dome, or a vault. These curved surfaces have their own lights and shades, and even at a great height the colours required are often better produced by the intermixture of tesserae of pure colour than by matching the exact colour of each tessera in the cartoon. Perhaps the most lovely coloured mosaics that exist are at St. Vitale, and in the tomb of Galla Placidia, at Ravenna, executed in the time of Justinian. That in the tomb of Galla Placidia has a blue ground like a peacock's neck, and is ornamented with gold ornament. In the half-domes of apses, where very old work exists, we are often surprised at its superiority in tone to new

work, which often looks like painting on a brass basin, and it is not until the half-dome is reached by a ladder that you find out the reason. In modern work the mastic is flush with the mosaic, but in old work very long slips of glass mosaic were used instead of the ordinary tesserae, and only held at the end by the mastic, so that there is shadow all round them. The gorgeousness of colour obtained by this material can only be judged of at Rome, Venice, and Ravenna, near home, though I believe there are still finer specimens at Constantinople, Damascus, and Jerusalem. Very ingenious parodies of pictures can be made with mosaic. If they will stand a fire they might be valuable by preserving the form, and a notion of the colour of the masterpieces of great artists. Raphael's "Transfiguration" in St. Peter's at Rome is the most celebrated of these. They were mostly used for ornamenting the gold and silver gilt covers of books, and now for ornamenting jewellery, and are said to be set in wax. When smooth they are not very effective, though when the surface is left rough they tell as colour very fairly. For internal work mosaic pictures composed of tesserae of marble or pottery answer, but wholly lack the gorgeousness of glass mosaic. Mosaic for pavements I reserve for another place.

I hardly know if I should include sgraffito. It would certainly be useless in the denser parts of London, as it would soon be a uniform dingy black; but we know that there are still examples that are visible at South Kensington, and that it lasts well in the country.

It is done in this way:—Any coloured ground that may be chosen is first prepared of mortar or cement, coloured with earthy or mineral pigments; it is then laid on the wall. White, black, yellow, red, or grey are the usual colours. On one of these grounds before it is dry about one-eighth of an inch of cement of one of the other colours is laid, the pattern is pounced on, and the parts outside the pouncing are scraped off with a modelling tool, a knife, or a bit of stick. When the whole has set, you have a picture or a pattern in two colours. This sort of work has stood in England for over twenty years when executed in the country, and in Italy the whole fronts of many large palaces have been adorned in this way, and have stood for centuries.

Public buildings built of polished marble, granite, porphyry, jasper, agate, or onyx, or faced with these, are sometimes ornamented by inlaying pictures or patterns with coloured marble or precious stones, but I do not know of any external example in England. This work is called *pietra dura*. The Taj Mahal in India is a celebrated example. There are plenty of slabs, basins, vases, paper-weights, and jewellery imported from India and Italy of *pietra dura* work.

All external work in calcareous marbles soon perishes in the atmosphere of London, whether plain or inlaid, and all incised work filled with mastic so soon gets blackened that to execute it is merely labour lost. The only other work that can be used externally is in metal. Iron rusts unless constantly painted, and almost all other metals turn black. An insurance office in the Poultry was covered with copper scales that flamed in the sun, but after a few months' exposure they became as black as ink, and what does not oxidise to blackness is covered with a black pall of soot; bronze gets nearly as black as copper, but it has of course a slight diversity of hue. Real block tin, not tinned iron, is said to stand the climate of London, but of course does not lack its pall of soot. Iron plates tinned are much used in Switzerland for the covering of steeples, but even there they get rusty. Lead takes its own blackish grey, but as it otherwise stands the climate well, I wonder it is not more used for ornamental purposes, as vases, statues, roof-crests, and the like. When I was a boy, some plumbers' shops were ornamented with leaden statues, vases, and ornamental cistern fronts. Lead is still used for ornamental roof-crests in France, often heightened by gold, black varnish, and colour. Lead is still much used for ornamental accessories in Holland—or perhaps I ought to say, was once used. I only know that there were many such when I went there in my youth; and they were much used over here during William III.'s reign. Up to a short time ago there were leaden statues and vases in the gardens of the stately mansions in Mark Lane, near the Tower of London; there are still some at Hampton Court, and they would do very well in the niches or on the pedestals of our red brick fronts, if we could not afford bronze.

It is unnecessary to speak of the ordinary freestones that weather in London, such as Portland, Chilmark, Tisbury; the sandstones, red Mansfield and Dundee, which we all know; nor brick, both cut and moulded, nor red, yellow, or grey terracotta, for all these have more or less granulated surfaces that can only be cleaned by tooling or rubbing, but plaster has never of late, as far I know, been even tried; I mean plaster of common sand and lime, or, what is still better, of lime and marble dust. Vitruvius tells us that old Roman walls covered with this material were so hard, so beautiful and so finely polished, that in his time slabs of it were cut out and used for table tops. In speaking of plaster, I did not mean compo, either Roman, Portland, or mastic, but that plaster that is made

workable for modelling, which the Italians call "gesso duro." It was once common in England; the "Peter Pindar," in Bishopsgate, is an example or was an example a few years ago, and many admirable specimens still exist in our country towns. Some of the vaulted ceilings of Hadrian's Villa, at Tivoli, now open to the air, are still adorned with it, the grace, freedom and delicacy of whose modelling we still admire, although it was done at least 1700 years ago. In few things has England declined more than in plastering, from the prevalence of casting, which allows the employment of the least skilled mechanic. Most of us have seen the magnificent ceilings of Elizabeth, James and Charles I.'s time, on whose flowers, fruit, &c., you can even now see the grain of the plasterer's hand and the holes made by his thumb to get shadow. Even in plastered ceilings of Sir W. Chambers's time, who died in 1796, you see beautiful work in high relief of fruit, flowers and foliage, and I believe the skill did not die out completely till the end of the first quarter of this century. Not twenty years ago a clerk of the works offered to reveal the secret of "gesso duro" to me if he were given the job of executing by stamps some embossed plasterwork I had to do, but the owner of the house would not go to the expense, so cast slabs were used, and the clerk of the works said the secret he had learnt from an Irish plasterer should die with him. The infinite variety that hand-stamping produces would to refined tastes be worth the expense, for cast work is all alike. In the case before mentioned, to have introduced intentional variety would have been even more costly than stamping.

Do not suppose I am finding fault with these excellent materials, Roman and Portland cement, or even mastic. All I mean is that, as yet, we have found no way of using them ornamentally in London, except as imitation of stone and stone-carving. If we had a pure atmosphere, the two first would be invaluable for inlaying, but in a very short time stone and inlay are indistinguishable from the general grime, and that too even when the inlay is black mastic.

At the Alhambra, Granada, the plasterwork seems to have been carved by hand. You still see uncarved patterns with the spacing marked out by sunk lines.

The late water-colour artist, Mr. Lundgreen, once described to me his seeing a plasterer execute an elaborate ceiling of a tomb in India by working out the pattern with a lath on the wet plaster. So extraordinary did this skill appear to him that he watched the plasterer the whole day, and at night told his dragoman that he was the cleverest artist he ever saw. The dragoman maintained that he was a very stupid fellow, and said his father was a clever fellow. He could do five patterns; he had five sons, all of whom could do three or four patterns, but this man was so stupid he could never learn but two; the artist was less surprised when he found the man had been all his life at two patterns only.

In the present day most of our internal plasterwork of any pretension is done in canvas plaster. A thin coat of fine plaster of Paris is brushed into the mould, very thin open canvas in strips is pressed into this, and brushed over with coarse stuff; the whole is then stiffened with slips of wood, attached to the backing with canvas and plaster; it is then dried in a hot room, and screwed up in its place, and can be painted on at once; its greatest merit is its lightness. The day after the late Lord Derby dined at one of the City Companies' Halls a rose out of the coffered ceiling fell down, and smashed the solid mahogany dining-table. The defects of canvas plaster are its want of flatness in the larger panels, and of straightness in the cornices.

Bronze, though it becomes a blackish green, has this advantage for the decoration of buildings, that it can be reproduced as often as you please from the modelled clay of the statuary. You may, therefore, get through its means first-rate work at a low cost, if the repetition is great, and its use may be called benevolent as well, for it does not condemn skilful men to the brainless work of constantly reproducing the same thing.

It is needless to speak of wrought-iron, which can be made into any form you like, and of any size and thickness from the stem of an anchor to a leaf, and chased or engraved, polished or lacquered, tinned or gilt. I am happy to say that wrought ironwork is receiving great attention again both from architects, painters, and ironworkers, and can be made nearly as well as it ever could. I think cast-iron has been needlessly neglected in this truly iron age. You cannot get the fineness of bronze, and you cannot chase it, but you can get really beautiful work done in it, and the wit of man can never be better employed than in using good materials at hand in the proper way, *i.e.*, by only asking them to do what they can do readily and properly. As far as I know, the only real drawback to cast-iron is its liability to rust. If Mr. Barff's process can be applied cheaply, and will resist the attacks of the atmosphere for a long time, all we have to put up with is blackness, and if the parts of a front we must have blank were filled in with glass slabs, you need have very little more black than you want. Considering how much we want light, and how dear ground is in London, it does seem very odd that cast-iron is not more used.

Cast-iron is a difficult material to use; I mean, it wants to be

calculated for its strength, it requires much thought to ornament, and everything, even to a bolt hole, has to be settled beforehand, and, except there is much repetition, it is costly. Its neglect is greatly owing to this, that no one will pay for the extra skill, time, and trouble required of the architect, so this admirable material is almost ignored. The iron statue of Epaminondas is spoken of by Pausanias, and some scholars think it was of cast-iron; at any rate Pausanias tells us "The Samian Theodorus was the first discoverer of fusing and making statues in iron," so Mr. Ruskin's diatribe against cast-iron statues seems to be uncalled for.

If people were as good judges of art and skill as they are of port wine, they would not think it extraordinary that it was paid for in the same ratio; the amateur of port who pays three guineas a bottle for it, neither envies him who drinks it at 1s. 9d. a bottle, nor thinks his wine merchant a swindler for charging him the higher price. As regards marble I cannot quite agree with M. Charles Garnier, "that even when it has lost its polish it still looks like a shabby gentleman, and is not to be mistaken for a vulgar fellow in his Sunday clothes." Except in rainy weather, when the marble is temporarily polished by the wet, its unpolished surface, in my opinion, cannot be regarded as worth the outlay; and I say this with hesitation and regret, for the exquisite harmonies produced by the decayed marble of St. Mark's was a thing to be remembered; still, as an architect, I cannot reconcile myself to using a precious material merely to give a flavour when I know that, in giving it, it is going to decay; I might, perhaps, if I were a painter. But for the inside of a building marble is the richest material you have for the production of lovely colour—music without words—painted as it is by nature's hand, with every tint and tone of delicacy and subtleness, and enlivened too by the wildest caprices of beauty.

The bar to its use in England is the damp, for when the air is full of vapour the marble condenses the moisture, which stands on it in drops or trickles down it. But as most houses and buildings are now warmed, this need not stand for much, and if we panel our rooms below with wood, there is no reason why the upper part should not be of marble. Few of us know the wealth of England in marbles, but so little is it used that it is hardly worth the quarry-owners' while to exhibit adequate specimens of their treasures. We all know the commoner sorts of Devonshire, and some of the beautiful serpentines of Cornwall. Are we equally well acquainted with the lovely Irish green, superb black, and its red; with the beautiful green of Anglesea, and the Scotch and Irish porphyries? Marbles are of every hue except blue, for blue Belge is black and white, and blue Napoleon or Imperial is but bluish-grey, and brown is scarce, though we have rosewood marble and Californian spar. Marbles are found in most countries of the world, and there are such vast varieties in Europe that they can hardly be catalogued.

During my lifetime many of the old abandoned quarries of the Romans have been rediscovered, so that Giallo antico, rosso antico, and other antique marbles have lost their preciousness in value and their epithet. The Romans had a much more pronounced taste for colour than the Greeks seem to have had, and were enthusiastic admirers of marble. There are still miles of buried marble on the banks of the Tiber, awaiting a revival of this splendid taste. It is only quite lately that any appreciation of what polished marble can do for us has revived, and there are still but few examples of the use of fine marbles in large masses. Still, fine examples may be seen in the staircases at Dorchester House and Goldsmiths' Hall, and in halls at the Holborn Restaurant and the National Gallery. The late Mr. Burges had the upper part of his dining-room lined with red Devonshire. In Italy the former passion for marble may be seen in buildings of Roman, Byzantine, Romanesque, Gothic, and Renaissance times, i.e., at Rome, Ravenna, Venice—especially at St. Mark's—at some of the churches at Genoa, at Pisa, and in the mausoleum of the Medici at Florence. Great taste in colour is requisite for the proper arrangement of coloured marbles. At present no one cares to exercise this taste as a profession, as there is so little effective demand, and in spite of the low tone of marble generally, it is much easier to make a vulgar or discordant arrangement than a strikingly good or harmonious one. The fashion of using white marble chimneypieces, white marble bas-reliefs, white marble statues and busts in decorated apartments, is absolutely fatal to low-toned schemes of colour decoration, and as a rule all gorgeous schemes of colour are low-toned, and white must then be used most sparingly as a jewel. White can only be sparingly ornamented with morsels of full colour, or very high-toned decoration must be used in conjunction with it, as this alone can sustain masses of white.

Sculptors, unhappily, have a tradition that deep red is a good background, but as green is its complementary, red makes the statues or bas-reliefs look even colder than the natural colour of white marble.

Considering the wealth of this country, which mainly goes in useless feasting, useless men and maid-servants, useless

carriages and horses, and hideous as well as useless clothes, I do not think those who will not use marble from poorness of spirit are included in the beatitudes.

As I am now on marbles, I may as well include mosaic pavements. These must be greatly restricted in so cold and damp a place as England. Few of us love to walk on a marble floor without shoes or stockings, as all would do in a warm or hot climate, but it can be used for the pavement of Protestant cathedrals, for hall floors, for the centre aisles of churches, for conservatories, porches, terraces, and the like; and when we can afford it porphyry is by far the best material for the patterns, as it only polishes by the friction of dusty boots, unlike marble, which roughens, and unpolished marble is not more attractive than stone. Plain geometrical and flat floral patterns are the best, in marble or pottery floor mosaic, for the smallness of the pieces rather helps the scale of the room or building, and does not ruin it like marble squares. The effect of a geometrical pattern in porphyry on a white marble ground, called, after Severus Alexander, *Opus Alexandrinum*, looks very splendid in the basilicas at Rome. Though, as a rule, man's work, when not too bad, must be always most pleasing to mankind, we want occasional variety, and some of the pavements composed of mere lumps of finely-coloured marbles like gigantic breccia is a pleasing contrast and change from too much of man's handiwork, and I cannot conceive any pavement of more imperial magnificence than some of those Roman floors said to have been made of lumps of lapis-lazuli.

The objection to pottery as mosaic in floors is its softness, so that it soon wears away under much traffic. Figure pictures, for a floor to be walked on, are a mistake, though they may be used as a centre-piece to be looked at from above, and be surrounded by plants or flowers; but nothing can be more appropriate for internal wall decoration than figure subjects, or floral ornament in marble or tile mosaic: in either case it is permanent, and can easily be cleaned, and that in marble, at least, must be low in tone, for it can have but two colours of complete purity, white and black.

England has got rich these last sixty years by flooding the world with rubbish, so nothing can be more patriotic than having a piece of the best workmanship you can obtain put in your house, and by that I mean attached to the freehold, if it be your own; and let this piece be adorned by the hand of an artist, for his workmanship is transcendental; and, if possible, let it portray a noble example, or evoke a noble reminiscence, and be of such materials that it cannot well be sold or destroyed for the value of the material. A modelled terracotta frieze or panel is valueless except for the art, and has the very touch of the artist's tool upon it, and if you can get a painter to make it also beautiful with colour, or have it enamelled in colour from a painter's cartoon, you will have two of the highest forms of beauty to enjoy while you live, and you will leave the best of all possible heir-looms to your children and to posterity, except a name or wisdom, courage, and integrity.

Although it is very mortifying that your landlord should steal a beautiful thing, and one probably costly as well, perhaps even destroy it, we should draw on our philosophy, and feel that it is worse still to lose the embellishment and ennobling of life; so that, if our leasehold is not very short, I think we may resign ourselves to casting our bread upon the waters.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE SECRET HISTORY OF BLENHEIM.

IN Mr. Leslie Stephen's sketch of the life of the Duke of Marlborough, published in the excellent "Dictionary of National Biography," there is a short reference to the building of Blenheim—a house which has obtained a new mistress. It is said that the Duchess quarrelled with Vanbrugh—partly for her dislike to spend money on the building, and partly because the architect acted as an agent in arranging a marriage between the granddaughter of the Duchess and the Duke of Newcastle. The relations between Vanbrugh and the Duchess of Marlborough are described in a book where a subject of the kind may seem inapposite, viz., the "Curiosities of Literature," and as Isaac Disraeli's narrative must always have interest for architects, we have thought it worth reprinting among our "Bygones":—

The secret history of this national edifice derives importance from its nature, and the remarkable characters it involved in the unparalleled transaction. The great architect when obstructed in the progress of his work by the irregular payments of the workmen, appears to have practised one of his own comic plots to put the debts on the hero himself; while

the Duke, who had it much at heart to inhabit the palace of his fame, but tutored into weariness under the vigilant and fierce eye of Atossa would neither approve nor disapprove, silently looked on in hope and in grief, from year to year, as the work proceeded, or as it was left at a stand. At length we find this *comédie larmoyante* wound up by the Duchess herself, in an attempt utterly to ruin the enraged and insulted architect.

Perhaps this is the first time that it was resolved in Parliament to raise a public monument of glory and gratitude—to an individual! The novelty of the attempt may serve as the only excuse for the loose arrangements which followed after Parliament had approved of the design, without voting any specific supply for the purpose. The Queen always issued the orders at her own expense, and commanded expedition; and while Anne lived, the expenses of the building were included in Her Majesty's debts, as belonging to the civil list sanctioned by Parliament.

When George I. came to the throne, the Parliament declared the debt to be the debt of the Queen, and the King granted a privy seal as for other debts. The Crown and the Parliament had hitherto proceeded in perfect union respecting this national edifice. However, I find that the workmen were greatly in arrears; for when George I. ascended the throne, they gladly accepted a *third* part of their several debts.

The great architect found himself amidst inextricable difficulties. With the fertile invention which amuses in his comedies, he contrived an extraordinary scheme, by which he proposed to make the Duke himself responsible for the building of Blenheim!

However much the Duke longed to see the magnificent edifice concluded, he showed the same calm intrepidity in the building of Blenheim as he had in its field of action. Aware that if he himself gave any order, or suggested any alteration, he might be involved in the expense of the building, he was never to be circumvented—never to be surprised into a spontaneous emotion of pleasure or disapprobation; on no occasion, he declares, had he even entered into conversation with the architect (though his friend) or with any one acting under his orders—about Blenheim House! Such impenetrable prudence on all sides had often blunted the subdulous ingenuity of the architect and plotter of comedies!

In the absence of the Duke, when abroad in 1705, Sir John contrived to obtain from Lord Godolphin, the friend and relative of the Duke of Marlborough, and probably his agent in some of his concerns, a warrant, constituting Vanbrugh *surveyor, with power of contracting on the behalf of the Duke of Marlborough*. How he prevailed on Lord Godolphin to get this appointment does not appear—his lordship probably conceived it was useful, and might assist in expediting the great work, the favourite object of the hero. This warrant, however, Vanbrugh kept entirely within himself; he never mentioned to the Duke that he was in possession of any such power; nor, on his return, did he claim to have it renewed.

The building proceeded with the same delays, and the payments with the same irregularity; the veteran now foresaw what happened, that he should never be the inhabitant of his own house! The public money issued from the Treasury was never to be depended on; and after 1712, the Duke took the building upon himself, for the purpose of accommodating the workmen. They had hitherto received what was called "Crown pay," which was high wages and uncertain payment—and they now gladly abated a third of their prices. But though the Duke had undertaken to pay the workmen, this could make no alteration in the claims on the Treasury. Blenheim was to be built for Marlborough, not by him; it was a monument raised by the nation to their hero, not a palace to be built by their mutual contributions.

Whether Marlborough found that his own million was slowly impairing, and the Treasury was still obdurate, or that the architect was still more and more involved, I cannot tell; but in 1715, the workmen appear to have struck, and the old delays and standstill again renewed. It was then Sir John, for the first time, produced the warrant he had extracted from Lord Godolphin, to lay before the Treasury; adding, however, a memorandum, to prevent any misconception, that the Duke was to be considered as the paymaster, the debts incurred devolving on the Crown. This part of our secret history requires more development than I am enabled to afford: as my information is drawn from "the Case" of the Duke of Marlborough in reply to Sir John's depositions, it is possible Vanbrugh may suffer more than he ought in this narration; which, however, incidentally notices his own statements.

A new scene opens! Vanbrugh not obtaining his claims from the Treasury, and the workmen becoming more clamorous, the architect suddenly turns round on the Duke, at once to charge him with the whole debt!

The pitiable history of this magnificent monument of public gratitude, from its beginnings, is given by Vanbrugh in his deposition. The great architect represents himself as being Comptroller of Her Majesty's Works; and as such was

appointed to prepare a model, which model of Blenheim House Her Majesty kept in her palace, and gave her commands to issue money according to the direction of Mr. Travers, the Queen's Surveyor-General; that the Lord Treasurer appointed Her Majesty's own officers to supervise these works; that it was upon defect of money from the Treasury that the workmen grew uneasy; that the work was stopped till further orders of money from the Treasury; that the Queen then ordered enough to secure it from winter weather; that afterwards she ordered more for payment of the workmen; that they were paid in part; and upon Sir John's telling them the Queen's resolution to grant them a further supply (*after a stop put to it by the Duchess's order*), they went on and incurred the present debt; that this was afterwards brought into the House of Commons as the debt of the Crown, not owing from the Queen to the Duke of Marlborough, but to the workmen, and this by the Queen's officers.

During the uncertain progress of the building, and while the workmen were often in deep arrears, it would seem that the architect often designed to involve the Marlboroughs in its fate and his own; he probably thought that some of their round million might bear to be chipped, to finish his great work, with which, too, their glory was so intimately connected. The famous Duchess had evidently put the Duke on the defensive; but once, perhaps, was the Duke on the point of indulging some generous architectural fancy, when lo! Atossa stepped forwards and "put a stop to the building."

When Vanbrugh at last produced the warrant of Lord Godolphin, empowering him to contract for the Duke, this instrument was utterly disclaimed by Marlborough; the Duke declares it existed without his knowledge; and that if such an instrument for a moment was to be held valid, no man would be safe, but might be ruined by the act of another!

Vanbrugh seems to have involved the intricacy of his plot, till it fell into some contradictions. The Queen he had not found difficult to manage; but after her death, when the Treasury failed in its golden source, he seems to have sat down to contrive how to make the Duke the great debtor. Vanbrugh swears that "he himself looked upon the Crown as engaged to the Duke of Marlborough for the expense; but that he believes the workmen always looked upon the Duke as their paymaster." He advances so far as to swear that he made a contract with particular workmen, which contract was not unknown to the Duke. This was not denied; but the Duke in his reply observes, that "he knew not that the workmen were employed for his account, or by his own agent"—never having heard till Sir John produced the warrant from Lord Godolphin, that Sir John was "his surveyor!" which he disclaims.

Our architect, however opposite his depositions appear, contrived to become a witness to such facts as tended to conclude the Duke to be the debtor for the building; and "in his depositions has taken as much care to have the guilt of perjury without the punishment of it, as any man could do." He so managed, though he has not sworn to contradictions, that the natural tendency of one part of his evidence presses one way, and the natural tendency of another part presses the direct contrary way. In his former memorial the main design was to disengage the Duke from the debt; in his depositions the main design was to charge the Duke with the debt. Vanbrugh, it must be confessed, exerted not less of his dramatic, than his architectural genius, in the building of Blenheim!

"The Case" concludes with an eloquent reflection, where Vanbrugh is distinguished as the man of genius, though not, in this predicament, the man of honour. "If at last the charge run into by order of the Crown must be upon the Duke, yet the infamy of it must go upon another, who was perhaps the only architect in the world capable of building such a house; and the only friend in the world capable of contriving to lay the debt upon one to whom he was so highly obliged."

There is a curious fact in the depositions of Vanbrugh, by which we might infer that the idea of Blenheim House might have originated with the Duke himself: he swears that "in 1704 the Duke met him, and told him *he* designed to build a house, and must consult him about a model, &c; but it was the Queen who ordered the present house to be built with all expedition."

The whole conduct of this national edifice was unworthy of the nation, if in truth the nation ever entered heartily into it. No specific sum had been voted in Parliament for so great an undertaking; which afterwards was the occasion of involving all the parties concerned in trouble and litigation, threatened the ruin of the architect, and I think we shall see, by Vanbrugh's letters, was finished at the sole charge, and even under the superintendence, of the Duchess herself! It may be a question whether this magnificent monument of glory did not rather originate in the spirit of party, in the urgent desire of the Queen to allay the pride and jealousies of the Marlboroughs. From the circumstance to which Vanbrugh has sworn, that the Duke had designed to have a house built by Vanbrugh, before

Blenheim had been resolved on, we may suppose that this intention of the Duke's afforded the Queen a suggestion of the national edifice.

Archdeacon Coxe, in his life of Marlborough, has obscurely alluded to the circumstances attending the building of Blenheim. "The illness of the Duke, and the tedious litigation which ensued, caused such delays that little progress was made in the work at the time of his decease. In the interim a serious misunderstanding arose between the Duchess and the architect, which forms the subject of a voluminous correspondence. Vanbrugh was in consequence removed, and the direction of the building confided to other hands, under her own immediate superintendence."

This "voluminous correspondence" would probably afford "words that burn" of the lofty insolence of Atossa, and "thoughts that breathe" of the comic wit; it might too relate, in many curious points, to the stupendous fabric itself. If her Grace condescended to criticise its parts with the frank roughness she is known to have done to the architect himself, his own defence and explanations might serve to let us into the bewildering fancies of his magical architecture. Of that self-creation for which he was so much abused in his own day as to have lost his real avocation as an architect, and condemned for posterity in the volatile bitterness of Lord Orford, nothing is left for us but to suffer our own convictions—to behold, and to be for ever astonished! But "this voluminous correspondence!" Alas! the historian of war and politics overlooks with contempt the little secret histories of art, and of human nature!—and "a voluminous correspondence" which indicates so much, and on which not a solitary idea is bestowed, petrifies our curiosity.

Of this quarrel between the famous Duchess and Vanbrugh I have only recovered several vivacious extracts from confidential letters of Vanbrugh's to Jacob Tonson. There was an equality of the genius of *invention*, as well as rancour, in her Grace and the wit; whether Atossa, like Vanbrugh, could have had the patience to have composed a comedy of five acts I will not determine; but unquestionably she could have dictated many scenes with equal spirit. We have seen Vanbrugh attempting to turn the debts incurred by the building of Blenheim on the Duke; we now learn, for the first time, that the Duchess, with equal aptitude, contrived a counterplot to turn the debts on Vanbrugh.

"I have the misfortune of losing, for I now see little hopes of ever getting it, near 2,000*l.* due to me for many years' service, plague and trouble, at Blenheim, which that wicked woman of 'Marlborough' is so far from paying me, that the Duke, being sued by some of the workmen for work done there, she has tried to turn the debt due to them upon me, for which I think she ought to be hanged."

In 1722, on occasion of the Duke's death, Vanbrugh gives an account to Tonson of the great wealth of the Marlboroughs, with a caustic touch at his illustrious victims.

"The Duke of Marlborough's treasure exceeds the most extravagant guess. The grand settlement, which it was expected her Grace had broken to pieces, stands good, and hands an immense wealth to Lord Godolphin and his successors. A round million has been moving about in loans on the land tax, &c. This the Treasury knew before he died, and this was exclusive of his 'land;' his 5,000*l.* a year upon the Post Office; his mortgages on many a distressed estate; his South Sea stock; his annuities, and which were not subscribed in, and besides what is in foreign banks; and yet this man could neither pay his workmen their bills, nor his architect his salary.

"He has given his widow (may a Scottish ensign get her!) 10,000*l.* a year to spoil Blenheim her own way; 12,000*l.* a year to keep herself clean and go to law; 2,000*l.* a year to Lord Rialton for present maintenance; and Lord Godolphin only 5,000*l.* a year jointure, if he outlives my lady: this last is a wretched article. The rest of the heap, for these are but snippings, goes to Lord Godolphin, and so on. She will have 40,000*l.* a year in present."

Atossa, as the quarrel heated and the plot thickened, with the maliciousness of Puck and the haughtiness of an Empress of Blenheim, invented the most cruel insult that ever architect endured!—so perfectly characteristic of that extraordinary woman. Vanbrugh went to Blenheim with his lady, in a company from Castle Howard, that other magnificent monument of his singular genius,

"We stayed two nights in Woodstock; but there was an order to the servants, *under her Grace's own hand, not to let me enter Blenheim!* and lest that should not mortify me enough, she having somehow learned that my wife was of the company, *sent an express the night before we came there, with orders that if she came with the Castle Howard ladies, the servants should not suffer her to see either house, gardens, or even to enter the park; so she was forced to sit all day long and keep me company at the inn!*"

This was a *coup de théâtre* in this joint comedy of Atossa and Vanbrugh! The architect of Blenheim, lifting his eyes

towards his own massive grandeur, exiled to a dull inn, and imprisoned with one who required rather to be consoled than capable of consoling the enraged architect.

In 1725, Atossa, still pursuing her hunted prey, had driven it to a spot where she flattered herself would enclose it with the security of a preservative. This produced the following explosion!

"I have been forced into chancery by that B. B. B. the Duchess of Marlborough, where she has got an injunction upon me by her friend the late good Chancellor (Earl of Macclesfield), who declared that I was never employed by the Duke, and therefore had no demand upon his estate for my services at Blenheim. Since my hands were thus tied up from trying by law to recover my arrear, I have prevailed with Sir Robert Walpole to help me in a scheme which I proposed to him, by which I got my money in spite of the hussy's teeth. My carrying this point enrages her much, and the more because it is of considerable weight in my small fortune, which she has heartily endeavoured so to destroy as to throw me into an English bastille, there to finish my days, as I began them, in a French one."

Plot for plot! and the superior claims of one of practised invention are vindicated! The writer, long accustomed to comedy-writing, has excelled the self-taught genius of Atossa. The "scheme" by which Vanbrugh's fertile invention, aided by Sir Robert Walpole, finally circumvented the avaricious, the haughty and the capricious Atossa, remains untold, unless it is alluded to by the passage in Lord Orford's "Anecdotes of Painting," where he informs us that "the Duchess quarrelled with Sir John and went to law with him; but though he proved to be in the right, or rather because he proved to be in the right, she employed Sir Christopher Wren to build the house in St. James's Park."

I have to add a curious discovery respecting Vanbrugh himself, which explains a circumstance in his life not hitherto understood.

In all the biographies of Vanbrugh, from the time of Cibber's "Lives of the Poets," the early part of the life of this man of genius remains unknown. It is said he descended from an ancient family in *Cheshire*, which came originally from *France*, though by the name, which properly written would be *Van Brugh*, he would appear to be of *Dutch* extraction. A tale is universally repeated, that Sir John once visiting France in the prosecution of his architectural studies, while taking a survey of some fortifications, excited alarm and was carried to the Bastille; where, to deepen the interest of the story, he sketched a variety of comedies, which he must have communicated to the governor, who, whispering it doubtless as an affair of State to several of the noblesse, these admirers of "sketches of comedies"—English ones no doubt—procured the release of this English Molière. This tale is further confirmed by a very odd circumstance. Sir John built at Greenwich, on a spot still called "Vanbrugh's Fields," two whimsical houses; one on the side of Greenwich Park is still called the "Bastille House," built on its model, to commemorate this imprisonment.

Not a word of this detailed story is probably true! that the *Bastille* was an object which sometimes occupied the imagination of our architect, is probable; for, by the letter we have just quoted, we discover from himself the singular incident of Vanbrugh's having been *born in the Bastille*.

Desirous, probably, of concealing his alien origin, this circumstance cast his early days into obscurity. He felt that he was a Briton in all respects but that of his singular birth. The ancestor of Vanbrugh, who was of *Cheshire*, said to be of *French* extraction, though with a *Dutch* name, married Sir Dudley Carleton's daughter. We are told he had "political connections;" and one of his "political" tours had probably occasioned his confinement in that State dungeon, where his lady was delivered of her burthen of love. The odd fancy of building a "Bastille House" at Greenwich, a fortified prison, suggested to his first life-writer the fine romance; which must now be thrown aside among those literary fictions the French distinguish by the softening and yet impudent term of "*Anecdotes hazardées*," with which formerly Varillas and his imitators furnished their pages—lies which looked like facts!

#### STRENGTH OF STONE MASONRY.\*

THE universal custom in determining the ability of stone to resist pressure is to test the compressive resistance of small cubes. The results obtained by testing small specimens of stone are very useful in determining the relative strength of different kinds of stone, but such results are of no value in determining the ultimate strength of the same stone when built into a masonry structure. The strength of a mass of masonry depends on the strength of the stone, on the size of the blocks, on the accuracy of the dressing, on the proportion of headers to stretchers, and on the strength of the mortar. A variation

\* From a paper by Professor I. O. Baker, of Illinois, in *Stone*.

in any one of these items may greatly change the strength of the masonry.

The importance of the mortar as affecting the strength of masonry to resist direct compression is generally overlooked. The mortar acts as a cushion between the blocks of stone, and if it has insufficient strength it will squeeze out laterally and cause a tensile strain; therefore, weak mortar causes the stone to fail by tension instead of by compression. Stone is several times stronger to resist compression than tension, and hence, where great strength is required it is necessary that the mortar should be of the best.

No experiments have ever been made, for obvious reasons, upon the strength of stone masonry under the conditions actually occurring in masonry structures; but experiments made upon brick piers 12 inches square and from 2 to 10 feet high, laid in mortar composed of one volume Portland cement and two sand, show that the strength per square inch of the masonry is only about one-sixth of the strength of the brick. An increase of 50 per cent. in the strength of the brick produced no appreciable effect on the strength of the masonry; but the substitution of cement mortar (1 part Portland cement and 2 parts sand) for lime mortar (1 part lime and 3 parts sand), increased the strength of the masonry 70 per cent. The method of failure of these piers indicates that the mortar squeezed out of the joints and caused the brick to fail by tension. Since the mortar is the weakest element, the less mortar used the stronger the wall; therefore the thinner the joints and the larger the blocks, the stronger the masonry provided the surfaces of the stone do not come in contact.

It is generally stated that the working strain on stone masonry should not exceed one-twentieth to one-tenth of the strength of the stone; but it is clear, from the experiments on brick piers referred to above, that the strength of the masonry depends on the strength of the stone only in a remote degree.

In a general way, it may be said that the results obtained by testing small cubes may vary 50 per cent. from each other, or say 25 per cent. from the mean, owing to undetected differences in the material, cutting, and manner of applying the pressure; and also that stones crack at half of their ultimate crushing strength. Hence, when the greatest care possible is exercised in selecting and bedding the stone, the safe working strength of the stone alone should not be regarded as more than one-fourth to three-eighths of the ultimate strength. A further allowance, depending upon the kind of structure, the quality of mortar, the closeness of the joints, &c., should be made to secure safety. Experiments upon comparatively large specimens are but little help in deciding this question; the only way is to determine the load carried by actual structures. The following are the greatest loads carried by stone masonry that were discovered by an extended search through engineering literature.

Early builders used much more massive masonry, proportional to the load to be carried, than is customary at present. Experience and experiments have shown that such great strength is unnecessary. The load on the monolithic piers supporting the large churches in Europe does not exceed 30 tons per square foot (420 pounds per square inch), or about one-thirtieth of the ultimate strength of the stone alone. The stone-arch bridge of 140 feet span at Pont-y-tu-Prydd, over the Toff, in France, erected in 1750, is supposed to have a pressure of 20.7 tons per square foot (290 pounds per square inch) on hard limestone rubble masonry laid in lime mortar. A former bridge at the same place failed with 64 tons per square foot. Rennie subjected good hard limestone rubble in columns 4 feet square to 22 tons per square foot (300 pounds per square inch). The granite piers of the Saltash bridge (England) sustain a pressure of 9 tons per square foot (125 pounds per square inch).

The maximum pressure on the granite masonry of the Brooklyn Bridge is about 28½ tons per square foot (about 400 pounds per square inch); the maximum pressure on the limestone masonry is about 10 tons per square foot (125 pounds per square inch). The face stones ranged in cubical contents from 1½ to 5 cubic yards; the stones of the granite backing averaged about 1½ cubic yards, and of the limestone about 1½ cubic yards per pier. The mortar was 1 volume of Rosendale cement and 2 of sand. The stones were rough axed or pointed to ½-inch bed-joints, and ½-inch vertical face-joints. These towers are very fine examples of the mason's art.

The pressure on the limestone piers of the St. Louis Bridge was, before completion, 38 tons (527 pounds); after completion the pressure was 19 tons (273 pounds) on the piers, and 15 tons (198 pounds) on the abutments. The limestone masonry in the towers of the Niagara Suspension Bridge failed under 36 tons per square foot, and were taken down; however, the masonry was not executed.

At the South Street Bridge, Philadelphia, the pressure on the rubble masonry in the pneumatic piles is 15.7 tons per square foot (220 pounds) at the bottom, and 12 tons at the top; this is unusually heavy, but there are no signs of weakness. The maximum pressure on the rubble masonry and cement mortar of some of the large masonry dams is from 11 to 14

tons per square foot. The proposed Quaker Bridge dam, which is to impound water for New York City, and which is the largest in the world, is designed for a maximum pressure of 16 tons per square foot on massive rubble masonry in best hydraulic cement mortar.

#### GERMAN COMMERCIAL MUSEUMS.

THE British Consul, M. Oppenheimer (Frankfort), reporting upon the trade of Frankfort in the year 1887, notices changes for the better in several branches, but continued complaint of over-production. He says:—"Great care is taken by all German Chambers of Commerce to acquaint the German commercial world with everything connected with export trade; they are indefatigable in giving advice and hints how to make the most profit out of existing relations, and how to enter into new ones. The export museums existing in most of the principal cities of Germany, and which are looked upon with growing interest, greatly contribute to extend the intercourse with foreign countries. The Frankfort Export Museum, fitted up in the galleries of the New Exchange Buildings, principally serves to inform the manufacturers and merchants of this district regarding the mode of business in foreign parts, and to facilitate transactions with foreign consumers by exhibiting in all their various qualities the articles most current in transoceanic countries, stating the prices that were realised there, the mode of packing most in favour, the quantities sold, the local charges, the period for which credit is asked and allowed, and so on. Thus the German manufacturer is enabled to see whether he can compete in exporting these articles to foreign markets, and also to adapt his goods to the wants of the country to which they are intended to be exported. The other part of the collection, the Museum of Imports, is equally important. . . . An information office constitutes the third part of the museum. The aim of this office is to afford all possible information concerning foreign countries. It contains statistics of every description, technical and commercial periodicals, guides and directories, reports and custom tariffs not included in German trade records. Parties interested are thus afforded an opportunity of keeping themselves always promptly informed on the subject of imports and exports. The museum is under the patronage of the German Government, and constantly receives through the German consulates interesting articles and collections of samples. The export sample-rooms of this city answer a similar purpose. The object of this institution is to promote the export and shipping of German merchandise. It exhibits samples, designs, sketches, advertisements, showcards, price-lists, and so on, for industrial and other producers, giving the exact prices, measures, weights, and all the required details in German, French, and English. Similar institutions exist in Stuttgart, Berlin, Munich, Cologne, and other German cities.

#### The Revival of Architecture.

SIR,—It would naturally be expected that an academical Professor would take broad views upon architectural style, at least in his public utterances, whatever his private sympathies—which like every one else he must have—may be. Still more might it be expected that he would take care to be historically correct. Mr. George Aitchison publishes his views on the above subject in one of your contemporary journals, and it appears to me that the paper bristles with questionable statements. But to take only one: "The merits of Gothic are many—you may call it picturesque, quaint, original, wonderful, daring, mysterious, vigorous, sometimes even sublime." This is pretty good. The most ardent admirers of Gothic architecture could scarcely desire warmer acknowledgment. He, however, goes on: "But if beauty means perfect proportion, with perfect grace of form, to call it beautiful is to use language in the same loose way as people who call a tender leg of mutton beautiful." So, in his opinion, the style that he admits possessed all the above characteristics, yet, nevertheless, produced no example of the beautiful. Shades of Jocelyn de Coucy, Monterey, and De Braye preserve us! He continues: "It was mainly from the lack of this quality—the beautiful—that it perished at the touch of the Renaissance." That is, according to the learned and genial professor, Renaissance architecture possessed all the above qualities, and many more, and consequently was such a power in art that the older glories perished accordingly—the new splendours were all too much for them. I deny this *in toto*. Renaissance architecture had nothing to do with the perishing of Gothic architecture. The change of style had nothing to do with the superior characteristics or the greater beauty of one style or the other. Something much more

powerful was at work in those days than architecture, viz. the complete change of social, political, and religious institutions. In this change, the cataclysm of nations, the Freemasons who had covered the earth with such beautiful and magnificent structures perished with all their arts and science, which none were then acquainted with but themselves. A sacred secrecy was part of their system. For a time architecture suffered grievously, clothing itself in a mere jumble of ancient classical forms, destitute at once of the skill of the Gothic and the grace of the antique. It was a weak infant in those days—not the powerful giant the Professor would have us believe; and I make bold to say that so long as our professors are content with “imitative” architecture, it will be some time before a Renaissance of any merit will “reveal itself, like Satan, at the touch of Ithuriel’s spear.” Something less magical, but more powerful, will be required. Two things will be necessary before we can have “an epoch of perfect architecture”—a national architecture worthy of the name—(1) a period of comparative mental quiet, when many social, religious, and political questions which at present excite men’s minds shall have been settled; and (2) a higher educational status in the general public and in the profession. On these conditions great works are sure to appear. There will be men with adequate accomplishments and genius in architectural design and construction, and there will be a nation to appreciate and encourage their works. Then we shall have our architectural epoch; then, like Pallas springing fully armed from the brain of Zeus, architecture—mother of all the arts—will have ascended her throne, surrounded by works so perfect that no rude and harsh criticisms will be heard, but only, as in Greece of old, a song of universal praise.

Let me, however, for a moment return to earth, for the purpose of making one more quotation and comment. “Architecture only flourishes in architectural epochs. The question is whether we can accelerate or retard such an epoch.” The Professor gives a satisfactory answer to the first, viz., “We can fit ourselves for the epoch when it does come.” As he says nothing about the second, I will venture to answer it. We can, and we do, retard the healthy and vigorous progress—the life—of architecture by persistent imitation of past styles. The more exact the copy, the greater the credit. In doing this, we may be good archaeologists, but we are bad architects. We might assimilate and digest ideas, not bolt forms and details bodily that disagree with us.

In conclusion, I should like to ask the Professor what he thinks of the collapse which Greek architecture suffered no less than Gothic, although, I presume, it is for it, equally with Renaissance architecture, that he claims the possession of the beautiful. Yet it perished in the presence of a debased rival style.

CRITICUS.

#### A Royal College of Architecture.

SIR,—I had originally intended, after having contributed my iota, and helped to make those responsible take up the subject in earnest, to withdraw from the arena of controversy on this matter, so as to make room for more influential men. However, Mr. Fleming’s notice of my scheme last week calls for further explanation on my part. By the way, may I remark that there ought to be no “controversy” about so desirable and laudable a topic; rather let “discussion” be the watchword, and that in a “helping” and genuine spirit. Even as I welcomed Mr. Fleming’s remarks, so do I also trust he will not resent the following observations which are made in good faith.

1. The fact that I am studiously acquainted with the real state of provincial pupilage leads me to place great confidence in the necessity (or desirability) of my proposed scheme. Suffice it to say that I am not the only one who has felt the want of adequate resources such as my proposal would supply.

2. Since Mr. Fleming lays special stress upon the effort made by the A.A. some few months back, I feel obliged to attempt to dispel what appears to me the grandiose illusion surrounding it. I will first comment upon the letter of December 31 last, issued by the Architectural Association.

(a.) At that date, evidently, the executive body of the A.A. shared views much akin to mine, only (according to the letter) far more vague and far less reaching. The very vagueness, the want of assurance that a determined effort was about to be made, doubtless caused many business men to little heed what must have appeared to them a well-meaning attempt, but without backbone. Since every town, taken “all in all” proportionally, is much like another in respect to the question before us, I will say of Worcester that I would then (had I at the time been informed therefore)—yea, would now make—an attempt to form a society, into which I believe I could have enrolled eight architectural students, eleven carvers (all of whom I know to be fully lamenting the divorce of ornament from the architecture of the day), six or more builders’ apprentices, and I doubt not for one moment that “all” the local architects and master builders would willingly have co-operated and served as officers of this miniature society of close on forty members (seniors included.)

There is already in this city a dead-alive architectural society of aristocratic origin. But local personages would be far more likely drawn into active co-operation at the instance of a decree from the R.I.B.A. than from its *protégé*. The letter should have been more definite, more authoritative, and have emanated from the Royal Institute. In face of the heterogeneous nature of my ideal local society as above, might not the Institute of Master Builders and (if there be one) of Sculptors, the Academy Art School, &c., be persuaded to join in the undertaking? None will dispute the advantage to pupils, in either branch, of such contact and intercourse during their studies. Since, in my opinion, the A.A. letter did not command the attention it expected, therefore do I strongly decline Mr. Fleming’s adoption of the majority of those few replies he did receive as an ultimatum.

(b.) A word about the A.A. notes which accompanied the letter. First of all, I feel convinced that the “present professional journals” (especially *The Architect’s* art plates) do not leave room for the “natural” growth of those “Notes” as at present conducted. As explanation, let me refer to A.A. Notes, Vol. II. No. 10, January 1888, folio 190. Under heading of “A.A. Proceedings—Art: Masonry and Stone-cutting,” occurs a notice of some articles; whereas those are just the sort of treatises which would make the “Notes” what they ought to be—but which they are not—of real use, had only the articles appeared in the A.A. Notes! Taking apart those notices of interest only to the metropolitan members of the Association, you will find but half left of any value to provincial students. Furthermore, on folio 189: “The Ventilation of a Grievance” sadly exposes the inadequacy of the Association to provide even for London men; it is noteworthy how the editor of the A.A. Notes endorses the complaints of “Adelphi.”

Therefore, for the above reasons, I think that the attempt which Mr. Fleming desires to be final is really far from a determined one, and is but superficial. I do not say the promoters did not feel very eager; I know they must have felt so to attempt a task beyond them. Yet I do not think, in face of “The Ventilation of a Grievance,” that anyone will doubt the total inadequacy of the A.A. “evening classes” to provide for the advanced professional education of “British architects.” The other two private schools mentioned, besides being in London only, and not under R.I.B.A. authority and protection (being private businesses), are expensive to the student. My society would not be so.

Lastly, different circumstances require different treatment. Medical men practise far differently to architects, and therefore require a different method of education; it is, therefore, unfair to compare them with us. The professions of architecture and the law are learnt under the system of pupilage, and seem likely to be for a considerable time; but while the architectural student is entirely unprovided for (at least in Worcester), yet the law student can obtain the most expensive books he wants from the local Law Society’s splendid library, and, moreover, his seniors go to the pains of organising mock trials for his practice, and the county courts are placed at his disposal therefor. All these occur in this city, and all for the law student. Where are we? In my scheme it is proposed to provide for the architectural student just what the law student has enjoyed for many years past. Is this too much to ask for?

Sincerely believing that it is not, and regretting those remarks which drew forth this present explanation, I remain, yours trustfully,

FRÉDÉRIC E. THOMASSON.

Worcester: June 11, 1888.

#### GENERAL.

A Loan Exhibition of Oil Paintings will be held in the Brighton Art Gallery during the autumn.

A Bas Relief was discovered in the excavations at the Acropolis of Athens on Tuesday. The subject is Minerva, who is seen leaning on a spear.

The Visitors to the Glasgow Exhibition up to Saturday last numbered 1,856,513.

Mr. Maunde Thompson was, on Saturday, appointed Chief Librarian of the British Museum, in succession to Dr. E. A. Bond.

A History of Wakefield Cathedral Church, by Mr. J. W. Walker, F.S.A., will shortly appear. The history of the fabric will be contributed by Mr. Micklethwaite, F.S.A.

The Church at Colwyn Bay, designed by Messrs. Douglas & Fordham, was consecrated on last Friday.

The Leeds Town Council, at a special meeting on Monday, decided to make an offer of 66,000*l.* to the trustees of the Coloured Cloth Hall Estate, and an offer of 28,000*l.* for the adjacent Quebec Estate, the purchases to be completed on the condition that both offers are accepted.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years’ imprisonment.

ROBERT BOYLE &amp; SON, LD.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

# LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

**TESTIMONIAL.**

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

BANGOR: N. Wales: Sept. 14, 1885.  
I remain, yours obediently,  
R. DAVIES, Architect.

Considerably Reduced Price List, November 1, 1887.

ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

W. & R. LEGGOTT, General Brass and Ironfounders and Finishers, Makers of Patents and Specialities,  
**235 HIGH HOLBORN, LONDON, W.C.;**  
**109 HOPE STREET, GLASGOW; SILENS WORKS, BRADFORD.**

TELEGRAPHIC ADDRESS—"SILENS BRADFORD."

## TRADE NOTES.

MR. F. C. KETTLE, auctioneer, of Tower Chambers, Moorgate Street, E.C., announces an important sale of freehold building land at Dovercourt, on the East Coast. The train service *via* Great Eastern Railway is the best on the East Coast, the trains running at frequent intervals during the day, and the fares are exceptionally low. The plots, eighty-two in number, will be put up for auction at three o'clock precisely, at the Cliff Hotel, Dovercourt, on Wednesday, July 25. For the convenience of intending purchasers a special train will leave Liverpool Street Station at 9.45 A.M., returning at 7 P.M. in the evening, the fares for which have been specially reduced, viz., first-class return, 5s.; second-class, 4s. The land is situated on the Marine Parade, Cliff, and other roads, and is within a few minutes' walk of the station. The estate offers exceptional opportunities to builders, marine villa residences being in great demand.

MR. M. TESTER has opened a dépôt for the sale of pneumatic and electric bells at 9 Bartlett's Buildings, Holborn Circus, E.C.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his Manchester grates and Manchester stoves, amongst other places, to the following post-offices:—Buckingham post-office, Amptill post-office, St. Leonards-on-Sea post-office, Guildford post-office, Southampton post-office.

THERE have recently been added two more artesian tube wells, 6 inches diameter, to the system of coupled tube wells in operation at the Aldershot Waterworks, to meet the additional requirements of the Government for the camp. These wells have each been completed by Messrs. Le Grand & Sutcliff, of

London, to the depth of 280 feet, in the short space of five weeks, manual labour only being employed.

A NEW gymnasium has been erected at Liverpool, and special attention has been paid to the ventilation. Messrs. Robert Boyle & Son's system is the one adopted, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

THE York Town Council have resolved to carry out a scheme of sewage and public improvement for the city at a cost of 93,000*l*.

THE contract of Messrs. Mowlem & Co. has been accepted for the erection of the central, eastern, and western towers of the Imperial Institute, at a cost of 18,797*l*., making the amount of the total contract for the main buildings 161,597*l*.

On Tuesday the Pontefract Town Council decided on applying to the Local Government Board for powers to borrow 28,632*l*., in order to carry out a scheme for bringing water from Roall, near Whitley Bridge.

MESSRS. JOHN BOLDING & SONS, of the Grosvenor Works, South Molton Street, have issued a new edition of their catalogue, containing hundreds of illustrations of the latest developments of sanitary appliances. It is arranged in a form which will be found most convenient for use.

## THE MELBOURNE CENTENNIAL INTERNATIONAL EXHIBITION.

THE Centennial International Exhibition has become a much more imposing and ambitious undertaking than was at first contemplated. The demand for space has been much greater than was anticipated. The buildings have had to be considerably extended, and the moderate estimate of cost which was in the first instance given has been very much exceeded. According to the last estimate made by the treasurer, the expenditure up to July 31 will be about 216,949*l*., and the net cost of the Exhibition to the country will be about 100,000*l*. Owing to various circumstances, one of which is the additions that have had to be made to the buildings, the arrangements made by the executive commissioners have had to be somewhat modified. It was intended that all the buildings should be completed by April 30, which is the date at which the contract for the new annexes expires, but the date has now

IN EITHER HARD OR SOFT WOODS.

Suitable for Architectural Purposes.

Illustrated Pattern Sheet and Price List on application to the Patentees and Sole Manufacturers,

JOHN EEDE BUTT &amp; SONS, Steam Moulding Works, BRIGHTON &amp; LITTLEHAMPTON.

been extended to June 30, and all that time will be required, as tenders for the construction of two additional annexes, covering  $3\frac{1}{2}$  acres of ground, have only just been let. Applications for space were to have been made not later than December 30 last, and all the space assigned was to be occupied by June 30. Applications for space have, however, continued to be received up to a very recent period, and the allotment of space cannot yet be completed, owing to the information required from countries with regard to machinery not having been received. Despite the many new difficulties that have arisen, the executive commissioners are confident that they will be in a position to open the Exhibition by August 1 next. The space covered by the buildings is very extensive, and the Exhibition will be the largest and by far the most important ever held, not only in Australia, but in any of the colonies of the British Empire. The main building and permanent machinery annexe cover 9 acres of ground. The main temporary annexes, as provided for in the original plan, occupied  $15\frac{1}{2}$  acres. A new bay was added on the south side, which gave a quarter of an acre, an extension of the French court added  $1\frac{1}{2}$  acre, the new northern annexe on the Rathdown Street side 1 acre, and the new eastern and western machinery annexes, for which a contract has just been let,  $3\frac{1}{2}$  acres. This gives a total of 31 acres, and with some additional space provided, the total area covered will be about 33 acres. The cost of the main annexes was 60,000*l.*, and the cost of the entire buildings is 114,000*l.*, so that here the treasurer's estimate of expenditure has been very much increased. The annexes, which are all constructed from the designs of Mr. G. R. Johnson, are built of wood, iron and glass. The new annexes form a series of arches, each of which has a span of 50 feet, and in the centre is a dome, which rises to a height of 165 feet from the ground. The ceilings of the central and eastern and western avenues are 50 feet high, and those of the annexes 35 feet high. The floor is level with that of the Exhibition building, and at the corner of Carlton Street and Nicholson Street it stands 22 feet from the ground. The noble proportions which the Exhibition has assumed will be best illustrated by a comparison. The Sydney Exhibition of 1879 covered about 15 acres; the Melbourne Exhibition of 1880, 22 acres; the Crystal Palace Exhibition of 1851, 20 acres; and the late Philadelphia Exhibition, 48½ acres. The recent exhibitions of London and Paris were of much greater magnitude, but it must be satisfactory to Australians to know that the Exhibition which is to celebrate the centenary of these colonies, in the area it covers,

approaches so nearly to that which was held in Philadelphia on the occasion of the centenary of the United States. The arrangements for the lighting of the building with electricity are well under way. The Australian Electric Light Company hold the contract for the Exhibition building and the main annexes, and they are following closely on the heels of the builders and the decorators. The installation is being carried out under the personal supervision of Mr. R. E. Fletcher, the company's electrical engineer. The systems adopted are the well-known Brush "arc" and Brush-Victoria incandescence systems. The Brush arc system has been extensively used at all the late English and Scottish Exhibitions, notably the Colonial and Indian, Edinburgh, Manchester and the Glasgow Exhibitions. All the arc-lighting of the Manchester Exhibition was on the Brush system, and over 500 lamps are being supplied to the Glasgow Exhibition. The lighting of the Melbourne Exhibition will, it is said, far exceed anything that has hitherto been attempted in this direction. The contract is for 825 "Brush" arc lamps, and 2,000 "Swan" incandescence lamps, with the necessary dynamo machines, conductors, fittings, &c. There will be 37 Brush dynamos, each capable of supplying electric currents to 23 Brush arc lamps, and 7 Brush-Victoria dynamos, each supplying current to 350 Swan incandescence lamps. Power for driving the machines will be supplied by six horizontal engines, coupled in pairs, each pair giving about 400 horse-power. Steam for these engines will be supplied from 12 boilers.

#### WORKPEOPLE'S PICNIC.

THE employés of Messrs. Jones & Willis, church furnishers and art workers in metal, wood, and stone, to the number of two hundred, and representing the various sections of their works in London and Birmingham, met at Oxford on Saturday, the 7th instant, for their annual picnic. After a round of visits to numerous colleges and public buildings, the party proceeded by steamer from Folly Bridge to the Isis Hotel at Iffley, where, after dinner, a cricket match between the two branches of the firm and a programme of sports were decided. The remainder of the day was occupied in other outdoor amusements, boating, quoits, &c., and after a most enjoyable time the party went back to Oxford, about one-half returning to London and the remainder to Birmingham.

## A CANAL LIFT.

AN engineering work of singular magnitude and importance has just been inaugurated at Arques, near St. Omer, in France. The undertaking so successfully inaugurated is the work of Mr. Edwin Clark, C.E., of Great Marlow, and an associate of Stephenson in the construction of the tubular bridge over the Menai Straits. The work comprises a canal lift, superseding the series of ordinary locks, which at present so seriously impede the traffic on the large canal system communicating with Belgium. The Continental canals are on a much larger scale than our own, the canal boats usually carrying from 210 to 230 tons. The ground at this particular spot rising very rapidly, there are five or six locks in close contiguity, involving great loss of time and great cost in their management. By this invention of Mr. Clark's the canal boats are now lifted the whole height of nearly fifty feet at one operation, occupying only a few minutes of time, and no loss whatever of water. This singular machine consists practically of a gigantic hydraulic press, whose piston is 3 feet 3 inches in diameter, and 50 feet in length, by means of which the boats themselves, actually afloat in an enormous tank or reservoir, are bodily raised or lowered, water and all, to the required height. This reservoir is in reality an actual length of the canal itself, made of wrought-iron plates, separated from the rest of the canal by iron gates, which are opened when it is raised into its proper position at the required height. There are two such presses, the one descending while the other is ascending, and they thus balance each other, and no steam engine or other mechanical power is required, although the weight lifted at each operation, including the water and the loaded barges, is very nearly 1,000 tons. Sixteen hundred barges have already been lifted prior to the public inauguration, the task being performed by a single man, whose only work is the opening and shutting of a small valve, and the operation only occupies a few minutes. A smaller lift on this principle was erected by Mr. Clark some years since in Cheshire, and was then patented, but he has just completed a still larger lift in Belgium, which will be opened during the present month. The introduction of this system will in future totally change the whole character of our canal systems, as a range of high hills may be thus easily traversed without any loss of water from the summit, and the same system is now being adopted in Canada for transporting sea-going vessels across the isthmus which intervenes between the Bay of Fundy and the Gulf of St. Lawrence.

## THE NATIONAL REGISTRATION OF PLUMBERS.

UNDER the presidency of the Mayor of Newcastle-on-Tyne, a largely attended public meeting was held on Monday in the Council Chamber "to consider the registration of qualified plumbers." Deputations, in most cases consisting of the mayor, medical officer of health, and town clerk, attended from the corporations of Jarrow, Gateshead, Sunderland, North and South Shields, Durham, Darlington, Stockton, the Hartlepoons, Tynemouth, Middlesbrough, Whitby, Carlisle, Whitehaven, Kendal, Blyth, and other places. Councillor Winter moved "That a District Council for Northumberland, Durham, Westmoreland, Cumberland, and North Yorks, be formed to carry out the system of registration for that district, and that the Council shall consist of master and operative plumbers and the public." Professor Garnett seconded the motion, and gave an account of the work done in technically educating plumbers, and said he was authorised by the masters and operatives of the district to express their approval of the registration system. The motion was unanimously carried.

## WATER-POWER IN THE UNITED STATES.

AN article on the statistics of water-power employed in the manufactories of the United States, by Professor Swain, appears in one of the recent publications of the American Statistical Association. In the course of it the Professor writes:—

It may safely be said that in no country in the world is there so large an amount of water-power employed as in the United States of America. The water-power of the country is not the least important of its natural resources, and its value is probably not realised properly. According to the returns of the Tenth Census, there were in use for manufacturing in the United States in 1880 55,404 water-wheels, using a total power of 1,225,379 horse-power, this being 35.93 per cent. of the total power employed in the country for manufacturing purposes. The value of water-power, like that of any other commodity, is governed by the law of supply and demand, and depends upon a multitude of circumstances; but inasmuch as water-power could not, in any part of the country, be replaced by steam-power at a less annual expense than about 20 dollars per net effective horse-power, it will certainly not be an exaggeration to assume that figure as the annual value of a horse-power.

LONDON OFFICE:—20 BUCKLESBURY E.C.

On this basis the annual value of utilised water-power is about 24 million dollars. If it be desired to obtain some idea of the actual, not the annual, value of this power, the above amount may be capitalised at 5 per cent., giving the sum of, say, 500 million dollars. This, however, it must be remembered, represents only the value of the water-power already in actual use. The total theoretical power has been estimated, on the average throughout the year, at over 200 million horse-power.

The utilised water-power (1,225,379 horse-power) is considerably greater than the total amount of power (both steam and water) employed in the manufacture of cotton goods, woollen goods, foundry and machine-shop products, iron and steel, and paper combined. If this power were employed in hauling a train of cars on a level track at 30 miles an hour, the train would weigh about  $1\frac{1}{2}$  million tons, or, if made up of the heaviest loaded coal cars, would be about 165 miles long, while, if made up of Pullman coaches, it would be 500 miles long.

A comparison of the annual value of the water-power with that of the mines shows the following result:—Annual value of utilised water-power at 20 dollars per horse-power, 24,000,000 dollars. Value of pig-iron produced in 1885, 64,700,000 dollars. Coining value of silver produced in 1885, 51,600,000 dollars. Coining value of gold produced in 1885, 31,800,000 dollars. Value of coal mined in 1885, 159,000,000 dollars. Net earnings of all the railroads in the United States in 1885, 266,488,993 dollars.

It is thus seen that the water-power of the United States ranks among the most important "products" of the country.

The following is a statement of the main elements which are to be considered in examining the water-power of any region, and in estimating its value. That water-power will in general be the more valuable:—*a.* The greater the slope of the streams. *b.* The more nearly the fall of the streams is concentrated at definite points, the fall at each being neither too great nor too small for economical development. *c.* The more permanent the falls are, *i.e.*, the harder the rocks which cause them. *d.* The nearer the falls are to navigable waters, and the better the facilities are for transportation by rail. *e.* The larger the average flow of the streams. *f.* The more uniform the flow of the streams—that is, to enumerate the principal factors contributing to this result:—1. The more favourable the distribution of rainfall through the year. 2. The less severe the winters. 3. The more extensive the forests. 4. The larger the number and area of lakes or artificial reservoirs.

5. The less steep and rocky the drainage basin (within limits).
6. The larger the drainage basin.

Glancing over the country, and bearing these facts in mind, in New England almost the ideal condition of things is found; the streams have a large slope, with concentrated falls over the ledges of metamorphic rock, which underlie the entire region, the rainfall is favourably distributed, the forests are extensive, the lakes large and numerous, and the facilities for transportation excellent.

Passing westward and southward into the middle States, there is found a good water-power region drained by the streams flowing into Lake Ontario. The rainfall, though perceptibly smaller than in New England, is favourably distributed, being greatest in the summer and autumn, and the streams are well sustained in flow. The greatest power in the country, and probably in the world, occurs in this region—Niagara, with its total of over six million horse-power from lake to lake, or over five times the total utilised water-power of the country. Like the other falls in this vicinity, Niagara is gradually receding as the comparatively soft rocks are worn away by the mighty forces at work.

Throughout the remaining region of the middle States the facilities for water-power are not so good. The slopes of the streams are gradual, and abrupt falls are comparatively rare, owing partly to the topography and partly to the softer character of the rocks. The Susquehanna river, for example, though the largest stream on the Atlantic coast, offers not a single large utilised power and but few sites where power would be economically available, by reason of its great width at the places where falls occur. Going further south, a region of harder rocks, though not like those in New England, is met with, and the most striking difference, topographically, between the streams of the latter region and those south of the Hudson and Delaware is in the fact that, while in New England the falls are concentrated at distinct points, towards the south the slope of the streams, though not smaller, is nevertheless more uniform, and the falls occur generally in the form of long shoals, which, on account of the length of canal required, and the great width of the rivers at these places, would in general be difficult to develop. There are, of course, exceptions to this statement, and numerous places may be pointed out in the southern Atlantic States where concentrated falls occur precisely as in New England, but the above is a general statement of the case.

As regards the distribution of power among the more

important industries, the largest proportion of water-power, 70·70 per cent., is found in the case of paper mills. These mills require large quantities of clear water for purposes of their manufacture, and would naturally be located on some stream, so that the larger proportion of water-power is easily explained. Again, of the total power used in flour and grist mills, about 61 per cent. is water-power. This finds its explanation in the fact that the majority of these mills are small, and for local use only. The raw material and the finished product are respectively produced and consumed in the immediate neighbourhood, and convenience of transportation enters little into the question, so that water-power, on account of its intrinsic cheapness, is preferred. In the manufacture of cotton and woollen goods one-half the total power is water-power, and in the case of worsted goods the proportion of water-power is still above the average for the entire country. On the other hand, the proportion of water-power employed in the manufacture of boots and shoes, and of iron and steel, is very insignificant. In the former case this is explained by the very small amount of power used per establishment, the small use of water for purposes of manufacture, and the almost forced location in certain places, and in the case of iron and steel, questions of location and ease of transportation explain the small proportion of water-power. In fact, if the proportion of water-power in the manufacture of iron and steel be compared with that in foundry and machine-shop products, where it is used in smaller and more local establishments, there is found a much larger proportion in the latter case.

#### BLASTING IN THE PEAK FOREST.

IN continuation of a series of blasting operations a big shot was fired at the limestone works of Messrs. T. Beswick & Sons, the Peak Forest, near Buxton, on Wednesday. Forty feet below the surface the rock was tunnelled a course of 81 feet turning both right and left, and in a chamber at the extremity two tons of powder was placed. The fuse was fired by Mrs. Beswick, and the explosion, watched by hundreds of people who lined the hill sides, occurred in eighteen minutes. The rock lifted in the centre like a huge cone, and then fell in a broken heap almost ready for trucking. It is estimated that 50,000 tons was quarried, the experiment being in every way successful. At a luncheon, to which distinguished guests were invited, Professor Sheldon proposed "The Lime Trade."

#### THE MANCHESTER SHIP CANAL.

ALL along the route of the Manchester Ship Canal the work of excavation is now being carried on, says the *Manchester Guardian*, at high pressure. The engineer has obtained possession of the land formerly used as a sewage farm by the Barton Rural Sanitary Authority, and now has practically complete possession of the whole of the land necessary for the completion of the works between Eastham and Manchester. It is expected that no difficulty will arise to prevent possession being obtained of the small quantity of land that has as yet not been formally yielded up by its former owners. The opposition threatened from Stretford will probably be no more heard of, and the land required from Sir Humphrey de Trafford for the dock, on the Stretford side of the river, has been purchased. It is anticipated that the Ship Canal (No. 2) Bill will be passed with very slight delay; and work on the site of the Manchester and Salford docks will soon be in full swing. The contractor's railway from Eastham to the river Weaver has been completed, and there will also shortly be a continuous line from the Manchester docks to Runcorn. The task of diverting the various railways which cross the line of the canal near Warrington has just been commenced, and the land required in order to carry out the diversion of the river Mersey across the Arpley Meadows, preparatory to commencing the dock works there, has been purchased. Although to some slight extent the weather recently has interfered with the operations of the contractor, the progress made has been exceedingly satisfactory, and the work done is quite up to, if not beyond, the amount estimated to be finished by this time in order to have the works completed within the stipulated period. The contractor is making arrangements for the addition of a large quantity of new plant, and on several sections of the canal work is being carried on both by night and by day. The operations on the Eccles and Barton sections are being pushed on with great vigour. At Stickings Island the required depth has almost been reached. An American "navy" has also arrived at this point, but it is not yet fitted up. A large bed of rock of considerable thickness has been encountered, and men are now engaged boring holes preparatory to blasting. At Salt Eye the American "navy" has made considerable progress, a depth of 20 feet having been reached. Large embankments, which run in a parallel line from the works near Roch House through the meadows to Flixton, are being made. At Barton

**ORNAMENTAL PARQUET.**  
DEAL BACKING.

blasting operations are in full swing, men being engaged shaping the blocks of rock for future use in the constructive works, and also to form the new entrance to Trafford Park, now in course of formation, from Dimplington Lane, Barton, through the fields, over the canal, and into the park. Preparations are being made for the erection of a wooden bridge to span the river between Stickings Island and Hulme's Bridge, and the erection of a second bridge over the river between Hulme's Bridge and Calamanka Locks will make the works one continuous length from Barton to Manchester.

#### TECHNICAL EDUCATION.

THE following remarks on technical education, from the hygienic point of view, appear in the *Lancet*, and have special interest at the present time :—

On any question relating to industrial development Lord Armstrong writes with an authority second to none, and it is therefore with great satisfaction that we find him reiterating and enforcing the views which we ourselves recently put forward upon the subject of technical education. We then spoke of the importance of developing the faculties of the child by this means, and pointed out that something quite different from a mere anticipated apprenticeship was required, both from an economical and a hygienic point of view. Looking at the same problem from the standpoint of a large and enlightened employer of labour, Lord Armstrong discerned the same features in the case. He deprecates any attempt to teach trades to school children, knowing full well that this can better be done when they come in riper adolescence to enter the factories and workshops where actual work is being carried on. But he also points out how great is the advantage to the grown man or woman of coming into possession, when mature age is reached, of mobile and manageable fingers and of trained eyes and ears. Knowledge, as distinct from the faculty of acquiring it, he estimates at a comparatively low value, since the knowledge that can be imparted to a child is necessarily of a somewhat vague description, and in most cases not such as will prove to be of any use to him in after-life. And this must be admitted to be in a large measure true. Orthography is of much less importance to a stonemason than a knowledge of the structure of stone, or to a bricklayer than the use of the plumb line. But

the answer to such an objection to the ordinary curriculum of our elementary schools is that the special knowledge of one trade is even more completely useless to the craftsman of another than is the general knowledge which has of late been so unsparingly denounced as "bookish." Nothing would be gained by substituting the study of chemistry for the study of grammar in ninety-nine cases out of a hundred, and something would in every case be lost. We doubt, therefore, if it is necessary, or even wise, to depreciate the studies to which by our present system the attention of children is chiefly directed, but we heartily concur in the opinion, expressed both by Professor Huxley and Lord Armstrong, that the present system is insufficient, and does not adequately develop the faculties of the young. We think, further, that they have very wisely fixed upon drawing as a subject of study eminently fitted to train both eye and hand, and one to which, therefore, a much more important position might with great advantage be assigned than it at present occupies.

#### WATER-GAS.

A DESCRIPTION of an important step which has been taken by the Leeds Forge Company towards the introduction of what is called water-gas is given in the *Yorkshire Post*. This is to some extent misnamed, as it is not manufactured solely from water, but from water and ordinary carbonaceous fuel. It has long been known that if steam is forced over a sufficient quantity of red-hot carbon in the form of coke or charcoal, an action takes place which results in the production of a mixture in equal volumes of two inflammable gases—hydrogen and carbonic oxide. The water is decomposed, and its oxygen unites with the carbon. This has now developed into a manufacturing process, which bids fair to revolutionise the gas industry. Commercial water-gas is made by blowing air and steam alternately through a considerable depth of fuel. The air-blast is maintained until the mass is vividly incandescent, and meanwhile the escaping vapours are led away to be burned in the works like the gases which are collected from the top of a blast-furnace. As soon as the mass is hot enough steam is substituted for air, and the water-gas produced by its passage through the hot fuel is deflected by a valve into a gasometer. When the temperature has fallen considerably the air is admitted again, so that there is a continuous alternation of

action. In this way a ton of the commonest and cheapest coal can be made to produce about 35,000 cubic feet of water-gas and 140,000 feet of the so-called generator gas. Compared with these results the Leeds Gasworks produce from 1 ton of coal 10,000 feet of coal-gas and between 13 cwt. and 14 cwt. of coke. For some time back water-gas has been in considerable use upon the Continent, being employed for all sorts of purposes for which we use the common coal-gas. By itself it is no use as an illuminant. The flame of hydrogen is hardly visible, and the carbonic oxide burns with a pale-blue light. Either the gas must be carburetted by adding to it the vapours of some volatile substance, or an infusible object must be introduced into the flame after the fashion familiar to every one in the lime-light. Water-gas has, however, two dangers about it from which our common household gas is comparatively free. First, it is inodorous, so that some strong-smelling vapour has to be added to it in order to make any escape of gas reveal itself; secondly, carbonic oxide is a strong and active poison.

## NEW CATALOGUES.

THE illustrated catalogue of Messrs. P. E. Chappuis & Co., 69 Fleet Street, E.C., deals with patent daylight reflectors of every description; also silvered glass, and silver-plated copper reflectors for gas and other artificial lights, of all which they are the manufacturers. The quality of material and excellence of manufacture are guaranteed. The pre-eminence of the goods of this firm in the market must be acknowledged by the hall mark of public appreciation, accorded as seen in so much patronage—royal, state, public and private patronage—along with that of municipal and incorporated bodies, companies, institutions, &c. Ample information, however, can be found as regards this point in the nine concluding pages of the catalogue. Messrs. Chappuis & Co. were in 1887 appointed by royal warrant manufacturers to Her Majesty the Queen, and in 1884 were awarded a silver medal at the International Health Exhibition. The firm was established in 1851, and ever since the business has steadily increased. Over 50,000 of their daylight reflectors are now fixed in London alone. They are also in general use throughout Great Britain and Ireland, and have been extensively adopted in all the principal towns of Europe, and large numbers have been exported to India, Canada, Australia, New Zealand, Cape of Good Hope, United States, China, Japan, Brazil, and the Argentine Republic. The accom-

panying sketch shows very adequately the light-collecting power of the silver on glass reflectors with the illumination resulting. Messrs. Chappuis's patents consist of carefully selected and highly polished patent silvered corrugated surfaces, fitted into strongly made wooden frames, so constructed and painted as to resist the action of the atmosphere, and fixed by means of iron fittings and chains to existing windows, as shown in the sketch. Their utility is too well known to need any explanation. They are certainly indispensable in buildings where day-

light is obstructed, whether owing to the peculiar construction of the premises, the small dimensions of windows, the proximity of opposite walls, or other local causes. They can be easily adopted where there is either a grating, area, window, or skylight, and will effect a considerable saving in the cost of gas or oil, and conduce to the general health and comfort. For shop-fronts reflectors can be made ornamental, of mahogany, oak, or teak, or with glass backs, gold or colour lettering, &c.,

ANCASTER, NEAR GRANTHAM.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any other  
Fire-grate introduced to the public. It is very simple in  
construction, and is made in the form of a Stove, the back  
of which is semicircular in shape, with gills behind and  
smoke-nozzle on top, all cast in one piece. The same can  
be attached to any design of a Register or Stove front. It  
is very suitable for schools, class-rooms, waiting-rooms,  
hospitals, offices, dormitories, and dwelling-houses, from  
the cottage to the mansion. Design and specification post  
free on application.

## TESTIMONIALS.

SIR.—I have much pleasure in testifying to the efficiency of  
your patent warm-air fire-grate. It has been very successful,  
and given every satisfaction where I have used it.

Yours, &c., JAMES WEIR, F.R.I.B.A.,  
6 John Street, Bedford Row, W.C.

To Mr. Grundy.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect,  
28 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out  
his plan of warming in several churches built under my  
direction, and in each case it answers remarkably well, and has  
given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly  
indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of com-  
mendation as to the apparatus you supplied for heating Derry  
Cathedral. Not only is the air of the Cathedral quite pure and  
pleasant to those attending the services, as it must be from the  
fact that most of the air heated is taken from the outside, but I  
find the building itself is so much benefited, as formerly it was  
damp and smelt damp, but now it is very dry and free from any  
musty smell. I find that, although the Cathedral is now much  
larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is  
completely warmed by your new grate. It is the most economical  
and efficient that I have ever seen.

Mr. John Grundy.

Apply to JOHN GRUNDY, 30 Duncan Terrace,

thus answering the twofold purpose of lighting and advertising. The various qualities with particulars of price and other details, and also the different forms are explained, as well as the fittings, and attention has been paid to minor matters such as window tell-tales, reading-in-bed reflectors, &c. Besides the qualities enumerated in the list, Messrs. Chappuis manufacture the silver-plated copper reflectors, in quantities of not less than twenty. These are found preferable in many remote places abroad, or where there is a great danger of breakage (although a wire guard, fixed over ordinary glass reflectors, will protect them from any risk). The patent Myriastratic is manufactured specially to diffuse a soft light, and the staircase reflectors are so constructed as to break up and diffuse the light to the utmost extent; also counter reflectors for inside use.

## PATENTS.

PATTERN BOOKS ON APPLICATION.

## COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

12141. George Kelley, for "Improvements in locks and latches." Sept. 8, 1887.

12197. James Bazeley Petter, for "Improvements in the construction of theatres, public buildings, and other places of entertainment, for the prevention of fatal results from fire." Sept. 9, 1887.

12328. Andrew Mellville, for "Improvements in fireproof curtains for theatres and other buildings." Sept. 12, 1887.

12264. Charles Mackay and Edward Vernon Bailey, of the firm of Bailey & Mackay, for "Improvements in securing or connecting knobs to doors and other articles." Sept. 10, 1887.

## PATENTS SEALED, JULY 13, 1888.

7990. John Imray, for "Improvements in incandescence gas burners." July 2, 1888.

8738. Samuel Reeve, for "Improvements in means or apparatus for use in effecting the warming and ventilating of apartments and other places." June 17, 1887.

8893. Edwin Tudor Owens, for "An improved device for operating fanlights, skylights, ventilators, and other similar movable parts of structures." June 22, 1887.

9298. Charles Showell, for "Improvements in brackets for supporting roller ends, and for other similar purposes." June 30, 1887.

9535. Thos. Smith, for "Excavating apparatus." July 6, 1887.

10244. John Samuel Rigby, for "Improvements in the manufacture of cement." July 22, 1887.

14720. William Henry St. Aubin, for "Improvements in rack pulleys for window-blind cords." Oct. 29, 1887.

4632. Henry Atkinson Caulkwell, for "Improvements in the manufacture of tiles." March 26, 1888.

4711. Henry Harris Lake, for "Improvements in and relating to lavatory basins." (Thomas Charles Boyd and James Joseph Wade, United States.) March 27, 1888.

## ABRIDGMENTS OF SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in flush bolts." H. F. Bangert. No. 11265 (1887). The object of this invention is to provide a self-acting flush bolt for effectually securing folding doors of bookcases, &c., so that such doors may be automatically bolted

by the action of closing the door, and similarly unbolted when the doors are unlocked and opened.

*Claim.*—I.—In a flush bolt as applied to folding doors, the combination of a projecting pin attached to said bolt engaging with a corresponding inclined slot upon the edge of the opposite door, substantially as and for the purpose herein described and set forth.

"An improved parallel ruler." H. H. Lake. No. 11362 (1887). This invention has for its object the ruling in an easy and automatic manner of parallel and equi-distant lines. A small scale is attached for obtaining regular distances that separate the parallel lines to be drawn.

"Improvements in the manufacture of door and like bolts." E. Nightseales and J. Illingworth. 1316 (1888). This invention relates to improvements in the lugs of barrel, tower and other bolts, and consists in having the lug slotted so that when the bolt is turned with this groove or slot, after having been shot, it rests there securely, and cannot be shaken from its position by wind or other agency.

*Claim.*—Improved lugs for barrel, tower and similar bolts which prevent the bolts being moved after being placed in position (except at will), substantially as hereinbefore described and represented by the accompanying drawings.

"A new arrangement of toggle-jointed levers for imparting a double pressing motion for use in moulding and pressing bricks, briquettes, tiles, fuel blocks and other articles." T. C. Fawcett Whitehouse and J. D. Fawcett. 7305 (1888). This invention has reference to a prior patent granted to T. C. Fawcett, dated March 29, 1887, and numbered 4634.

*Claim.*—In toggle-jointed levers for imparting a double pressure, the combination therewith of a knuckle or link, whereby the said levers descend further during the second squeeze than during the first, all arranged and operated in manner substantially as herein described and illustrated.

"Improved roof tile." Syd. Turner. This tile is constructed so as to form a projection along the tile under the wing, forming a groove for a fillet of the adjacent tile to enter. This projection of triangular or other shape, when jammed under the fillet, locks, and is locked by the adjacent tiles.

*Claim.*—The formation of a projection (A) where shown on the drawing, and as above described.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialist in Building matters. Information free.—G. H. RAYNER, Patent Agent, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

It will soon be possible to decide about the real cause of the backwardness of the Wolverhampton Art School. Fourteen out of the seventeen members of the committee have resigned, because a majority of the Town Council decided against their proposals. According to the Art Committee, everything is owing to the head-master's inefficiency, which arises from his age. Indeed, one of the councillors reproached the master with his industry, as if it were a disgrace, and told him that he ought to be able to be independent of work. It was asserted that the master was not treated with civility by some of the members of the committee. We have before now spoken on the subject, and we must say we believe that Mr. GUNN has to suffer because he is not pleasing in the eyes of men who, apparently, suppose that a master of a school should be of a physique that would enable him to serve as a model of an APOLLO to the students. A good deal is made out of the circumstance of a young lady preferring a school in Birmingham, but are feminine whims to be the test of a school that was founded for teaching industrial art? It is plain from the heated discussion in the Council chamber that the unfortunate master is made a scapegoat. The school is starved; there are few casts, and the majority of them belong to Mr. GUNN. The building is badly lighted, and it would be odd if it were otherwise, for, according to the chairman, "the building was erected under the direct superintendence of a Science and Art Department inspector." Money is grudging, and the report that Birmingham receives 2,000*l.* in Government grants gives rise to the notion that a corresponding sum could be drawn by Wolverhampton. As most of the committee have retired, the master of the school will probably be less hampered than heretofore, and the Town Council will do well to act generously in supplying the deficiencies of the school. It is admitted that whatever taste may be in Wolverhampton is mainly owing to Mr. GUNN's efforts, and his dismissal from his office would be a strange way to express gratitude.

ON to-day, Friday, the decision will be given about the Prix de Rome for painting. The ten competitors completed their compositions, which have a common subject, viz., *Ulysses and Nausicaa*. With one exception, M. CHARPENTIER-BORIS, the candidates are less than thirty years of age, but none is under twenty-four. It is evident from this that all competitors must go through a long training before they are eligible to enter the "loges." Six of the artists are Parisians and one is from Sèvres in the suburbs. The three provincials are from Lille, Angoulême and Marmande. The ten competitors are MM. VERDIER, LENOIR, CHARPENTIER-BORIS, THYS, LAVALLEY, MARISSON, BUFFET, BOYÉ, ELIOT, VEBER. The three named last appear for the first time, the remainder having already competed without success.

SCOTLAND is so rich in granites, &c., it is only natural that stone alone should be deemed to be a suitable building material, and that brick should be despised as a make-shift. That a prejudice exists against brick and against tiles will be admitted by every one who is acquainted with the country. The Dean of Guild of Edinburgh is not proof against it. At the last sitting of the Court Sir JAMES GOWANS found fault with plans showing an alteration proposed in the Edinburgh Academy, because a wall was intended to be built in brick. The Court was, he said, opposed to the practice of using brick and stone that was creeping in, and which was destroying the old town. Sir JAMES said he could point to buildings in the city where the architects were going out of the way and spending more money by building in brick instead of in stone. So long as he was chairman he would set his face against the practice of disfiguring stone buildings by the introduction of brick. The applicants took the hint and their plans were then approved. In architecture, the question of a mixture of materials depends on the way they are used. The French,

whose buildings are allied to those in Scotland, and whose taste is not to be questioned, are not afraid of using brick with stone. Something of unity may be sacrificed for the sake of colour, especially when, as in Edinburgh, the uniformity of the stone is not seldom rather monotonous. A red brick building is so welcome a sight in a street of a Scottish town, it is no wonder that architects are eager to see even part of a building of that colour. Sir JAMES GOWANS may be right in the case he condemned, but it is to be hoped he will not exclude good brickwork from Edinburgh because stone is plentiful.

THE report which was read at the annual meeting of the Royal College of Music on Tuesday, stated that the Council had the gratification of reporting that there was every prospect that the inconveniences arising from insufficient accommodation in the college will be shortly removed, Mr. SAMSON FOX, of Leeds, having offered a munificent gift of 30,000*l.* for a new collegiate building on an appropriate site, to be determined by Her Majesty's Commissioners of 1851, who had granted a site for the new building on the South Kensington estate in Princes Gate. Mr. MUNDELLA described Mr. SAMSON FOX as a man of the people. Working from his early youth, and gifted with great natural talent as an inventor, he had raised himself to a position which enabled him to do a yeoman's services to his country, and having in the course of his arduous struggle upwards found in music his joy and his solace, he was now offering to the nation the advantages and the pleasures which he himself had derived from the cultivation of that beautiful art. It is an admirable way to express enthusiasm by erecting a new and handsome college for the accommodation of 400 students.

THE name of the late WILLIAM EDEN NESFIELD, architect, was introduced in the Probate Court on Monday. He died on March 25 at Brighton, leaving property worth about 25,000*l.*, a larger sum than many of Mr. NESFIELD's acquaintances would have anticipated as possible. In last August he made a will, by which Mrs. NESFIELD was to become universal legatee and devisee and sole executrix. But by a curious coincidence, in the August of the year preceding Mr. NESFIELD had also made a will in which Mr. H. W. NESFIELD, the brother of the architect, was declared to be the residuary legatee. The revoking of a former will is no easy matter, and Mr. NESFIELD accordingly opposed probate of the will of August in 1887, on the ground that his brother was not of sound mind, and therefore it was not duly executed. An action carried on under those circumstances would diminish the architect's savings, but happily the case was settled after it was opened in Court. As soon as Mr. NESFIELD was able to look through the documentary evidence, he concluded that he ought not to offer any opposition to the latest arrangements made by his brother in respect of property. Sir J. HANNEN accordingly pronounced for the last will, and each side will have to pay its own costs, which must be still a large sum.

M. ARBOIS DE JUBAINVILLE has started a new theory about the beautiful spiral bracelets and collars which are found in Ireland. In a paper which he read at the last meeting of the Académie des Inscriptions, he argued that they were used as a sort of money as well as for adornment. In the Museum at Saint-Germain there is a very heavy spiral bracelet of gold, and M. ARBOIS DE JUBAINVILLE has observed that one of the ends appears to have been cut, as if a length of gold of a certain thickness was recognised as having a definite value. In an Irish manuscript of the ninth century, he has found an account of a sale in which several golden ornaments are mentioned, and the weights of some are given. One of them exactly corresponds in weight with the bracelet in the Saint-Germain Museum. The conclusion drawn is that gold ornaments took the place of coins, as they formed a more convenient means of circulation than cattle. A rich man could thus have the gratification of adorning himself with his wealth, and it may have been wiser than to store the gold in a cellar. At any rate more artists were employed under the old system.

## BACK-TO-BACK HOUSES.

THERE are French writers like M. EDMOND SCHERER who look on England as the Holy Land of Liberty, as ground which visitors who have lived under Continental governments are bound to kiss on landing. In it every one can do as he or she likes without any restraints, which elsewhere surround people from their birth. Out of England, says M. SCHERER, civil life is enclosed in an invisible but insurmountable net of restrictions. But as the poet was tired with too much liberty, prosaic people may also occasionally feel that restraint is not without its use. The *laissez faire* policy is discovered to be suited only for an Utopian state, where the inhabitants think less of themselves than of their fellows.

The length to which individual license can run in one direction is seen in the report to the Local Government Board on "Back-to-Back Houses," by Dr. BARRY and Mr. GORDON SMITH. It must have been evident when houses of that class were devised that they were wanting in many of the conditions of habitations for human beings, and it might be supposed that some sort of authority would demand valid reasons for the departure from the common type of English cottage. What seems to have been paramount was the question of profit, and so long as a landlord was able to derive a return that he considered satisfactory, the inconvenience of the tenants was ignored. It might be supposed that English liberty could not exist without the application of the screw to the necessitous. The only advantage which back-to-back houses can be said to have is that they are a little cheaper than through houses. But even the smallest fraction becomes important in the eyes of the men who build them, and to insure it they are indifferent to the sufferings of the unfortunate people who are compelled to become their tenants. We find from the report before us that in Morley interest at the rate of 5*l.* 10*s.* 1*d.* is obtainable from investment in through houses, but the back-to-back yield 5*l.* 19*s.* 9*d.*, and the few shillings turn the scale, and in consequence 82 per cent. of the houses are on the more profitable plan. In Staniland the difference is between 4*l.* 19*s.* 4*d.* and 4*l.* 15*s.* 7*d.*, and the chance of obtaining the extra 3*s.* 9*d.* inspires the erection of 52 per cent. of back-to-back houses. In other towns, where there was an investigation, the profit was higher. Halifax shows 18*s.* 4*d.*, Todmorden 15*s.* 1*d.*, and Keighley 16*s.* 3*d.*; but as in Todmorden through houses pay 7*l.* 8*s.* 6*d.* per cent. and in Keighley 5*l.* 13*s.* 9*d.*, it is only a grasping spirit who would be dissatisfied with that rate of interest, and he must have inhumanity in him who would jeopardise the lives of people in order to gain less than one per cent. in addition.

For the risk of living in back-to-back houses seems to be as certain as any deduction in sanitary science. In Salford we are informed that "in certain streets and courts consisting of back-to-back houses, unfurnished with through ventilation, tubercular disease was much more common than in other parts of the same town, and that such disease occurred again and again in the same houses." Special inquiries in Salford by the authors of the report confirmed these conclusions, as "there was a progressive increase in the mortality from all causes and from each of the specified causes of deaths in direct proportion to the number of back-to-back houses." In Bradford, when an epidemic broke out, the Medical Officer of Health found that out of the 101 houses in which deaths had occurred ninety were of the back-to-back description. If returns were prepared in other towns with similar houses, we suppose the results would correspond with the foregoing.

That it is the absence of through ventilation owing to the planning of the houses which is the cause of the danger is evident. The construction of the houses in the Yorkshire towns described in the report is as sound as can be expected, considering the rent which is charged. We are informed that materials and work are good, so are the bricks, and the mortar is better than in some southern districts. When there are stone quarries in the neighbourhood the walls are frequently from 12 to 15 inches thick, the timber used is adequate, and, in fact, "there is no marked difference whatever between the character of the ordinary back-to-back house and the through house." Indeed it might be supposed that the quality of the work becomes a defect, and that if the walls were less closely

built and the woodwork had shrunk there would be more ventilation in the houses, and in proportion more safety for the occupiers.

Fortunately there is less real danger from fire in small houses than from an absence of ventilation, or it would go hard with the tenants. It appears that the regulations which are intended to keep fires from spreading, such as those which prescribe a thickness of 9 inches at least for party walls, the carrying up the wall a certain height, the avoidance of bond timbers in walls, &c., can be easily evaded in building back-to-back houses. How it is done is described in the report as follows:—

In the case of a row of through houses, every house, except the two end houses, will be concerned with two party walls and two external walls, but in the case of a row of back-to-back houses, each house, other than the four end ones, will be concerned with three party walls, and only one external wall. Hence, any saving that can be effected in the construction of the party walls of new buildings will produce a larger saving in the case of back-to-back houses than of through houses. This particular item of saving of cost has, we think, tended considerably to create the impression that back-to-back houses are cheaper of construction, and can therefore be let at lower rents than through houses affording the same amount of accommodation. There is accordingly a tendency in certain places to construct party walls only half a brick (4½ inches) in thickness, and to carry them up no higher than is absolutely necessary to separate the rooms in one house from the rooms in the next house, *i.e.*, up to the ceiling-joists of the top storey, so that in a row of houses the space in the roof above the ceilings of the top storey of the houses is continuous from one end of the row to the other. For similar reasons of economy the timbers of the several floors, and certain timbers of the roof, are frequently built into the party walls in such a way that the ends of joists and roof timbers, inserted on opposite sides of the same wall, are in close proximity to, if not in actual contact with, each other. Now a brick party wall only 4½ inches thick cannot be regarded as affording reasonable safety against the spread of fire, and still less can any party wall be so regarded if it be incomplete in height, or if it in any way allow the timbers of floors and roofs to be continuous from one house to the next. Nor, indeed, can such party walls be regarded as sufficient for purposes of health, since, owing to incompleteness, the atmosphere of one house would be common to the other houses in the same row, a condition which could scarcely fail to be a source of danger in the case of any infectious disease; and yet it is by no means uncommon to find the party walls in rows of houses incomplete, being stopped short at the ceiling-joists of the top storey, sometimes only 4½ inches thick, and very frequently with continuous timber through the party wall from one house to the next. Sometimes these arrangements are carried out notwithstanding their prohibition under the local by-laws.

It will be asked why the by-laws or other municipal regulations are not enforced in order to remedy the evils of back-to-back houses? One reason is that in many places there is a sort of conviction that dwellings of the kind are unavoidable, as they are believed to be the cheapest way of supplying a necessity that is largely felt. The humblest English workman or labourer likes to enjoy the satisfaction of having a house, and as a rule he is ignorant or indifferent about defects of sanitation. If speculators are forthcoming who will furnish all that a man of that kind cares for, and at what appears to be a reasonable rent, it is hardly to be expected that the authorities of a town will be too keen in their scrutiny of shortcomings, or illiberal in their interpretation of rules. The housing of the mass of the people is no easy problem, and there are times when any aid towards its solution will be welcome. No one will, therefore, be surprised on learning that in Halifax the requirements about the ventilation of back-to-back houses "are exceedingly meagre;" or that in Morley the clause about ventilation, although of pre-eminent importance, "appears to have hitherto remained a dead letter in the district;" or that in Todmorden the ventilation clause is totally neglected; and in Keighley is "rarely, if ever, carried into effect." The neglect of by-laws partly arises from the necessity to have many cheap houses, and partly, we suppose, from a recognition of the liberty of the individual, landlords and tenants.

There is another peculiarity of back-to-back houses of which the effects are explained at length in the report, but it is hardly a subject for notice in a journal. But when such items as the following are to be found in the tables, "Four privies for twelve houses in the space between the two blocks of six houses each, greatest distance 65 feet," and when in other places the distances are from 110 to 140 feet, the wonder is that the consequences are not more serious.

Mr. GORDON SMITH takes great pains to show how, by good management, through houses can be erected almost as

cheaply as back-to-back houses. Adopting the data supplied by the Borough Engineer of Halifax as a basis, he finds that the estimated cost of the erection of a through house and a back-to-back house corresponding in accommodation, and both complying with the conditions of the by-laws, would be 156*l.* 12*s.* 8*d.* for the former, and 152*l.* 1*s.* 8*d.* for the latter, and the difference in the value of the site would be only 9*s.*, or say 5*l.* altogether. The price demanded for land has much to do with the prevalence of back-to-back houses. On this subject the authors say:—

Taking a general view of the question, we find that the prices paid for land on which houses of the classes under consideration are built range from 4*l.* to 13*s.* 6*d.* per square yard, or at rates varying from 86*l.* 11*s.* 8*d.* to 3,267*l.* per acre. So far as our own observations have gone, it appears that back-to-back house construction is more prevalent in those districts where the price of land is highest. We have already shown that it is possible to erect through and back-to-back houses having fairly sufficient open space about them on what is virtually the same amount of land, but, in practice, the huddling of houses on area is possible and actually occurs to a much greater extent in the case of back-to-back than of through houses, and this too, in some places, even under the sanction of the local regulations. In the suburbs of certain towns visited, and in some of the open country districts, the land is practically in the hands of individuals from whom it is impossible to purchase any for the purpose of erecting artisans' dwellings at less rates than from 4*s.* 6*d.* to 10*s.* per square yard, or in other words, at the rate of from 1,089*l.* to 2,420*l.* per acre. These exorbitant rates, we are informed, are asked and obtained for land which has a present agricultural value of from 30*s.* to 40*s.* per acre annual rental, and in prosperous times has an annual value not exceeding 4*l.* per acre. Under such circumstances as the above it is hardly to be wondered at that there should be a tendency to crowd houses upon area.

As showing the density, it is found that in one part of Halifax there are from 214 to 282 persons per acre; in Morley the density rises to 285, and in Todmorden to 348. Landowners and building owners have reason to be ashamed of the figures.

The authors of the report recommend, as the general outcome of their inquiry, that the Local Government Board should refuse their sanction to any by-laws which would permit the erection of back-to-back houses, and that they should discourage by all the means at their command the erection of such houses. The proposal is the only way out of the difficulty, and probably the local authorities will gladly acquiesce in it. At present, as we have shown, local boards and town councils are expected to wink at evasions which are against general polity, and by laying down a hard-and-fast line the Local Government Board will put a stop to applications and concessions which bring misery to many people.

#### STAINED GLASS AND WOODWORK.\*

AMONGST the ancient Greeks and the Northern Italians of Renaissance days beauty was adored. Every man who practised a craft was as sure of fame if he followed what we now call a humble one as if he followed a noble one, provided that the articles he made could be endowed with beauty, and that he possessed a certain high degree of excellence. A carpenter, an armourer, a potter, a goldsmith, a lapidary, or a bronzist, was as certain to be famous as a sculptor, a statuary, a painter, or an architect. We naturally know less about the ancient Greeks than about the Italians, though, from Socrates being a sculptor, we hear something of the crafts, and we know that Phidias was not only a sculptor and statuary (and I use the word "statuary" in its proper sense as a worker in bronze), but worked also in ivory and gold. The great Italian artists were almost invariably craftsmen as well—in fact, had begun as craftsmen, and had learned during their apprenticeship precision in the use of tools, and in workmanship, as well as precision in drawing and modelling. As a rule, every youth who wanted to be a painter, sculptor, or architect, was apprenticed to a goldsmith. Brunelleschi, Michel Angelo, and Benvenuto Cellini were all brought up as goldsmiths; one became an architect, one a sculptor and painter, and one a statuary and die sinker; Ghirlandaio got his name from the golden wreaths he made; and Francia, as you may see in the National Gallery, signs his pictures as a goldsmith, while he signed his goldsmith's work as a painter, and, like the French artists of the present day, these artist-craftsmen were often excellent shots and swordsmen as well. One of the absurd things in the present day is the looking down on craftsmanship; a real craftsman can always do something well. If he can invest the article he works at with the highest form of beauty, he is just

as much an artist as he who paints a picture, models a statue, or designs a building.

The best definition of fine art I ever found is in Mr. Ruskin's lecture (second Oxford lecture, 1870):—"Every art being properly called 'fine' which demands the exercise of the full faculties of heart and intellect."

A finely-designed and finely-executed gem is just as capable of raising the loftier emotions as a bronze statue or a marble bas-relief; and, speaking personally, I should be inclined to place the glazier's art next to the divine arts of poetry and eloquence, for, like Timotheus's song, it has "raised a mortal to the skies."

To those who have the passion for colour that some have for music, beautiful coloured glass offers the same feast to the eye as exquisite music does to the ear, and from the fact of glass being transparent it does not appear like a tangible object, but, when lit by the sun, it looks like gems melted into light that bring all heaven before our eyes, and surrounding objects are suffused with its divine harmonies. I think I may say it is the only visual art in which man can emulate, if not excel, nature. In pure loveliness of many colours it exceeds in beauty the rainbow, or the sunset, and appears as if some divine affluence had come from heaven to entrance us. It defies the painter's brush and the poet's pen, though we cannot help feeling that Shelley was the poet most highly sensitive to the rapture produced by the glory of coloured light. In his description of fire he shows an appreciation of the beauty we meet with in stained glass, and did not merely use it as a foil to music:—

Men scarcely know how beautiful fire is,  
Each flame of it is as a precious stone  
Dissolved in ever-moving light, and this  
Belongs to each and all who gaze upon.  
(*The Witch of Atlas*, stanza 27.)

Milton's "storied windows richly dight" only give a flavour to his enjoyment of music:—

There let the pealing organ blow  
To the full-voiced quire below  
In service high and anthems clear,  
As may with sweetness through mine ear,  
Dissolve me into ecstasies,  
And bring all heaven before mine eyes.

The Poet Laureate uses it in the same way:—

And thunder-music, rolling, shake  
The prophets blazon'd on the panes.

This rapture is only produced by a few specimens of stained glass, mostly of the eleventh or twelfth centuries; though perhaps some of the windows of the cathedral at Florence are almost as lovely as those of Chartres, or the aisle windows of the choir at Canterbury. Next to them are some of the Saracen windows; these seem to have been copied in plaster from the pierced marble ones of Sta. Sophia, and from the fact of the substance of the window slabs being thick and the edges of the openings being splayed, you can infinitely vary the effect by moving into different positions. Some most love the suffused light on the splays, but to me the effect is most lovely when I get the bulk of this reflected colour with gleams of the glass through which the sun streams, making them look like different-coloured stars in a halo of glory. Next to these full-toned windows in loveliness are those of fine old grisaille glass, especially when seen towards sunset, and when exposure has converted each quarry of white glass into mother-of-pearl.

The cathedral of Poitiers has windows of grisaille, that I once saw just as the light was fading, and they made me ask myself if anything could be lovelier. After grisaille is some of that glazing which is only translucent, and has been done with onyx or marble, where one lovely pale tint fades into another, and then swells and fades again, "untwisting all the chains that tie the hidden soul of harmony." At San Miniato, Florence, the windows of the choir are glazed with slabs of pavonazetto, and look like glorified tortoise-shell. Besides the genius and labour of man, nature has lent her aid to produce these unsurpassable effects in old glass. She has, by roughening and eating into the surface of the glass, turned white into opal, and by partly overspreading them with dirt and lichen she has converted flat tints into cut jewels. Directly we get stained-glass windows whose forms and colours we can calmly criticise and admire, they fall into the ordinary category of beautiful human works, and to me are far lower in the scale than those that, when illumined by the sun, seem but a shapeless mass of coloured loveliness, which throw us into rapturous adoration, and seem as if they could not have been done by man, but that angels must have been sent from heaven to present us with them, so that we might be at once delighted and thankful.

When we attempt to copy the fine early stained glass, consisting of subjects to a small scale, we barely rise to respectable mediocrity. Supposing we have the old glass to copy from, the failure can only arise from one or more of these causes—want of skill, inferiority of material, or the effects of age. The

\* From the Third Cantor Lecture by Mr. G. Aitchison, A.R.A.

want of skill I cannot speak to, though it is to be supposed. The old glass was mostly done by monks, who devoted their time and genius in this direction as the best service they could render God, and who, consequently, considered that no time, no labour, and no care was too great to make their offering worthy. Such a sentiment we cannot find now and can barely understand. Perhaps I can throw some light on it by a story from "Greater Britain." It is acknowledged in America that no fruit growers can compare with the Shakers in the excellence of their fruit. The author asked one of them how they managed it; he said, "If you love the trees you study them, and you find out what they like and dislike; some like shade, some like sunshine, some like beautiful flowers, some like perfumes. If you make them happy, they give better fruit."

Next, as to material. Scandalous as it is to confess, we are grossly inferior in that, and knowingly so. Any manufacturer of coloured glass would tell you the fact in a moment; he would simply say, "It is not worth my while; make it worth my while and I will do it." And he might even add that, with all our chemical knowledge, and all our skill and appliances, he would undertake to make better glass than had ever been made before. I do not say he could, but he would thoroughly believe he could. Love and patient skill can achieve wonders. The earlier Indian gems were pierced only for a hair, and the instrument seems to have been a twig and some emery. And some of the most heavenly blues of early glass have never been equalled. Theophilus, a monk of the eleventh century, tells us that this blue glass was only to be got "in the ancient edifices of the pagans. Some small vases are also found . . . which the French . . . collect, and some melt the sapphire in their furnaces, adding to it a little clear and white glass, and make costly plates of sapphire, and very useful in windows."

The Romans certainly had not our chemical knowledge nor our appliances, but they may have had greater pride in their skill and greater skill.

The application of science tends to diminish skill, and the object of the manufacturer is to extinguish it. There is a trade proverb, that "No man can make his fortune who has to employ skilled labour." There are many other forms of coloured glass than the full-coloured; that in which the whole tone is light, and the variations in tone and tint are the slightest, is the most charming in effect, like those Italian low reliefs of the Quattrocentisti, where the highest part of the relief is not the eighth of an inch. There are, too, a thousand ways in which different sorts of coloured glass can be introduced to give beauty to windows of every description, and in every variety of building.

Glass, too, offers us a field for recording reminiscences of fine form as well as of fine colour; of form particularly when the window is placed where no direct sunlight comes on to it. Two or three things must always be considered when stained glass is used. You do not want highly-coloured painted decoration, nor that which is elaborately full of work, where deep-toned stained glass is used; this conjunction not only leaves no rest for the eye, but the colour of the dead painting is spoiled by the coloured rays. Nothing goes so well with the most magnificent full-toned stained glass as the greys of old stonework; next, you can no more leave a white window where the bulk are of fully coloured glass than you can put up a white chimney-piece in a room decorated in a full tone; and again, whatever be the tone of the chamber, if the wall decoration be full and elaborate, you only want enough work on the glass to suggest intention. You must not suggest want of completion, but merely the studied absence of ornament to give effect to the elaborated parts. Greek work is absolutely perfect in this respect; it says to you, "My author did not leave me plain for want of industry or skill, but because he considered by doing so he showed that highest skill of knowing when and where to stop." In the best Saracen work a similar effect is got—though, in my opinion, a lower one—by gradation. All is ornamented, but in the general effect the lighter ornament appears as mere texture, if not as a plain surface. The Saracen does not take so lofty an intellectual position as the Greek, for he either mistrusts his own judgment or yours; by going close enough you can see he has worked, while the Greek says, "Raise yourself to my standard, and you will then understand the value of this elaborate plainness."

There is one very comic belief that is applicable to stained glass, as it is to all the arts that combine the useful and the fine; persons who cannot draw on paper think they can on glass, or on pottery, or on silk, and persons who are more or less colour-blind think the same about colour. If foremen of house-painters are not chosen for this defect, their employers certainly look on it as a most pardonable weakness. I may add, too, that the art of drawing, modelling, or designing form, by no means confers the gift of colour on its possessor; many have this charming faculty of harmonising colour who cannot draw. In fact, the highest excellence in either, if not antagonistic to the other, is exclusive by predominance. The Tuscans were specially formists, while the Venetians were colourists. We should not go to Michel Angelo or Raphael

for colour, nor to Titian or Tintoret for form, though both schools are passable in the opposite gift. If a painter is not a colourist, he should change his occupation, for if the colour of his pictures is vile we do not look at them, while if the colour is superb we may at last study the form.

I think we may claim a new departure in stained glass, for some of Mr. Burne Jones's windows in Oxford Cathedral are both new in treatment and beautiful as well. In one of Mr. Ruskin's lectures he confirms the theories I ventured to uphold in my first lecture. In speaking of the windows at Chartres, he says:—"We profess that this is to honour the Deity, or, in other words, that it is pleasing to Him that we should delight our eyes with blue and golden colours. . . . I do not think it can be doubted that it is pleasing to Him when we do this, for He has Himself prepared for us, nearly every morning and evening, windows painted with divine art, in blue, and gold, and vermilion; windows lighted from within by the lustre of that Heaven which we may assume, at least with more certainty than any consecrated ground, to be one of His dwelling-places."—(Oxford lecture, p. 81.)

The arts of the carpenter and the potter are two of the oldest in the world. As soon as mankind wanted boiled food they had to invent something to boil it in, though probably the process was inverted, and when they got something that would stand heat and hold water, they took to boiling their food. Shells were doubtless used as the first drinking cups by those living by the seaboard, and calabashes by those inland, and we still find gourd-shaped bottles, with the double bulb, in the pottery of the East; the hafts of weapons and tools were probably the first specimens of the carpenters' art; then came the carved club and the javelin, subsequently the canoe, so aptly called by the Americans a "dug out," and the paddle. Framed huts of wood must have been a late invention, and doors and shutters a still later one.

Nature always makes her works fitted for their end, and when she likes, and she mostly does like, perfectly beautiful as well. So long as mankind were in constant contact with nature's works they tried to imitate her methods, but at last they discovered that this involved two processes. So that when they ceased to care for beauty they grudged the necessary labour to attain it. It is a million to one against a thing made by man, with no other end in view but utility, turning out beautiful.

Though ornamenting wood with incised or carved patterns was probably an early invention, it was no easy thing to mould it; hence the belief that the original Greek eaves of wood were first covered with ornamental terra-cotta, which was subsequently copied in stone. In speaking of woodwork, it is necessary to describe the material, and the way of putting it together. The thickest tree trunk is rarely wide enough to make a door of the centre plank, and even if it were, it is apt to crack and twist as it gets dry. To get over these difficulties boards enough were laid side by side, and fastened together by planks on the back at right angles, but this shows a series of parallel lines, either vertical or horizontal; the next step was to frame a thick skeleton, and fill in the open spaces with thinner pieces called panels. All that sort of woodwork that is called framed joinery practically comes to this, though some races have preferred putting all but the outside framework at acute angles; the best known specimens of this method are to be found in Saracen and Japanese work. The abrupt step from the plane of the frame to that of the panel was softened and beautified by moulding, and, except by different treatment of the width, thickness, and curvature of the mouldings, there is no way of bringing plain framed woodwork into the realm of art but by proportioning the panels and framework harmonically; we can then engrave or incise the whole or parts, or we can carve them into patterns or into figures. Wood has a small range of colours, white, yellow, red, brown, purple, and black, and a great variety of tones and tints in these colours, and we can still more vary the tints by oils, resins, and gums. Dragon's blood is much used for staining mahogany, rose, and other woods that are reddish by nature, or are wanted to be so, and is now known to be the resin from a palm, and was one of the Greek cinnabars, the other being vermilion; but Sir John Mandeville, in his "Travels in the East" (1322-56), gives an account of how they hunted the dragon for his blood. Few woods stain well except in small pieces, and when stained are mostly used for inlays. Woods are sometimes variegated, usually marked by stripes, veins, curls, or dapples. As the mind of man is greedy of novelty, we admire that to which we are unaccustomed, and often imitate a choice wood by painting a common one. In France they sometimes grain oak to imitate deal, while we grain deal to imitate oak.

Wood may be inlaid with other woods, with bone, ivory, tortoise-shell, mother-of-pearl, and other shells, with metals, with marbles, with precious stones, with glass, pottery, china or enamel, either plain or in patterns. Living as most of us do in hired houses, we hardly think of anything but painted deal, the painting being renewed every few years, according to the caprices of fashion. Modern inlaid woodwork most of us have never seen; what we take for it is marquetry—two veneers of

different colours cut into the pattern wanted, and one fitted into the other, and the whole glued on to a backing. Inlaying is sinking out the solid wood and letting in pieces of other coloured materials, and requires much greater care and skill than marquetry. There are said to be only five men in England who are first-rate at marquetry, and that most of them are foreigners. The main merit of real inlay is this—that at the worst the inlay can but come out, while veneer, if it gets damp, or if the glue gets too dry, comes off bodily. Very few people appreciate the value of hard wood, which has the incidental merit of not bruising so easily as soft; but its main merit is preserving the decorative colour originally designed, and that it can be inlaid, or if carved is not spoiled by successive painting. Oak is mostly our highest ambition; the Mediævals and the people of the last century were quite right to plaster and paint, or to gild it, for new oak is one of the vilest colours—a sort of cross between cold veal and a top-boot. If not French polished, it may get a decent colour in the days of our great-grandchildren, though when new it does not make a bad background for inlays of ebony, other coloured woods, and ivory. Spanish mahogany also looks well when it is about a century old, and is then a blackish purple. For dignity nothing is so serviceable as ebony, or wood stained black. Ebony varying from black, through brown to yellow, or through grey to black, has the inestimable advantage of variety, which dyed wood mostly wants. In this respect it is like real black marble, that is rarely without variations to grey or brown, and more often than not has white flecks or veins in it, so that you do not mistake it for enamelled iron or slate. The marquetry of floors may be equally well inlaid in patterns, only it wants to be done on a larger scale.

For the necessary woodwork of a building, exclusive of furniture, little turning is required, except for balusters. Turning is a cheap means of contrasting two or three simple forms, the square, octagon, &c., with the round, and getting harmonic proportions in the round; for the architect has to follow the example in the Eton Latin Grammar, "*Mutat quadrata rotundis*"—a great part of his art is in changing shapes from square to round. There is another method of enriching woodwork that I have omitted, and I hardly know where it originated or who carried it on—probably the Milanese; but you find abundant specimens at Venice, sometimes in doors, but oftener in picture and mirror frames, and in cabinets. The mouldings are mostly original, bold and striking, containing all the necessary variety of width, curvature, and projection; the mouldings are occasionally, and the flat surfaces are always, enriched by slight variations of surface that may almost be called textures, such as basketwork, minute beads (in the carpenter's sense) of various altitudes, often forming a meander; sometimes a sort of magnified pile is used, and the colour is nearly always black. These enrichments are still made here by colonies of foreigners in the back streets about Rathbone Place. Our manufacturers seize with avidity on the few patterns that are coarse, ugly, or vulgar; you can find plenty of them on expensive pianos. The Saracens, mostly inhabiting hot countries where both air and privacy are wanted, made great use of turned-wood lattice-work of an infinite variety of patterns where the close and the open were contrasted, not unfrequently containing texts from the Koran, and these again contrasted with the solid. The Chinese and Japanese, instead of ephemeral painting, use lacquer mostly of dark colour, from aventurine to black, and enrich it with gilding or colour, or with the low reliefs in gold-coloured lac; the metals, ivory, mother-of-pearl, and precious stones are often inlaid, and are frequently carved and raised above the surface. The Chinese and Japanese, having once been colourists, occasionally furnish us with old lacquer in low tones that is superb. Considering how the Japanese have taken us captive by their art, it is surprising that so little use has been made of late of their fine lacquered panels; but unless we can emulate the cheap broom seller, who stole his brooms ready made, we either have not wit or industry enough to avail ourselves of that which would give piquancy to our designs.

Mr. Ruskin is not complimentary to our age, for he speaks of it in his Oxford lecture as "An age without honest confidence enough in itself to carve a cherry stone with an original fancy, but with insolence enough to abolish the solar system, if it were allowed to meddle with it."

Some of the Chinese black lacquered ware, inlaid with gold and black mother-of-pearl, is as beautiful as Labrador spar, and I have seen black lacquered Indian cabinets of large size, inlaid with squares and patterns of black mother-of-pearl, that are more gorgeous in colour than anything but fine stained glass.

To some extent it is the duty, as well as the inclination, of a lecturer to find fault, when he is not a mere expounder of facts. We naturally do not need improvement if we are perfect, but if we are not perfect in those matters of which the lecturer treats he is not doing his duty if he does not find fault. Epictetus put this very well when he spoke of persons going to a physician. One has a fever, one an ulcer, one a dislocated

shoulder. If the physician merely dismisses them with soft words they are, at first, pleased; but each takes away the malady he brought. But if the physician be a good one, he gives nauseous physic to the one, cauterises the second, and puts the third to agony by setting his shoulder. I think persons in the present age lack the cultivation necessary to desire good workmanship and beauty, and consequently take their pleasure in lower and less ennobling ways than nature intended; but I do not think it extraordinary.

The savage who first tied a sharp stone in a cleft stick wanted to kill his enemies and secure his prey at once. As he got security, leisure, and affluence, he shaped his weapon and ornamented it.

Our acquisitions have been the use of steam, of electricity, and of iron, on a grand scale. The application of the former in the steam-engine is more than equivalent to the labour of millions, and has enabled us to partially annihilate time and space. The rush to yoke these dragons to our cars, and to gain wealth beyond the dreams of avarice, has made us blind to the necessity of noble leisure, of beauty for our enjoyment, and for the perpetuation of our name. Even now we are like Alexander, weeping for more worlds to conquer, when we have not yet conquered ourselves.

Many of the thoughtful are of opinion that the time is approaching when this wondrous application of science to the arts of life which has so completely revolutionised the world has nearly come to a close. If this be the case, and if we have not lost our energy, it will be exercised in again studying the beautiful in nature, in again beautifying what we have, and in perpetuating those evanescent beauties of our day, and those noble thoughts, actions, self-denials, and sufferings which are inseparable from humanity at great epochs of virtue.

If this be so, we may look to another golden age of the fine arts, which may, I hope, excel, and which I have no doubt will excel, those golden ages which have left some of their masterpieces for our instruction, admiration, and delight.

## TESSERÆ.

### Vandyke's Painting.

J. NORTHCOTE.

WHEN Richardson was a very young man, in the course of his practice he painted the portrait of a very old lady, who, in conversation at the time of her sitting to him, happened to mention that when she was a girl about sixteen years of age, she sat to Vandyke for her portrait. This immediately raised the curiosity of Richardson, who asked a hundred questions, many of them unimportant. However, the circumstance which seemed to him, as a painter, to be of the most consequence in the information he gained was this: she said she well remembered that at the time when she sat to Vandyke for her portrait, and saw his pictures in his gallery, they appeared to have a white and raw look in comparison with the mellow and rich hue which we now see in them, and which time alone must have given to them, adding much to their excellence. Of the truth of this anecdote I am well convinced from my own experience, as before I came to London I had seen no others of Sir Joshua's paintings than those which had been mellowed by a considerable space of time, which had given them a richness of hue, so that when I first saw his gallery in London I well recollect my surprise and disappointment at the sight of the raw, crude, fresh appearance of his new pictures, which, from these causes alone, seemed to me by no means equal to those I had before seen and so much admired.

### Vitruvian Canons.

E. AIKIN.

Of what nature were the systems of architecture of the Greeks is a question which naturally presses on our curiosity when we hear of the written works of a long list of architects, whose names alone survive in the works of Vitruvius. The authority of the last-mentioned author I am not inclined to rank very high, as his precepts are in general contradicted by extant remains; we may, however, conclude, from his manner of teaching the art, that the ancients proceeded on very different principles in the execution of the orders from the moderns. Thus Vitruvius directs us to vary the proportion of the members according to the magnitude, situation, purpose, and other circumstances of the building; while modern authors offer no rules of that kind, but prescribe a certain fixed modulation of the parts of each order, to be used in all edifices, however circumstanced, each author recommending such as his peculiar studies have occasioned to make a favourable impression on his mind. The columns of areostyle temples, says Vitruvius, are eight diameters in height; those of a diastyle intercolumniation, eight and a half; those of systyle, nine and a half; of pycnostyle, ten; and of eustyle, eight and a half; and these he directs without any modification for the different orders,

though in a subsequent part of the work each order has its particular proportions assigned. That the ancients were also guided by minute optical considerations is rendered probable by another passage respecting the diminution of columns, which is directed to be varied according to their altitude; thus, in a column of 15 feet high, the diameter at the bottom is to be divided into six parts, and five given to the diameter at the top; if the column is from 40 to 50 feet in height, the bottom diameter is to be divided into eight parts, and seven given to the top. Several intermediate proportions are mentioned, and if it is still higher, the same principle is to be observed. The reason assigned for this is, that as a greater height causes the column to appear more diminished, this appearance is to be corrected by an additional thickness, beauty being the province of the eye, which if not satisfied by the due proportion and augmentation of the members correcting apparent deficiencies with proper additions, the aspect will appear coarse and displeasing. The columns at the angles of the porticoes are also directed to be made one-fiftieth part of a diameter thicker than the others, because they being more surrounded by the air, will appear slenderer, and the deficiencies of the sight must be rectified by the judgment. This last practice is confirmed by the example of the Temple of Minerva at Athens. In another part, Vitruvius gives an extraordinary direction, for which it is not easy to conceive a reason; that the columns of the side porticoes of a temple should be so placed that the inner line of the shaft may be perpendicular, thus leaving all the diminution on the outside. This is observed in the Temple of Vesta at Tivoli, and perhaps in no other antique example.

#### The Theory of Structures.

W. J. M. RANKINE.

Strictly speaking, all machines are structures, though all structures are not machines; but it is convenient to limit the term structures to those combinations of solid materials whose parts are not intended to have relative motion, and which are thus to be distinguished from machines, whose parts are intended to have relative motion and to perform work. The theory of structures is founded on the principles of statics or the science of equilibrium. It is divided into two parts, relating respectively to the two requisites of a structure, stability and strength—stability being the power of resisting forces tending to overthrow the structure, or to derange the parts of which it is made from their proper relative positions; and strength, the power of resisting forces tending to alter the figures of those parts or to break them in pieces. For example, in a bridge stability requires certain relations to exist between the distribution of the load, the figure of the arch, and the dimensions of the abutments, in order to prevent the dislocation of the arch-stones or the overthrow of the abutments; and strength requires the arch to be of a thickness sufficient to resist the tendency to crush it. In applying the principles of stability and strength to structures, regard must be had to the special properties of the materials employed, whether earth, stone, bricks, cement, timber, iron, or other metals, as well as to the kind of workmanship to which each material is subjected and the forms in which it is used. The end to be aimed at in every scientifically designed structure is to adjust exactly the position, form, and size of the whole and of each part to the forces which it has to sustain. The more nearly this end is attained the better will the structure be, not only in efficiency, durability, and economy, but also in beauty. This, independently of ornament, is the fundamental principle of beauty in architecture as well as in engineering.

#### Defective Planning in London.

J. H. BRIDGES.

Let us compare some simple social states with others that are less simple. Let us look at a peasant proprietor in a French village, or at a healthy squatter far away among the gum-trees in Australia. The contrast between their life and that of the dwellers in large towns might, for many purposes, be summed up in two epithets borrowed from geometry (and you know modern mathematics are capable of explaining everything). It might be spoken of as the vertical state as opposed to the horizontal. Remark that to the colonist it is of comparatively little importance what his neighbour or the rest of the world do. His food comes to a great extent vertically upwards to him from the ground; water comes vertically downwards to him from the sky. His clothing, whether of wool, or flax, or skin, grows on the spot; his house is built from a quarry in his field, or from logs in his own bit of forest; the refuse from his house and person is buried in the soil, and so on. Contrast all this with the horizontality, so to speak, of town arrangements. Water is brought from reservoirs twenty or fifty miles away; food comes from farms miles distant, perhaps from the other side of the Atlantic, or from the other side of the Pacific; clothing from any part of Europe or Asia. As for refuse substances, no vertical removal of them is possible; complicated labyrinths

of tunnels, arterial systems, pumping-stations, sewage irrigations, Acts of Parliament, and what not, have to be instituted to prevent us from poisoning one another. Think again of all the horizontality implied in highways, railroads, and telegraphs. I would not strain my geometrical metaphor further than it will bear. Dwell on one more aspect of the same subject. Think how much historical phenomena have to do with the matter. For good or for evil, for good infinitely more than for evil, but yet for evil also, we have to bear the burden of the past. The treasures are mixed with dross. Take the single instance of house provision. A squatter in the bush can build his house where he likes, he has hill and vale to choose from; but a house commonly lasts longer than a man, and in towns we have to choose from the houses provided by other generations. Put yourself in the position of a workman who must live near his work. Think of the structure of London between Regent Street and the Tower—I speak of the courts, back streets, and lanes. They are much more interesting than the lanes of Venice; and then ask the question, How much of all this is due to the intolerably bad domestic government of England from the restoration of the Stuarts down to, let us say, the reign of Dr. Chadwick, thirty to forty years ago? Think how it would have been if London, after the Fire, could have been rebuilt under the eye of Cromwell, instead of the unholy brood who for a whole generation threw England to the dogs, and whose mere names, were it possible, we would forget! Then follow the growth of London into the next century by the light of Hogarth's pictures—take the one picture of *Cruelty*, for instance—and think how very little forethought might have changed the growth of St. Giles's, Bloomsbury, or St. Anne's, Soho. And then when, by reading, and also by ocular inspection, you have become familiar with the anatomy and physiology of a London court, including the embryology of it, that is, the way in which it arises, under the motive power of high rents, by the simple process of building rows of small houses at the end, and ultimately at the sides, of back gardens, the wind from each one of the four quarters of the sky hermetically shut out, and the ignorant greed of the builder uninterfered with by wisdom or by policemen of any sort or kind; then, I say, when the lesson has been well learnt, go to Hackney or to Stratford, where new London is ravaging the green fields rapidly, and ask how far is the next generation to be compromised by what the speculative builders are doing there at this moment? and compare the rate of velocity of their proceedings with that of Sir Sydney Waterlow's most admirable building society or of the Peabody Trustees.

#### The Theory of the Arch.

W. H. BARLOW.

The supposition of the existence of a certain curve or line, in which the pressure is transmitted throughout the voussoirs of an arch, is not of recent origin. The theory of equilibration, called the catenarian, of which an account is given by David Gregory ("Phil. Trans." 1697), is founded on this basis; but throughout the investigation it has been assumed necessary to make the line in which the pressure is transmitted coincide precisely with the form of the intrados of the arch, a condition which is necessary to stability only when the arch is infinitely thin. In the theory promulgated by La Hire and Attwood, familiarly known as the wedge theory, or that in which each voussoir is supposed to act as a wedge, it is considered necessary that the pressure should be transmitted, so that the direction in which it acts at each joint should be at right angles to the surface of contact, which condition is only necessary to stability when no friction exists between the surfaces of contact of the voussoirs. But when the thickness of the arch and the friction at the surfaces of contact of the voussoirs are both included in the investigation, it has been shown by Professor Moseley, in his able and elegant exposition on this subject, that the two conditions above mentioned become modified, and that in an arch of uncemented voussoirs the actual requirements to establish stability are:—First, that the line in which the pressure is transmitted (which he has named the line of resistance) should fall within the thickness of the arch at every joint; secondly, that the direction of the pressure at each joint should be within certain limits, depending on the friction of the materials employed. Coulomb, the first writer on this subject, who based his assumptions on data consistent with practice ("Mémoires des savans étrangers," 1773), considered, with Moseley, that there were two causes of rupture; the first arising from the turning over of certain parts of one voussoir on the edges of another; and the second from the slipping or sliding of the voussoirs on each other; and although the mode of investigation pursued was totally different, yet the results present a complete accordance with those since arrived at by Professor Moseley, so far as they embrace the same elements of discussion. This remark applies also to the catenarian and the wedge theories; for if the thickness of the arch be considered to be infinitely small, the line of resistance becomes the catenary, and if the

thickness be retained and the friction omitted, the line of resistance is analogous with the line of pressure as determined by Whewell in the wedge theory; but though the investigations of Moseley leave little to be done in elucidating the conditions of stability in arches mathematically, yet the deductions have not received that attention from engineers which their importance deserves, chiefly from the absence of any decided practical exhibition of their correctness and utility, and also from the investigation being surrounded by too much mathematical difficulty to admit of ready application. The analogy before-mentioned, as existing between the line of resistance, the catenary, and the line of pressure of the wedge theory, arises from one governing principle, which is general in these curves, and constitutes the essential element of equilibrium when the only force acting is gravity, namely, that the horizontal forces in any part of the curve are equal to each other—by which it must be understood that not only must the horizontal force at any part of the curve be opposed by a horizontal force of equal amount in the opposite direction, but that the horizontal force is equal throughout the curve. This essential element of any curve of equilibrium though probably known, has not been pointed out. Its mathematical correctness is self-evident, and it will be found that the limit of stability is when the point of contact of any two voussoirs falls at their outer or inner extremities, thus establishing practically that the line of resistance, or curve of equal horizontal thrust, must be contained within the thickness at every joint. The second condition necessary to stability, namely, that the direction of the pressure at each joint should be within the limiting angle of friction, is almost always of necessity fulfilled in the forms of arches, and with the materials usually employed in practice. This part of the inquiry will therefore be confined to the first condition. Now, the property of equal horizontal thrust enables a geometrical construction of the curve to be readily obtained in any given form of arch if two points in the curve be given, and by assuming these two points it can be ascertained by a tentative process if any given arch does or does not contain the curve. Proceeding in this manner, it is found that in a semicircular arch the thickness must be one-ninth of the radius to contain the curve, a result which is completely borne out in practice; for, though apparently unnoticed, a semicircular arch cannot be made to stand without foreign support unless the thickness be greater than one-ninth of the radius. In like manner, in any other form of arch which does not precisely coincide with the curve of equal horizontal thrust, there is a certain minimum thickness, or depth of voussoir, necessary to obtain stability.

#### The Greatness of Classic Architecture.

T. L. DONALDSON.

The architects of Greece and Rome lived in periods when art in those countries was at its culminating point—when men of the most cultivated minds, and of the highest intellectual status in such departments, were engaged in discussing in the schools the laws of taste and the utmost refinements of thought. They laid down the laws of proportion with exactness. The sister arts of sculpture and painting were most refined, and the masterpieces of the highest genius were produced. Neither the one nor the other was obliged to depart from the truthfulness of nature, in order to conform to the arbitrary peculiarities of architecture. Our own eyes see that the works of Phidias, Scopas, Bryaxcis, Timotheus, Leochares, and Pythis were as full of all the just proportions, native grace, and artless *posé* as if the living subjects themselves had assumed the positions in which the sculpture is grouped, and as if the statues were intended for independent purposes. Those artists worked for an intelligent people, and had not to seek adventitious means to make their works come home to the convictions of the multitude. No contortions of form. No excess of expression. The poetic fancy of the artists had its limit, and did not run wild. The sacred edifice did not admit the caricature of sacred subjects, but maintained a tone of feeling and thought removed from everything that was lowly, familiar, and debasing. No masked efforts in point of construction. It is amazing to think that Classical art, with all the magnificent remains we have of the genius of the ancients still existing, should be put upon its trial in England. It is true that the monuments are in ruins, that the completeness of their original state, with all their appropriate accessories and the maintenance of their actual use in our times, do not exist, as in Mediæval buildings; and that the fulness of Greek art is, to a degree, an abstraction, and can only be appreciated by those who have lovingly and profoundly studied the subject, and by so far it stands at a disadvantage with more recent phases of taste. But with such a standard of purity as that revealed by the monuments of Attica, of Asia Minor, and of Rome, not to mention the provinces enriched by the reflex of glory that shed its halo on such ruins as those of the south of France, and in Sicily and Pompeii, a school cannot wander far from the true path unless in ignorance it rejects all antique tradition. It must be an im-

patience of wholesome control, a disregard for sober authority, a wild license of thought and passion for novelty, that would disregard the rich inheritance of the influence of Classic taste, to cripple and destroy which is an act of barbarism and folly, an audacious attempt to throw back civilisation, a high treason against good sense. For their temples, which are the highest expression of art in any people, as being dedicated to the Deity, and coincident with the deepest feelings of devotion in the heathen mind, were objects worthy the acceptance of the Divinity. They were eminent in conception, choice in every detail, superb in embellishment, calculated to excite feelings of reverence and awe; stupendous as to size, striking as to position.

#### Tone in Painting.

J. RUSKIN.

I understand two things by the word "tone": first, the exact relief and relation of objects against and to each other in substance and darkness, as they are nearer or more distant, and the perfect relation of the shades of all of them to the chief light of the picture, whether that be sky, water, or anything else; secondly, the exact relation of the colours of the shadows to the colours of the light, so that they may at once be felt to be merely different degrees of the same light; and the accurate relation among the illuminated parts themselves, with respect to the degree in which they are influenced by the colour of the light itself, whether warm or cold; so that the whole of the picture may be felt to be in one climate, under one kind of light, and "in one kind of atmosphere," &c. The finely-toned pictures of the Old Masters are remarkable for the truth of their proportionate differences, and, though the key-note be far below nature, they are remarkable for the correctness in this respect—the finely-toned pictures of the Old Masters being two or three octaves below the key of nature, but the dark objects in the middle distance having precisely the same relation to the light of the sky which they have in nature, but the light being necessarily infinitely lowered, and the mass of the shadow deepened in the same degree. Now Turner starts from the beginning with a totally different principle. He boldly takes pure white (and justly, for it is the sign of the most intense sunbeams) for his highest light, and lampblack for his deepest shade; and between these he makes every degree of shade indicative of a separate degree of distance, giving each step of approach—not the exact difference in pitch which it would have in nature, but a difference bearing the same proportion to that which his sum of possible shade bears to the sum of nature's shade, so that an object half-way between his horizon and his foreground will be exactly in half tint of force, and every minute division of intermediate space will have just its proportionate share of the lesser sum and no more. Hence, where the Old Masters expressed one distance, he expresses a hundred; and where they said furlongs, he says leagues. Which of these modes of procedure be most agreeable with truth I think I may safely leave the reader to decide for himself.

#### Effect of Time on Slaked Lime.

M. FARADAY.

Led by the statement that the keeping of the lime in a slaked condition for a couple of years is a great advantage to it, I took some specimens from the stores which have been so laid up at the Houses of Parliament, for the purpose of examining them in this respect. It appears to me that this lime (which is in a state of paste) is in a very soft and smooth condition in comparison with what would probably be the condition of the lime recently slaked, a condition which seems to be due to its thorough disintegration as a mass, and its separation particle from particle. On analysing it I found that it contained a little carbonic acid, but not much, for in 100 parts of the dry substance there were but  $5\frac{1}{4}$  parts of carbonic acid; these 100 parts, therefore, would contain 88 parts of quick or uncarbonated lime, and 12 parts of carbonated lime, which, considering the processes of burning, carrying, slaking, &c., that it had to go through, and the necessary time of exposure to air before it was laid up in store, is a very small proportion. I do not believe that the lime, which is more than 4 inches from the exterior, has received any portion of carbonic acid during the two years of its inhumation. In respect of the effect of keeping lime for a time, I am led to think, without however having formed any strong opinion on the subject, that the benefit is due to the fine texture which it gradually acquires; and as there is no doubt that if two surfaces were prepared, the one with fine sand and lime in particles comparatively coarse, and the other with the same kind of sand and lime in particles comparatively far more perfectly divided, that these two would act very differently both as to the access of carbonic acid from the atmosphere and the transition of lime dissolved in the moisture of the mass from the interior towards the surface; so there is every reason to expect that there would be a difference in the degree of action upon the colours at that surface, and also in the time at which that action would come to a close.

## NOTES AND COMMENTS.

FEW can boast of having an acquaintance with the mysteries of heraldry, although at one time the science was comprised in the education of a gentleman. Is it not therefore rather ridiculous for the town councillors of Bath to set up as authorities on the subject? Major DAVIS, their surveyor, is an archæologist of note, and when he commits himself to a conclusion relating to a coat of arms, it might be assumed that he was not acting rashly, for an error in heraldry is more grievous with an archæologist than a false quantity in scholarship. The two essays by Major DAVIS on the Arms of Bath, which we have published, denote the pains the architect has taken in order to elucidate an obscure problem. But the worthy councillors have a preference for one coat-of-arms regardless of all that heralds may say against it, and Major DAVIS's researches are set aside. Application was made to the Somerset Herald, and he arrived at the same conclusion. The council have since resolved to appeal to the Duke of NORFOLK. As the taxpayers will discover, it is impossible to put the Herald's College in motion without paying at a rate that is proportionate to the importance of heraldry. But, meanwhile, the arms which Major DAVIS removed are to be set up again with all their absurdities, in order, we suppose, to teach a lesson to reformers about the perfectibility of corporations.

THE new post-office in Brussels, near the Théâtre de la Monnaie, is sufficiently advanced to enable a spectator to form an idea of its value as a work of architecture. It will be a noble addition to that part of the city. The architect, M. DE CURTE, insisted on full-sized models of the sculpture being placed in position before the commission to execute the figures in stone was given. It was found that the caryatids representing Commerce and Industry were not effective, and alterations will have to be made in them. The two groups of *The Post* and *The Telegraph* also seem to be too large in scale for the building. There will be no difficulty in modifying the sculpture, and credit is due to M. DE CURTE for insisting on his rights as the architect to have control over the subsidiary arts. Too often the sculptors follow their own will, and are indifferent to the relation which should subsist between their figures and a building.

THE Louvre has lost an able officer by the death of M. DE TAUZIA, who had charge of the department of drawings and engravings. He was often employed in missions for the acquirement of works of art, and, as M. DE TAUZIA belonged to a noble family, he was sure of a friendly reception in the most select circles of foreign countries. Several important works were acquired by him, among others two frescoes by BOTTICELLI, which are familiar to visitors to the Louvre. M. DE TAUZIA carried out most of the arrangements for the gallery of nineteenth-century painting and the gallery devoted to portraits of artists.

MR. THOMAS HAWKSLEY, the hydraulic engineer, who, although over eighty years of age, is still able to design and conduct works of importance, has been defeated in an action which turned on a question of joint responsibility. For thirty years Mr. HAWKSLEY has held the office of consulting engineer to the city of Oxford, and in 1880 he recommended one of his assistants, Mr. BURSTAL, to the Council as resident water engineer, at a salary of 400*l.* a year. Soon afterwards it was decided to construct filtering beds, and preliminary plans were drawn by Mr. BURSTAL, and levels were taken by him, but, apparently, little use was made of these plans by Mr. HAWKSLEY, who had plans prepared and sections taken by his own assistants. When the works were undertaken the question was what was Mr. BURSTAL's position? According to Mr. HAWKSLEY's view, that gentleman was supposed to be the resident engineer who was to carry out Mr. HAWKSLEY's designs. But was he to have any share in the 5 per cent. allowed for engineering expenses? Mr. HAWKSLEY says he had never a partnership of the kind, although he had given gratuities to local engineers who had rendered him assistance. He had also objected to an entry by which Mr.

BURSTAL was described as joint engineer, and although the word jointly was put down, for want of a better word, by the town clerk, the Town Council resolved that Mr. HAWKSLEY was to bear the whole responsibility. The Mayor of Oxford and the Water Committee were desirous that Mr. BURSTAL should have some share of the commission, but others were indifferent. Mr. BURSTAL claimed two-fifths of the 700*l.* received by Mr. HAWKSLEY, and on the direction of the Lord Chief Justice his claim was recognised. His lordship considered that originally Mr. BURSTAL was to have sole charge of the works, but that afterwards the Council desired to have the co-operation of the two engineers. The case is one among many where honourable men get to loggerheads because they will not take the trouble to define their positions by writing. Mr. HAWKSLEY believed that Mr. BURSTAL resembled many another resident engineer, whose duty it was to be a sort of clerk of works and carry out his wishes. Mr. BURSTAL, on the other hand, considered himself to be joint engineer with Mr. HAWKSLEY. So long as no more than 5 per cent. was paid, the committee and Town Council were indifferent to the status of their officer, or whether Mr. BURSTAL received the whole commission or none of it. The case is a warning against trusting over-much, for as it turns out, Mr. HAWKSLEY will receive less than 100*l.* for all his work, and he will have to pay all the law costs.

M. JEAN PAUL LAURENS has completed the painting for the ceiling of the Odéon Theatre in Paris. A great crowd of figures symbolic of human passions, some of them being 10 feet in height, are represented as descending through openings of an antique vallum. Beneath are statues of MOLIÈRE, CORNEILLE, RACINE and BEAUMARCHAIS, with busts of VICTOR HUGO, BALZAC, DUMAS, MUSSET and other dramatists, while medallions of GEORGE SAND, HENRI MURGER and others are attached to the columns which appear to support the vallum. The commission for so important a work is a fresh sign of the great enterprise of M. POREL, who, in the forthcoming season, intends to surpass his previous efforts.

A VOTE of 78,000 francs has been passed by the Paris Municipality for the erection of a pedestal on which the reduced copy of M. BARTHOLDI's statue of *Liberty Enlightening the World* will be placed. The statue is a gift from the Americans in Paris, and will be erected near the Pont de Grenelle. The site will allow the statue to be well seen, but the most fitting place for such a work would be before one of the great railway termini.

THE announcement of a competition for Municipal Offices in New York attracted a great many designs, although one of the conditions was that the unpremiated designs should become the property of the authorities. The examination of them was entrusted to Mr. R. M. HUNT, Mr. UPJOHN, and Professor WARE. The judges advise that the first and second prizes should be withheld. As a design by Mr. C. B. ATWOOD is supposed to come nearest to the requirements it is recommended for adoption, but if not pleasing to the authorities the sum of 2,000 dollars should be paid to the author. A prize of 3,000 dollars is awarded to Mr. R. N. CRAWFORD; one of 2,000 dollars to Mr. A. P. CLARK, jun.; one of 1,000 dollars to Mr. J. A. STARK; and an extra prize of 1,000 dollars to Messrs. WESTON & TUCKERMAN.

A MEETING of masters of schools of art was held on Wednesday and (by adjournment) on Thursday, in the Lecture Theatre of the South Kensington Museum, to form an association representative of their interests and of the interests of art education. About sixty gentlemen attended from all parts of the kingdom, and a Society was established to be called the Society of Art Masters. Mr. EDW. R. TAYLOR, of Birmingham, was appointed chairman for the ensuing year; Mr. ALEX. FISHER, of Brighton, vice-chairman; and Mr. FRANCIS FORD, secretary. Membership is limited to holders of an art master's certificate (third grade) from the Department of Science and Art.

## ILLUSTRATIONS.

NOS. 192-194 OXFORD STREET.

IN this design the architect has been able to exhibit the value of good permanent colour in the shape of granites of various tints with red stone and brickwork and Portland stone all combined, so as to produce a harmonious and yet lively composition of coloured materials. The bases of pilasters are of Shap and the pilasters of Alford grey granite. The angle is of red Peterhead granite, while the architraves and window dressings are of the delicate grey granite known as Bessbrook. The main entablature is of Dyce grey and Corrennie pink granite, all highly polished. The red stone is from Warmanbie quarries, and is used in the carved caps of larger pilasters, and in the tympanum, &c. The carving of panels (with the C. B. & Co. monogram in centre) was executed by Mr. AUMONIER, and is similar in idea to the Renaissance work seen at Blois and elsewhere. The builders are MESSRS. DREW & CADMAN, Holborn, and the architect Mr. CHAS. FORSTER HAYWARD, F.S.A., of 47 Museum Street, W.C.

## HOUSES, METHLEY.

THESE houses, which have been recently completed at Methley, for Mr. T. BRAINE, give on the ground floor two sitting-rooms, hall, kitchen, with cellars in basement, and on first floor three bedrooms, landing and bath-room; in the rear of the houses are placed washhouses and offices. The walls are of red brick with stone dressings and timber gables. They have been completed in a most substantial manner, at a cost of 680*l.*, by Mr. P. RHODES, of Leeds, from the designs of Mr. T. BUTLER WILSON, architect, of Leeds and Harrogate.

## HOUSE, SHOP, AND SMITHY, HEADINGLEY.

THESE premises are built of pitched-faced stone with Burley dressings, and consist of smithy with warehouse over, shop, and residence having hall, two sitting-rooms, and kitchen on ground floor, with four bedrooms, landing, bath-room, and w.c. on first floor. The work has been finished with considerable care, the interior finishings being of a substantial character, at a total cost of 587*l.*, from the designs of Mr. T. BUTLER WILSON, architect, of Leeds and Harrogate.

## SCIENCE AND ART EXPENDITURE.

A RETURN of approximate amounts expended out of votes of Parliament for buildings, furniture, and fittings, and, in some cases, purchase of sites in connection with the existing establishments of science and art, was published on Saturday. It appears that from 1859 to 1888 there had been spent on Burlington House 288,055*l.*, on the British Museum 1,366,259*l.*, on the Natural History Museum 760,771*l.*, on the National Gallery 394,599*l.*, on the National Portrait Gallery 2,236*l.*, on Marlborough House 8,326*l.*, on South Kensington 526,000*l.*, on Bethnal Green Museum 10,455*l.*, on the Geological Museum and College of Chemistry 62,312*l.*, Royal Gardens (Kew) 56,734*l.*, Royal Botanic Gardens and Arboretum 18,113*l.*, Royal Institution 1,200*l.* The return also gives the expenditure on Scotch and Irish scientific and art establishments.

## BOMBAY MUNICIPAL BUILDINGS.

AFTER considerable discussion upon the qualifications of Mr. Chisholm and Mr. F. W. Stevens, says the *Indian Engineer*, the Bombay Municipal Corporation have decided to entrust the design and erection of the proposed new Municipal Offices to Mr. Stevens. The corporation have agreed that the erection of a dome over any portion of the buildings might be left to the discretion of the architect. It was also resolved that the length of the council chamber of the new Municipal Hall be 65 to 70 feet, and that the breadth and height of the same be left to the discretion of the architect.

## THE LAKE DEPOSITS OF SOUTH DEVON.\*

BY S. SMITH HARVEY.

THE Great Western Railway leaving Exeter runs down the west side of the Exe estuary, skirting the sea and the red sandstone rocks of that beautiful coast, and at Teignmouth opens up the estuary of the Teign, and rapidly reaches Newton Abbot. Leaving that town, and following the river for about four miles, the naturalist finds himself in the centre of the Bovey Heathfield, and one of the most interesting geological deposits which we have in Great Britain. On either side the ground slopes up to the moors, crowned with weather-worn granitic rocks, which at some remote period must have been forced through the strata below, to a great height, and since then have again been denuded by the storms which for untold years have beaten around them.

This interesting and beautiful spot was once a miocene lake, and the only example we have of that period in our country. It seems, as has been justly remarked, as if the ordinary conditions were here entirely reversed. Generally we find the high ground covered with gorse and bracken, and the valleys smiling with corn; but here the uplands are rich in corn, and the old lake bed is given up to sedge and gorse. The reason is apparent, for where we now stand was doubtless a million or so years back a beautiful little lake, and the valley of to-day, with its potteries and clay works, was then a scene of tropical luxuriance, followed later on by a glacial period. Referring to this scene, Sir C. Lyell writes:—"On the west and north-west rise the lofty granitic hills of Dartmoor, with their burden of metamorphic rocks; on the north the trappean elevations of Hennock; and on the east and north-east the greensands of the Chudleigh district."

What was once this deep quiet lake of about nine miles in length by about three in breadth, and from 200 to 300 feet in depth, has by the unwearied efforts of nature been gradually, century by century, filled up a grain at a time, until the water has gone, and we have left a lake of valuable clay. Nature, with that wonderful provision of hers for our wants, gives up for our use, in the form of a thousand things of utility, that which a few years since was cursed as a soil that would grow nothing.

Let us see what is the nature of the material which has filled up this old-time lake, and whence it came. We are amazed at the lapse of time which must have occurred from the period when nature began her work until she completed it. Given a light friable soil, it would not be difficult for many a rivulet and stream to fill up a lake ten times as large as this one; but the conditions here were very different, for the whole district around the old lake is formed of granite and consolidated greensand. If we examine one of the many clay pits which abound here, we shall find that the clay is a mass of disintegrated granite and greensand, which has been set free by the action of the weather, mingled with the waters of the lake, and gradually deposited on its bottom until it has filled it up.

This old miocene lake is of special interest to geologists, for all we know of that period, as far as this country is concerned, must be found here. It is, I believe, generally thought that at this part of the Tertiary period Great Britain was joined to the Continent, for it seems certain that the sea did not approach this district, or we should find marine deposits, which we do not.

The general conditions of the district were pretty much what they are now. Then, as now, the granite rocks of Dartmoor must have faced it on the left, and the ridges of Haldon on the right. The rocks and boulders must have been forced up long before the lake existed, as is clearly proved by the fact that the lake is filled by the detritus from them. The great rocks of Dartmoor must have existed from the Permian period, and probably stood out a mountain island in the midst of the triassic and oolitic seas, during the period when the great chalk deposit of Southern England was being laid down. Professor Judd tells us that the contemporary volcano of Mull, in the Hebrides, probably lost three-fourths of its height by the grinding of the Glacial age, and the wear and tear of the recent periods.

Granite, which appears to be so hard, when assailed by the unceasing wear of time, has to give way, and in this case was carried down in thousands of tons to the lake below. There must then have been no Teign estuary, or no lake would have been formed. Probably the gradual rising of the lake bed caused the waters to force a fresh exit, and thus this outlet was formed. With regard to the vegetation which covered this district at the early period of which we are now treating, we are indebted to Mr. Pengelly, F.R.S., of Torquay, for much of what is known, and I am also much indebted to Mr. G. Ross Divett, F.G.S., of Bovey, for much valuable information and many interesting specimens bearing upon this subject.

\* A paper read before the West Kent Natural History Society, at Blackheath.

This lake is famous for its extensive deposits of lignite or wood-coal, and to it we must look for enlightenment as to the flora of that period. Mr. Pengelly remarks that England then enjoyed a sub-tropical climate, which must have generally resembled that of the Lower Himalayan slopes in its character. The lignite has been examined carefully by Professor Heer, of Zurich, who is eminent for his knowledge of fossil botany. His examination has resulted in establishing the fact that evergreen oaks and eucalyptus covered the uplands, many tropical trees and shrubs the valleys, and the low grounds abounded with the most glorious ferns. The mass of the lignite appears to be formed from the remains of a tree much resembling the *Wellingtonia gigantea*, and called in honour of the Baroness Burdett-Coutts, *Sequoia Couttsiae*.

Water-lilies blossomed on the margin of the lake, and even the presence of the fossil seeds of grapes have been determined. As Mr. Grant Allen eloquently remarks:—"This little revelation of the past tells us what was the condition of our country in the day before yesterday of geological history, before that cold spell from whose lasting results the circum-polar world is only now beginning to recover itself." Mr. D. Ramsay, speaking of Professor Heer's remarks on this subject, says:—"A description so vivid needs no comment, and of this we may be sure, that this fragment of a flora only represents a small part of that of a vast continent to which the British Isles were united, and which, embracing Ireland, spread far to the north and west into the area of what is now the Atlantic, and on the south was united to Africa, when, as yet, the Mediterranean had no existence." We learn little or nothing from this spot of the animal life of the Miocene period, and Mr. J. H. Kay, in a paper read before the Geological Society, remarks:—"We can with our present amount of knowledge suppose either that no animals existed around the old lake, or what is more probable, that the conditions of the strata were inimical to the preservation of animal remains," and I venture to think that nothing is more likely than that they would be quickly absorbed by the rampant vegetation around.

Of course we could by inference learn from other similar deposits on the Continent and elsewhere what was the nature of the animal life which thrived in this old world corner, but we have nothing in the South Devon deposit to start from, and we must leave it. It may here be interesting to notice that in 1881 was found in the clay pits of Messrs. Candy & Co., which are close to the Heathfield station of the Great Western Railway, an ancient canoe under about 20 feet of clay. After being carefully dug out it was examined by Mr. Pengelly and others, and it excited a great deal of interest at the time. Unfortunately when dry and exposed to the air, it quickly fell in pieces and became valueless.

Mr. Blake, of Newton Abbot, mentions that about the same time was found in a clay pit near Teignbridge a rude wooden image, in the form of a naked male figure, about 18 inches in height, and of the roughest finish. About three years later some workmen in the same place found a fine bronze spear-head of about 10 inches in length. Two stone moulds for casting bronze weapons were also found embedded in the clay. These, with remnants of potsherds and other minor matters, form the principal objects of interest which have been met with. It is difficult to account for the presence of these objects in the Bovey Lake, and equally so to deduce any lesson from them; they may have been brought from a distance by floods, and have been reburied by the waters. They suggest a Norse or Phœnician origin. The wooden figure may have formed the prow or figure-head of a canoe, or it may have been for purposes of worship. It has been suggested that the canoe was of Glacial age.

Curiously, the only animal remains found in the lignite consist of a few specimens of a fossil insect, detected by Professor Heer, who came over to assist Mr. Pengelly in his researches. It is known as *Buprestes Falconeri*. These investigations were undertaken at the sole cost of Lady Burdett Coutts, and their results were embodied in an elaborate report, which was printed in the transactions of the Royal Society for 1862. Appended to it are many pages of beautiful illustrations of the plants found in the lignite, which are of great interest to fossil botanists.

Turning from the past to the present, it may be desirable for one moment to notice what the wear and tear of past ages in this spot, the ceaseless grinding of the river beds, the disintegrating effects of the weather, and the slow deposit of vegetable matter have given us. First, one of the most valuable deposits of granitic and stoneware clays in the world. As a proof of this, a constant succession of sailing vessels leave the port of Teignmouth for the pottery districts and the Continent, and the export of these white clays forms one of the chief industries of the neighbourhood. At Bovey Tracey are extensive works for the production of earthenware, which is sent through the western counties. There are also large works at Heathfield station, where Messrs. Candy & Co. employ some hundreds of persons in the manufacture of facing, engineering, and paving bricks of a buff colour.

The lignite or wood-coal is of great interest; it was discovered over one hundred years since, and was used as fuel for domestic purposes, and for some manufacturing uses, and even now it is burnt by the poorer inhabitants of the district; but owing to the large amount of ash it therefore produces, it is not a desirable fuel. Apart from this it gives off a disagreeable odour in burning, owing to the mineral oil it contains.

There are large quantities of this coal, and only a use for it has to arise and thousands of tons of it can be raised. Mr. Ross Divett, F.G.S., of Bovey, and Messrs. Candy & Co., of the Great Western Potteries, have caused experiments to be made for its use as a medium for the purification of water and the defecation of sewage with some success, and lately attention has been directed to its use for the decolorisation of sugar.

In conclusion, I will very briefly remark upon the clays as they are found, their value and uses; and here let me direct attention to a test boring which was taken about ten years since, before the works at Heathfield were erected. It will be noticed how small a portion of head, or waste, is found here at the surface, and how much the clays vary in character and quality, improving, as might be expected, as the depth increases. The boring goes down to 130 feet, with no sign of exhaustion. The strata are very irregular towards the surface, probably caused by floods during deposition.

The surface clays of the district are principally used for making a common grey or buff brick, used locally. The white, or potter's clay, is largely used for the manufacture of stoneware pipes and sanitary apparatus, and is valuable for this purpose on account of its ready vitrification. The greyer or fatter clays are used for the manufacture of paving and facing bricks of a more valuable character, which are impervious to moisture and which resist the action of the strongest acids. These bricks are extensively used through the country, and are also largely exported. The quartzose, sandy clays, are made into firebricks, as they contain about 80 per cent. of infusible silica. It is remarkable how almost exactly the Bovey clays have retained the character of the granite from which they are derived, as shown by analysis. From the fact that these granitic clays were deposited in a considerable depth of water, they are, except near the surface, free from stones and débris, and in working have only to be thoroughly mixed, subjected to great pressure, and afterwards burned in Hoffmann kilns at a very high temperature, when thorough vitrification takes place.

The district surrounding the Bovey basin is full of interest, and I cannot do wrong in advising the naturalist to make a note of it as the scene of a summer holiday.

## THE COCKBURN ASSOCIATION.

IN the yearly report, the council of the Cockburn Association state that during the past year no works have been undertaken within the city of Edinburgh calling for special comment. The council then proceed to condemn the proposal submitted to the Town Council to cover over a portion of East Princes' Street Gardens as a recreation hall, and to refer with approval to the alterations at the Castle, and to suggest that the Government might turn its attention to improving other buildings connected with the Castle, particularly the offensive piles of masonry overlooking Princes' Street, and also to removing the gross disfigurements on the south side of the rock. Reference is next made to the completion of the row of buildings at Castle Terrace, to the new Board schools commenced or completed during the year, and to the Public Library. In the latter connection attention is called to the necessity for completing the front of the County Buildings facing George IV. Bridge. The University dome and hall, the Buccleuch statue, and the Students' Union each receive a paragraph—a hope being expressed that the removal of the buildings adjoining the Students' Union may render the site more satisfactory. In the matter of street architecture, it is remarked that the council of the Association have observed with great satisfaction the memorandum issued by the Dean of Guild Court for the guidance of architects and master builders, designed, in the words of Sir James Gowans in the preface, "to facilitate the preparation of plans to be submitted to the Court, and to secure the erection of sound, sanitary, and tasteful houses and buildings." A suggestion is made that certain lime-trees in Queen Street Gardens should be better looked after. The council proceed to express satisfaction at the restoration of the turf to the West Meadows, and hope the ground at the foot of Pitt Street, Falcon Hall, and the Braid Hills may be made available for the use of the citizens. Disapproval is expressed at the proposal to put the expense of the Botanic Gardens on the University. Under the heading "Eyesores," the citizens are reminded of the gaswork chimney, likely soon to become their own property, and the days of which, it is hoped, are numbered. When the arrangements for the prevention of the pollution of the Water of Leith have been carried out, the mill lade, it is

recommended, might be dispensed with. A stair from the Dean Bridge to the walk below is suggested, and further on attention is drawn to the increasing prevalence of enormous advertisement hoardings in the city. The death of Mr. William Nelson is referred to, and the hope expressed that his mantle may have descended on some other citizen of equal taste, liberality, and public spirit.

### ROYAL ARCHÆOLOGICAL INSTITUTE.

THE arrangements for the approaching visit of the Royal Archæological Institute of Great Britain and Ireland to Royal Leamington Spa are completed. The patrons of the meeting include Mr. Jaffray (high sheriff of the county), the Archbishop of Canterbury, the Marquis of Northampton, the Earl of Warwick, the Bishop of Worcester, the Right Hon. A. W. Peel (the Speaker), and many others; while Lord Leigh ranks as president of the meeting. In the list of the vice-presidents are the Mayors of Birmingham, Stratford, Warwick, Coventry, and Leamington; Lord Compton, Mr. J. S. Dugdale, M.P. (recorder of Birmingham), and many of the local clergy and gentry. There will be three sections—the antiquarian, historical, and architectural. The opening meeting will take place on Tuesday, August 7, when there will be an inaugural meeting at the Town Hall, an excursion to Stratford, and in the evening the antiquarian section will be opened. Wednesday will be devoted to excursions to Banbury and the opening of the historical section. On Thursday the annual meeting of the members will take place, and in the evening there will be a *conversazione* in the Town Hall. Friday will be devoted to excursions and sectional meetings; and on Saturday there will be an excursion to Coventry, and a sitting of the sections. On Sunday there will be a special service at the parish church, and on Monday, Tuesday, and Wednesday, the 13th, 14th, and 15th, a succession of excursions to Hatton and neighbourhood, Leicester, Melton Mowbray, and Ratcliffe College.

### ARCHÆOLOGY IN GLOUCESTER.

THE thirteenth annual meeting of the Bristol and Gloucestershire Archæological Society was held at Gloucester on Monday, Tuesday, Wednesday, and Thursday of last week. At the preliminary meeting the annual report was read, which stated that there are at present 389 annual, 77 life, and three honorary members, in all 469 members. The income for the year, including a balance brought over, was, excluding fractions, 535*l.*, the expenditure was 271*l.*, and the balance in hand 263*l.*; but from this latter sum had to be deducted the charge for the annual volume of Transactions. A balance of 80*l.* was still due from the Berkeley MSS fund to the general fund. The society had, moreover, a funded capital of 432*l.* The *Gloucester Chronicle* contains a report of the proceedings, which is marked by the accuracy that is characteristic of the journal when treating of archæology, and from it we take the following:—

Mr. R. V. Vassar-Smith, the president for the year, selected the archives of the Gloucester Corporation for his opening discourse. He remarked that the city possessed a truly grand collection of very early deeds. Its importance may be readily brought out by a contrast with those possessed in other ancient borough records. The Nottingham Corporation possess only 13 deeds older than the year 1300; at Leicester there is one small packet of deeds of this period; at Southampton 14 deeds, and the King's Lynn Corporation possess 12. But at Gloucester we have no less than 571 deeds of this time, and of that number 81 belong to the first quarter of the thirteenth century—some are even earlier—159 to the second quarter, and 232 to the third quarter. Incidentally they throw great light upon local and personal names, and they contain scores of early field names. A large proportion of them relate to Gloucester, and they preserve the early forms of the street names, &c., in the town. From one of them, dated August 5, 1347, we learn that the prior of the hospital of St. Bartholomew, rector of the church of St. Nicholas, granted permission to the parishioners to build upon a piece of land between the wide door and wall of the church on the north and the king's highway on the south, extending in length from the stone wall at the back of the chapel of St. Mary in the same church on the east to the stonework of the belfry of the said church on the west, on condition that all rent or profit arising from the said building should be applied to the repair of the church. The building appears to be what is known as the south aisle of the church, which is a singular feature in the structure. Another deed, dated 1347, is a grant from the prior of St. Bartholomew to the White Friars at Gloucester of an aqueduct from the spring called "Goswhitewell," to be brought by means of a lead pipe under the land of the Hill, now part of Wotton. It is rather interest-

ing to read of lead pipes at so early a date, but this is not the only case in the Gloucester records, for there was at this time a lead pipe bringing water from Robin's Wood Hill to the abbey of St. Peter and to the Greyfriars.

#### *Gloucester Cathedral.*

The first visit was to the cathedral. On assembling in the choir an address was delivered by the Dean, who said their glorious old minster church of Gloucester registered, if he might use the term, a strange and mighty epoch in the civil and religious history of England, as well as of Germany, France, the Netherlands, &c. In the cathedral they passed from the stern and solemn grandeur of the Norman nave, with its massive columns, unadorned roof, and comparatively little windows, through an iron gateway into the perfectly new and strange building in which they were then sitting. It would seem as though they were entering another age. Other thoughts had evidently been at work there. The views, aspirations and wishes of the builders of this part of the great minster had evidently undergone a mighty change since the period when the other parts were constructed. Here there were no massive fortress-like pillars; here the roof soared to a height never attempted in the Norman nave, and with York and Westminster it shared the distinction of being the highest in England. A perfect lacework of tracery in stone covered the storied roof; the comparatively little windows gave place to vast openings, generally filled with rich jewelled glass, one of which positively claimed to be the largest in Europe, and rather larger than that of York. The student would wonderingly ask whether centuries had elapsed between the period that produced the Norman nave and that which gave birth to the builders who changed the great cathedral into these two forms of decorated richness; and he would be surprised to learn that about one and a half centuries elapsed between the two ages. What happened in this period that brought about so great a change? The answer supplied something of the causes which were at work, and which produced, not the nave and choir of Gloucester Cathedral, but Gothic architecture, one of the earliest forms of which was the Gloucester Perpendicular. It was too much the habit of people to say that architecture was derived from one form after another, from simple means apparently in the architect's studio. But nothing was further from the truth than this. The architect was simply a man who worked out the needs of his time. We must go far deeper than the architect's studio to find out the meaning of Gothic architecture. At least that was his theory. At the time of William the Conqueror, his father and sons, roughly speaking the eleventh century, there was a feeling not only in England but also in France, Germany and the Netherlands, of insecurity and of perpetual danger to life and property. No one was secure. Perpetual wars harassed Saxon England, as well as France, the Netherlands and North Germany; they were terrorised by the sea pirates from Denmark and the Northern countries. In all the kingdoms he had mentioned the Sovereign was dominated by an ever-changing succession of professing subjects, but really independent and powerful chieftains, men at constant warfare with their liege lord or with one another. What wonder was it, then, that the churches built in these stormy days in many ways resembled fortresses? The dominant idea in the architect and builder's mind was that the pile they were designing and erecting must be capable of being defended. The same thought prevailed in regard to a palace or a house. Thus when William the Conqueror erected his London house he built the Tower of London, and its White Tower still threw its shadow over the waters of the Thames. So when an abbey was designed the same thought coloured the builder's design. A great abbey or minster like Gloucester was not meant to stand a siege, or to receive a garrison of men-at-arms, but the fortress idea could never be dismissed from the mind of the architect; hence the enormous thick walls, the massive pillars, the small apertures just enough to admit a little light and not enough to admit a missile; hence the ponderous battlemented tower, such as we saw at Tewkesbury, probably designed by the same mind as produced its grander sister at Gloucester. What was applicable to England in this matter was also applicable to other countries. From the day of Hastings onwards a new state of things began. Gradually under the strong rule of the Conqueror the general feeling of insecurity ceased. Before the middle of the twelfth century there was no real fear of a disturbance at home; no dread of invasion abroad. The rule of the Vikings had become a terrible story of the past, while the strong hand of the Angevin King crushed down independent action, and the idea of a stronghold and a fortress became less and less a prominent thought. The architect and the builder had greater scope for the exercise of their skill. From 1150 to 1216 the new minster churches which were planned were on the lines of Serlo's church at Gloucester. A new spirit of architecture, termed Early English and Decorated, had for many years been felt. This showed itself in a marked manner in Edward II.'s reign, when Abbot Thokey substituted in the south aisle for the former plain windows the

splendidly-decorated windows we now saw. But the full development of the new idea was not yet, though it was close at hand. The fortress idea was the great notion which inspired the Norman builders. But there was another feeling at work. There was, we must remember, a great religious revival. It began before Norman William's time, but it was really carried out about that time, in the middle of the eleventh century. It had begun before that, when Dunstan was Archbishop of Canterbury. But the real great religious revival was, we might say, in the second half of the eleventh century. The ordinary thinker had no conception of what the state of the Anglo-Saxon Church was when there was scarcely a clergyman who could read the Latin tongue, in which the service was then performed, and simony prevailed everywhere. The great preferments in the Church were constantly given to very young people, who, in many cases, were utterly unfit for the work. Money was received and taken for benefices, from the small chantry to the abbacy of a great abbey. In addition to which, he grieved to say, the morality of the Church in the days before the great revival was very lax indeed. Then came the great revival, and men of gigantic power were raised up, such as Hildebrand, the great Pope, and our own Dunstan; and in the middle and latter part of the eleventh century we came to the great names of Lanfranc and Anselm, archbishops of Canterbury. There was also a great reform in morals, and the services were changed. These two great thoughts were to him at the bottom of the new architecture. Very shortly after William's death we found the architecture gradually changing. The Early English and Decorated came in with the great religious revival; then the Perpendicular was a development from these other styles. The great Gothic cathedral was the perfect place for the great Mediæval service, which could never have been carried out in its entirety in a Norman building. It needed buildings like this. There were people who told us that the origin and suggestion of the Gothic arch was the arching of trees in the avenues of a forest. That was very ingenious, but utterly false. Nothing of the kind could possibly have been produced. Another favourite theory was that Gothic architecture was derived from Saracenic models. This as a theory was equally false. It was certain that the Crusades exercised an influence upon architecture, and it was not improbable that certain models of arches were derived from the East. But it was absurd to suppose that Gothic architecture sprang from Saracenic models. In a great Gothic building like the cathedral we had all the symbolism of glorious Christian art. We had the building first of all in the shape of a cross, with the nave and two aisles; and we often had, though not in Gloucester, but for instance in Strasburg, a mighty rose window at the west, which typified the Unity. We had in almost all these grand old fanes a great crypt beneath, which was beautifully symbolical of the world beneath where the soul rested in peace waiting for the Judgment morning. We had in these buildings other kinds of symbolism—the high altar at the east end; the windows of the clerestory typifying the mounting of prayer up to the Throne of God—and other symbolism of the imaginative mind. Though we might not positively approve of all that our ancestors did, we were men enough to give them credit as men of prayer and men of action, and when we stood in such a building as Gloucester Cathedral we could say that no such building has ever appeared since the fourteenth century.

An examination of the cathedral was then made, one party being taken over it by the Dean, another by the Rev. W. Bazeley, and a third by Mr. F. W. Waller. The latter gentleman commenced by exhibiting the ground plans of the crypt, the general building, and the triforium, which have been carefully worked out by Messrs. Waller and published. By this means the remains of the old Norman church were shown in relation to the later work built upon it. The Abbey of Gloucester, as most of our readers know, is believed to have been founded by King Osric towards the latter end of the seventh century. Abbesses were its first rulers, and afterwards secular priests, and 200 years later Benedictine monks. In 1058 a new church is said to have been completed by Aldred, Bishop of Worcester, but the position it occupied is unknown. The history of the cathedral as it now stands commences probably with the abbacy of Serlo, who was appointed in 1072, and he is recorded to have completed the edifice in 1100. Nearly the whole of the crypt and the main walls of the building, except the lady chapel and the cloisters, are up to a certain height the walls of the old Norman church, but cased with work of later dates, extending from 1150 to 1550. During the abbacy of Thokey (1306-1379) the body of King Edward II., who was murdered at Berkeley Castle, was brought thence, by direction of the abbot, and buried in the cathedral. The offerings made at Edward's tomb greatly increased the wealth of the abbey, and thus provided the means by which many of the finest portions of the present structure were erected. The Norman pilasters, piers, arches, and triforium, the north aisle of the nave, and the abbot's cloister and chapter-house, were erected during the abbacy of Serlo (1072-1100); the Early

English groining of the nave, and the north transept and reliquary, about 1240; the south aisle of the nave, with the Decorated windows and groining during the abbacy of Thokey (1307-1329), and the ambulatory and chapels, with their Norman walls and groining and the Decorated and Perpendicular windows inserted in Norman openings. The choir and presbytery 1337-1377. The cloisters (the finest in England), of Perpendicular style of architecture, were erected 1351-1412; the north transept (Perpendicular on Norman walls) 1368-1373; the south porch and west end of the nave and aisles, the Perpendicular windows of the nave 1421-1437; the tower (Perpendicular) during the abbacy of Seabroke (1450-1457); the lady chapel (Perpendicular) 1457-1499. The parties who accompanied their respective guides had reason to be well satisfied with the explanations which were given of the various portions of the building, which were thoroughly well examined, the visit of each party being so timed as not to interfere with the other. All the well-known features of the glorious old cathedral were indicated or dwelt upon, and its unique beauties pointed out. An examination was also made of the tentative decoration of part of the reredos with gold and colour. Although many observed the experiment in silence, some of the members did not hesitate to express their approval of the proposed addition, on the ground that the beauty of the workmanship displayed by the sculptor could be more readily appreciated, while others did not hesitate to condemn it as tawdry and unworthy of the solemnity and reverence so fittingly inspired by the noble building.

#### *Masons' Marks in the Cathedral.*

At the evening meeting, Mr. Henry Jeffs read a paper on the Mason's Square monument in the south transept of the cathedral, and masons' marks generally. The paper was illustrated by large and well-prepared diagrams of great numbers of these marks. Mr. Jeffs said that masons' marks were very old, although it was only half a century ago that they assumed archæological interest. Then it was that they came under the observation of Mr. Godwin. The Fraternity of Freemasons, to whom some of those present belonged, and who were recognised for marks of symbolical significance, had no attachment at all with old masons' marks. That Fraternity could go back no further than the year 1717. "All squares, levels, and perpendiculars were true and proper signs by which brethren of the Fraternity of Freemasons know and recognise each other." He could develop nothing beyond that except to his brother Freemasons. Digby Wyatt alleged of old operative Freemasons that they were itinerants, wanderers upon the face of the earth, to see what they could see and to live upon what they could earn in pastures new and green, depending upon the protection of masons' lodges, to which it was said they claimed affinity, styling the associations as "mother lodges," and that they possessed grips and passwords upon which they relied. But what were these "grips and passwords"? Simply speculative! We were told these lodges of the ancients went to decay until their revival in the eleventh and twelfth centuries. In the fifteenth century there was a Trade Union of Freemasons, which brought the civil power down upon them, which defined when the operative masons should work, and how they should work, and what wage they should receive, and their obedience to law and order was insisted upon. Monarchical and ecclesiastical authority were on the side of operative masons so long as the masons were obedient. But the masons sometimes rebelled, and their societies were suppressed. Masons doubtless rebelled against kingly power and the supremacy of the Pope. Abbots, monks, and their subordinates had little if any architectural knowledge, and no geometrical power. Mr. Godwin travelled England, France, and Germany, and found hundreds of masons' marks, but he could make neither head nor tail of them. Mr. Jeffs then went on, by the aid of the diagrams, to point out and discuss the peculiarities of these old marks. Such marks were found on the Egyptian Pyramids, on the excavated walls of Jerusalem, throughout Europe, in Mexico, Peru, Asia Minor, and the lecturer expressed his belief that if these marks were to have explanation, Oriental scholars, learned linguists, and philologists of careful study, must give long lives to the task. He showed that monumental inscriptions in Carthage, of which he had procured copies, and marks in the Egyptian almanacks, resembled some of the masons' marks in Gloucester. Referring to the Masons' Guilds, he said that Gloucestershire was asserted to have had a School of Masons of its own, and the cathedral of Gloucester was localised as an Architectural College. It was claimed that a College of Freemasons traced back to the days of Claudius Cæsar, and that a temple was dedicated to Neptune and Minerva, a tablet of notification of this being preserved at Goodwood, having been unearthed at Chichester. Coming then to the Mason's Square in the cathedral, Mr. Jeffs stated that nearly twenty years ago he wrote an article in reference to it, and the publication of this article in the *Gloucestershire Chronicle* led to a correspondence between him and the late Mr. J. D. T. Niblett; and he also published an article in a

London magazine, with a woodcut illustration of the monument, which he now showed. Some years prior to this he had read:—"The two figures of the mason and his son or apprentice, who were employed upon the improvements made at this time, is a curious reminiscence of two very skilful operators. In many of the foreign cathedrals are sepulchral and other memorials of the heads of the lodges of Freemasons, some represented with the rule, the compass, and square, practising the art of setting out the respective works." The monument was attributed to John Gower, who was alleged to have killed the young man shown also on the monument for neglecting his duty. But this tale was told of other chapels and cathedrals. Rosslyn Castle had an old man's head and a young man's head. The latter had a streak of ochre or blood to show that the old man had killed him. He heard a similar tale a quarter of a century ago at Lincoln Cathedral. He believed the Norman builders borrowed these marks from the Romans; and who could reveal the meaning of the masons' marks in Gloucester Cathedral? He ventured to suggest that they were nothing more nor less than the workmen's own private marks, just as was and is the case in some porcelain works, where in the manufacture of china each individual puts his own private mark on the piece of porcelain he completes; and in his opinion the marks represented nothing more than some fancy idea of the workmen themselves, and were often varied by them without any meaning being attached to the variation. The marks we saw on the stones in our old abbeys and cathedrals were no doubt similar workmen's marks to those found on china, and their origin cannot be traced, as it was a custom old as the world, and must have been in operation since the earliest days of stone buildings, as marked stones are found in Egypt and Carthage and all other parts of the civilised world. Trade marks were nothing more nor less than the outcome of these private marks, and were only used to distinguish one man's products from those of another. No doubt many marks found on old stones in our churches were cut by the workmen as a pastime, just as a man might now cut his initials on an oak bench for amusement.

The Rev. W. Bazeley said he had given some little attention to the marks in the cathedral, and though he did not believe they meant much, he thought a great deal might be learned from them as to the dates of the several parts of the building. The marks in the nave were so very different from those in the crypt that it did not appear that the same masons could have made them; and if this could be definitely settled, it would also help to settle the disputed question whether the crypt was the work of Serlo. He thought there were two kinds of marks—those of the workmen who cut the stone in the quarry, and those of the master mason or master of the guild; but as to whether the marks had any symbolic meaning, or whether they were connected with the marks on the Pyramids, he was not prepared to say.

#### *Recent Discoveries in Gloucester Cathedral.*

Mr. F. W. Waller read a paper on this subject. Mentioning how difficult it was to find any feature of novelty in connection with the cathedral, he said he would briefly refer to certain discoveries which had resulted from the repair of the fabric since the Society's last visit to Gloucester. He called attention, first, to the stone having on it the much mutilated figure of an abbot, which was found in the north transept, and is now placed in one of the chapels of the crypt. The stone was 6 feet 10 inches long, 2 feet 6 inches wide, and 6 inches in thickness. The figure was covered with a trefoiled canopy, and the whole was in low relief and in parts incised. The stone was evidently thirteenth-century work, and was formerly decorated with colour, remains of which still exist. The next relics which he described were four hard grey stones, very superficially carved, which were discovered when two of the buttresses of the inner wall of the north walk of the cloisters were being rebuilt. These stones he thought had been used as a parapet or guard to a water-tank of some kind, and the work he thought was of the thirteenth century, and might possibly belong to Helias the sacrist, who was stated to have constructed a conduit of fresh water. These stones might now be seen against the cloister wall. Other specimens of Early English work were found at the same time, and were now placed with the abbot's monument in the chapel in the crypt. Of Early English work much at one time existed in the cathedral, and beautiful specimens must have been destroyed and buried by the monks in the fourteenth century. The lecturer then, by aid of diagrams, described the reservoir for fresh water which was discovered in the cloister garth last year, when it was being laid out as a garden for the Dean. This reservoir was supplied from the Fullbrook. It was many years older than the present cloisters, and he suggested whether this also was not part of the work done by Helias, the sacrist, prior to 1237. The rough stone ribs, of which four remained, and which might easily be Norman work, were evidently meant to carry flat stones placed from rib to rib, and the whole, with the exception of the sluice at the west end, was formerly covered up. The overflow passed underneath the west walk

of the cloister, and the groove for the sluice gate at the western end could be distinctly seen. Mr. Waller pointed out that the remains of the water duct looked suspiciously like an old stone coffin. The disregard shown by Mediæval men for the works of their predecessors was well known, and was evident in numberless instances in Gloucester Cathedral and churches where stone coffin lids and coffins were used for door sills, seats, and paving, and numerous other purposes, and beautiful work, such as the Early English remains previously referred to, were ruthlessly knocked to pieces and buried. Mr. Waller, in conclusion, alluded to statements lately made as to the bad condition of the cathedral, and the necessity for further repairs. To many people these statements must appear somewhat extraordinary, looking to the large sums of money laid out in the last thirty years. But the matter admitted of easy explanation when they considered how much had been expended on the choir and its fittings, on windows for the reception of painted glass, and interior work generally; and though the external restorations had been large and important, consisting of the entire repair of the north and south transepts, the south porch, the pinnacles and parapets of the great tower, and minor matters, yet more remained to be done, consisting chiefly of the repair of defective roofs and parapets, and the general repair and pointing of stonework, all most important works of their kind, and essential for the preservation of the building. Under all the financial difficulties with which the Dean and Chapter had had to contend for several years past, the greatest care had been taken by them to keep the building wind and water-proof, and as far as the interior was concerned no dilapidation takes place. Pointing and general repairs were also carried out, as far as limited funds would allow, on the exterior; but there was no doubt that some of the roofs got into worse state every year, and the parapets on some portions of the building were absolutely ruinous.

On the second day an elaborate paper on "Roman Gloucester" was read by Mr. John Bellows. Afterwards he led a party along the line of the Roman wall, and in the afternoon Mr. Bellows conducted a second party along the same route. The Rev. W. Bazeley read a paper on "Mediæval Gloucester." Many of the old houses and other buildings were visited. Mr. Waller described the ancient houses and the old churches. The Black Friars and its history was related and pointed out by Mr. Medland. The Rev. E. G. Penny, vicar, read a paper on "St. Mary de Lode Church," and explained the building.

The Rev. S. E. Bartleet read a paper on "Gloucester Leper Houses," and the Rev. W. H. Sylvester Davies one on the "Grey Friars or Franciscans." There were also papers on "St. Oswald's Priory," by Mr. Henry Medland; on "Roman Houses," by Prebendary Scarth; and on "Gloucester Tokens," by Mr. J. P. Wilton.

#### ARCHÆOLOGY IN YORKSHIRE.

THE Associated Antiquaries of Yorkshire had their twenty-second annual excursion on Wednesday to Richmond and Easby Abbey. The enjoyment of the outing, says the *Leeds Mercury*, was most exasperatingly marred by rain. A special train from Leeds collected contingents at various points, and the passengers hoped against hope almost that the weather in the dales would be more propitious than that in the places sacred to tall chimneys and the smoke of commerce. But the fleet locomotive brought no introduction to brighter scenes, and when the party were deposited on the platform at Richmond Station, even the most devoted archæologist seemed anxious for the comforts of household fires, both warm and bright. But the enthusiastic members—and they included a large sprinkling of ladies—who had braved the wretched outlook of the early morning, had come armed with extensive protection against rain and were not to be denied. A change of programme brought an alteration, which, as events proved, gave more than a semblance of relief. The excursionists turned townwards, leaving the walk along the damp river-side to Easby Abbey to be achieved under more favourable auspices. In the chancel of the parish church of St. Mary were seen portions of stall-work removed from Easby Abbey at the suppression of the monastery in 1535—a real and not a fictitious instance of such removal. Next was visited the Trinity Chapel, standing in the market place, and showing evidence of a chequered career. It has been so far restored to the Church that divine service is conducted in the "upper room," but the appearance of the fabric is blurred by shops formed in the bays of the lower storey. Last year's excursion to Conisborough and Roche Abbey enabled the members to inspect the circular keep of the castle mentioned in Scott's "Ivanhoe," while now they were able to contrast this with the massive rectangular keep of Richmond, alike commanding from its great size and its bold situation. The keep at Richmond was a favourite subject with Turner, who sketched it from the Easby side, with the torrent-flooded Swale in the foreground, and also from the upper part of the

valley, where it forms a striking feature in the middle distance. Justice has been done to this fine structure by Mr. G. T. Clark—no mean authority on military architecture—who has contributed a paper on the subject to the "Journal of the Yorkshire Archaeological Association." The inspection of the castle was conducted under the cheering influence of some abatement of the storm; and by two o'clock, the hour fixed for luncheon, the rain had entirely ceased. Under the circumstances the members were not wanting in appreciation of an excellent repast; and as by the time that the meal and the speech-making had been concluded the sun had struggled timorously forth, the walk to Easby was entered upon with some measure of agreeable anticipation. The Abbey of St. Agatha, at Easby, was founded in 1152 by Roaldus, Constable of Richmond Castle, and endowed by him with sundry lands; it was further enriched by gifts from the Mowbrays, Alan Bygod, and the Scropes. It was inhabited by Canons of the Premonstratensian Order, who lived according to the rule of St. Augustine, as reformed by St. Norbert, afterwards Archbishop of Magdeburg, who set up this regulation at Premontre (Præmonstratum), in the diocese of Laon, in Picardy. Lord Scrope of Bolton was a Baron of the Exchequer in the reign of Edward II., and Chief Justice in the following reign, and at his death was buried here. At the Dissolution Robert Bampton was Abbot, and there were seventeen Canons under his rule. The site of the Abbey was granted to Ralph Gower, and afterwards to John Stanhope. The ruins were described in considerable detail by Mr. St. John Hope, who in September 1886 conducted excavations under the auspices of the Association. The investigations resulted in the plan of the church for the first time being properly made out, and the discovery of a hitherto unknown chapel or sacristy south of the choir. Perhaps the most important matter, says Mr. Hope, in his contribution to the Journal, was the unravelling of the complete plan of the infirmary, which disclosed one of the completest establishments of the kind—despite its comparatively small size—yet scientifically examined. The ancient gatehouse of the abbey, and the granary in the upper storey, were glanced at; while nearly all the members visited the interesting parish church of Easby, which has some resemblance to that of Heysham, near Morecambe. Mr. J. T. Micklethwaite said that a church existed at Eastby before the Canons of the Premonstratensian Order came there. The nave was semi-Norman. The chancel arch is modern, and was done by Sir Gilbert Scott, who chose the ornate style of some Benedictine Abbey, and not that of a modest parish church. The chancel walls contain Scriptural paintings of the twelfth century, restored about twenty-five years ago, but now much obliterated; and there is a wood screen in early fourteenth-century work. Rain fell again on the way back from Easby to the station, and in the meantime the Swale had become swollen and floods were threatened. The train reached Leeds at 8.45 P.M.

There was a large muster at luncheon at the King's Head Hotel, Richmond, about 105 gathering round the table. The Hon. J. C. Dundas presided.

The Chairman proposed the loyal toasts, and followed with that of "Success to the Association." The whole town of Richmond, he was sure, would regret that the success of the excursion had been marred by the weather. Richmond was really a pretty and an interesting place, and he hoped that the Association would be able again to visit the town under more favourable circumstances. The Society had the elements of success in a good balance at the bank, in the support of a large number of enthusiastic members, and in its very interesting publications. Part of the Association's valuable work was the publication of county and other historical records. The North Riding magistrates had formed themselves into an association for the publication of anything of interest in the county records. He understood also that Mr. Thomas Brooke, the chairman of the Council, had undertaken at much expense to publish the chartulary at Selby Abbey, and this was a noble example which might well be followed. He associated with the toast the name of Mr. Brooke. The Mayor of Richmond (Mr. A. T. Rogers) also supported the toast, which was duly honoured.

Mr. T. Brooke, F.S.A., returned thanks. The Association had long thought of visiting Richmond, but had not before been able to do so. Although they had not been favoured by good weather, many would go away with pleasant recollections of the place. Richmond formed a remarkable centre from which the archaeological and antiquarian remains of the North Riding might be specially studied. The Yorkshire Society had now been established for many years. The contributions of life members were invested, and formed a fund which gave to the Society a basis of prosperity and firmness. Of the Record series, four volumes had now been issued. Thus they had laid the foundation for some future history of the county, which he trusted would be built up in a way which had not previously been attempted. They had taken the first step towards the publication, through Dr. Collins, of an invaluable volume of wills treasured at York; and through the kindness of Sir James Hannen they would have opportunities of going still further in

that work. About 300*l.* was required to get this valuable work fairly well forward, and they had up to now promised of something like 200*l.* For the Record Society there was no lack of matter to enable it to carry on operations for many a year. Through the kindness of Mr. G. T. Clark several valuable works on military architecture were now accessible to the members. The researches at Easby had thrown light on what were previously points difficult of explanation. The fund for the excavation work, raised by special contribution, was getting rather low. They had 30*l.* in hand, and if they could double it they could do all they wanted, at any rate for a short time to come. Besides thanking Mr. Jaques for allowing the excavations at Easby, they also owed thanks to Lord Ripon for enabling similar work to be done last year at Fountains. He trusted Mr. Hope would soon be able to elucidate at Fountains one or two difficulties which had always attended the marvellous remains at that place. It had been suggested that an autumn excursion on a smaller scale to the annual one might be held at Fountains, so that the work could be seen in progress; but that might be a matter for future consideration. There was also a great deal to be done at Mount Grace. He did not know any place in the county where more valuable results might be obtained in the further excavation of what was the most perfect Carthusian remain in England.

After a number of new members had been elected, Mr. A. D. H. Leadman read a short paper relative to the discovery in May of a funereal urn at Minskip, Boroughbridge, on what was thought to be the site of an ancient burial-place about two miles south of Aldborough—Roman Isurium.

### AN IRISH LIGHT AND AIR CASE.

**A**N action was lately taken by a Mr. Flynn, who owns the house No. 19 Parliament Street, Dublin, against Mr. Dollard, a paper merchant and printer, who lately erected adjoining premises, on the ground that the new buildings interfered with the light and air of plaintiff's house. A mandatory injunction for a removal of a part of the premises was sought, as well as damages for the injury already sustained. The defendant had acquired a large block of buildings on Wellington Quay, having also a frontage to Essex Street, which was once occupied by Messrs. Scott, Bell & Co., drapers. He denied that the new building in any way interfered with the plaintiff's light at all, and pleaded that although the height of the Wellington Quay premises had been increased, the slanting form of the roof prevented any obstruction to the vertical light to the plaintiff's premises, and that by the removal of the connecting gallery that existed in the old premises, and the substitution of a glazed white brick wall, the light to the back of the plaintiff's premises had been actually increased. It was also pleaded that no change had been made in the Essex Street building such as affected the plaintiff, because the light to his house could only be interfered with by an increase in the height of an adjoining building belonging to the Board of Works, the rear wall of which faced a narrow space between plaintiff's and defendant's premises.

After hearing the arguments the Master of the Rolls said he was not going to pronounce any opinion whatever in the case without further deliberation, as it was one of very considerable difficulty and nicety. There was alleged interference, not with an abundant supply of light, but with a supply which was already very small, and where the question was merely one of degree. There was also a great conflict between the witnesses who had been examined on both sides, and of course he would have to go very carefully through it. Models had been very much relied on, but these only assisted the other evidence. Counsel for plaintiff in his opening statement had asked him to do what was sometimes done, namely, to look at the premises himself. At that time he declined to do so, being influenced by certain authorities, in one of which such a course was objected to on the grounds that such a proceeding might be impracticable where the premises were at a distance: that the judge might be colour-blind, and that if the judge availed himself of his own observations, a court of appeal might not afterwards be able to distinguish to what extent he acted on his own observation, and the evidence of the witnesses respectively. But when it was possible for him to see the premises it was not illegal to do so, and if the case should afterwards go to the Appeal Court its judges could either view the premises themselves, or decide on the evidence of the witnesses only. The reason why he had changed his mind on the matter, however, was that at first he thought the witnesses would have been subject to cross-examination. The parties had not done that. Therefore, he would visit the premises, and would ask the solicitors on each side to meet him at a convenient hour on the following day.

After an examination of the premises and a week's consideration, the Master of the Rolls delivered judgment. He said that he did not blame the plaintiff for having taken an

intelligent interest in the law on the subject, or manifesting a desire to get pecuniary compensation for any interference with his rights that was shown to have taken place. The witnesses examined on behalf of the plaintiff included persons who had been acquainted with his premises both before and after the erection of the new buildings. Mr. Neale, a former tenant, stated that gas had, since the erection of the new buildings, been constantly kept burning during the day. No account, however, showing an increase in the quantity of gas burned, had been put in evidence. He had been asked by both parties to visit the premises. He had done so, and he should do so in such cases until he was authoritatively told that such a course on his part was wrong. He bore in mind the fact, however, that what he saw was only the premises as they now were. To say that the plaintiff's premises had been, since the erection of the buildings complained of, almost constantly lighted by gas by day, appeared an extraordinary statement, and he hardly thought it could be true of summer time. He saw the premises on a July day at ten o'clock in the morning, the day not particularly brilliant, but the light being improved by the white-washed wall; and he never was in a better lighted shop in his life. The witnesses for the plaintiff had not been cross-examined, though of their truthfulness he had no suspicion. But their evidence was open to the observation that in making their comparison most of them started with a date at least ten years ago, and they compared a state of things which they saw when tailoring business was carried on, and the place unobscured by stock, with a state of things which they saw at the time of the occupation of Mr. Neale, the ironmonger, who immediately used a considerable portion of the place for the storage of stock, which, in the opinion of other witnesses, obscured the place. Their evidence was also open to the observation that not one of them applied any actual test for the purpose of ascertaining the quantity of light, such as the reading of small print. The witnesses for the defendant had largely directed their evidence to the state of things at the present time. Defendant relied on a class of witnesses of whom the plaintiff had availed himself but charily, namely, architects. The evidence of an architect on a question of light and air was—in His Honour's opinion—of neither more nor less value than that of any other intelligent and observant person. He did not adopt the view that there was any charm in keeping within the angle of 45 degrees—in fact, such was not the law at all, although the fact of adherence to such an angle was not to be discussed as a practical average test. He attached decided importance, however, to the evidence of Dr. Algernon Smith, a professional gentleman, who deposed that on May 7, in the back part of the plaintiff's shop, he opened an abscess in the eye of the plaintiff's child, and that he had plenty of light to do so. His Honour regarded that as a practical test of a severe, *bonâ fide*, and distinct character as combating the case of the plaintiff, that not only was the light inferior now to what it was before, but so hopelessly bad as to render the premises unfit for business purposes. The plaintiff had not given any rebutting evidence, although these were matters to which such evidence might have been applied. The plaintiff, in his opinion, had failed to discharge the onus which lay upon him of showing that there had been an interference of such a substantial character with the light of his premises as to entitle him to the relief he sought. If he had been of opinion even that there should be a decree in favour of the plaintiff, it would not have been for a mandatory injunction, because the premises were not in the occupation of the plaintiff himself, and also because the action had not been instituted until long after the defendant's plans were perfectly well known to the plaintiff, and there had been no application—at least that he had heard of—for an interlocutory injunction. Neither was there any case made for damages, and, therefore, he would dismiss the action with costs.

Messrs. Piers White, Q.C., Bewley, Q.C., and G. Price (instructed by Mr. James Goff) appeared for the plaintiff.

Messrs. Walker, Q.C., The MacDermot, Q.C., and Charles Teeling (instructed by Mr. Ambrose Plunkett) for the defendant.

#### A Royal College of Architecture.

SIR,—There was one paragraph in Mr. Thomasson's letter of last week that I was particularly pleased to see, and that was where he stated that he would make an attempt to form a society for the purpose of architectural education in Worcester. I shall be very glad if he will kindly place himself in communication with the secretary of the affiliated societies' sub-committee of the Association as soon as he conveniently can, so that the requisite steps may be taken for the formation of a Worcester Architectural Association.

A word or two of explanation concerning the letter of

December 31 last, which Mr. Thomasson comments on so unfavourably. He states that the letter referred to was "issued by the Architectural Association." This was not the case. The letter in question was not an official one at all, but simply an unofficial inquiry for the purpose of discovering what was the state of public opinion in the provinces with regard to the difficult problem of provincial education. It is important that this matter should be placed beyond a doubt, and therefore I beg to append a copy of the letter.

[COPY.]

Dear Sir,—A discussion of some importance is now proceeding at Conduit Street upon the question of extending the facilities for architectural education provided by the Architectural Association to provincial students. Resolutions will shortly be presented to the Association embodying the principles of affiliation, which will enable several of the more important provincial Associations to join our body. But there is a class of students in the provinces who are not grouped together in sufficient numbers to join societies, and these are the men we want to reach. Might I ask you, therefore, to be kind enough to furnish me with a few notes upon the position of education in the town of \_\_\_\_\_ and surrounding district, and say what modification of our system would be best for it. I should also take it as a favour if you could get hold of the names of the genuine architectural students in and about \_\_\_\_\_, and let me have them. Personally, I think that great use might be made of our monthly journal, "Architectural Association Notes," of which you have doubtless heard. In case, however, you have not seen a copy, or do not subscribe, I have sent you this month's, which I hope you will accept. Asking the favour of an early reply, I am, dear Sir, your obedient servant,

(Signed) OWEN FLEMING.

157 Wool Exchange, Coleman Street, London, E.C. :  
December 31, 1887.

It was the response to this letter which convinced me that schemes after the nature of Mr. Thomasson's are impracticable, or nearly so. I am anxious that the main question in dispute should not be obscured by side issues. I am quite in accord with your correspondent as to the desirability of some such scheme, and I admire the public spirit that has led to its conception and publication. The question upon which I am not convinced is that of its practicability. Let us look for a moment at this matter from a plain common-sense point of view. To take up such a scheme as this, and to prosecute it satisfactorily, means the expenditure of a vast amount of time, of energy and of money. The correspondence that would ensue would be enormous; this branch would have to be stimulated, that to be restrained, and then, sir, the pecuniary difficulties absolutely frighten one. From the very first start expenditure would be continually going on, and we all know that money is much easier to lay out than to get back again. In short, to carry out Mr. Thomasson's scheme with any chance of success would involve the appointment of a paid organiser of no mean abilities, who would have to devote his whole time to the work, and have at his back a fund of no small size upon which he could draw for his expenses.

Now, sir, I ask where are we to look for the funds necessary to pay the salary of such an official and to cover the various expenses? The R.I.B.A. does not possess the power, even if it possessed the will, to provide these funds, and there is no other body which could fairly be asked to do so. The fact is that the money would have to come out of the pockets of those country students who belonged to the organisation, and I venture to assert that it would be almost impossible to get the students to pay sufficient to cover all the costs that would be incurred. This, then, sir, is my difficulty, and I am afraid I must remain sceptical as to the practicability of the undertaking until I can satisfy myself that its financial prospects are reasonably good.

To sum up. I am not disposed to admit that there exists a widespread desire on the part of provincial students for the advantages Mr. Thomasson purposes to confer. And secondly, the financial difficulties are so great as to absolutely preclude the formation of any such system of University extension, at all events for a long time to come. I do not propose to enter into a lengthened defence of the Architectural Association in its rôle as a collegiate body, as I can neither recognise in Mr. Thomasson's letter a really strong argument against the position I took up in my previous letter, nor do I deem myself competent to act as the champion of so important a body. I cannot, however, refrain from briefly alluding to the letter in the A.A. Notes, which—according to Mr. Thomasson—sadly exposes the inadequacy of the Association to provide even for London men. Why, sir, this is simply a letter complaining that there were so many students present at a certain meeting of a certain class, that the writer (presumably another student) could not see a bit what was going on. Yet this letter is what Mr. Thomasson relies on to prove without a doubt the total inadequacy of the A.A. evening classes to provide for the advanced professional education of British architects! Mr. Thomasson will, I am sure, forgive me if I say that the little education I have had in logic is quite insufficient to enable me to comprehend his remarkable deduction.—Yours, &c.,

OWEN FLEMING.

**The Revival of Architecture.**

SIR,—I wish to disagree entirely with the method of Mr. anonymous "Criticus," in singling out any one of our professors as in any way especially culpable, either in his words or designs, in regard to modern style or styles. But in all else I entirely accord with the ideas he expressed last week. Truly, I am overjoyed to find another who is able to publicly declare in favour of the views I have often defended in these columns. Before proceeding, perhaps, I may be excused remarking that I should greatly like to know whether "T.V.S.," of some few weeks ago, has become converted to my theories, and has now commenced to argue on my lines under another totally uncalled for pseudonym—"Criticus"? It may be. However, I do not like the first statement "Criticus" makes. How can a man who is inwardly a pessimist make broad and liberal public utterances? He cannot do it. Should he possess that craft and cunning, he will be false. And of what use is that? In mind as with money—

To thine own self be true!  
And it will follow, as the night the day,  
Thou canst not then be false to any man.

"Criticus," I, and divers others are rightly agreed that the Renaissance was but a clever jumble of late Gothic triviality, with Roman ostentation, and that the impetus of the moment often created vigorous deductions from the best elements of those two divergent styles of a then past age. It was a sort of concentration from which we should take valuable lessons, not copies. Its vigour and essence arose from the advanced state of an enlightened system of apprenticeship, which had been gradually developing itself. The time had come for a revolution. And, behold! the revolution bore exceedingly good fruit, which increased and multiplied and gradually degenerated. Who knows whether the times are not ripening for another revolution, and that it shall come to pass?

The Renaissance served for the sixteenth and seventeenth centuries, for the times of craftsmen and craft-secrets, when a master knew his trade in his own original way.

Another style we need for the nineteenth century, now that our teachers are only "Professors of the History of Architecture," and absolutely do not understand the principles of progressive architecture, or, if they do, yet hide their lights under a bushel and present us with the ludicrous spectacle of broad and liberal thinkers uttering pessimistic nonsense, which is absurd. Aye, and above all, now that lucid accounts of the pettiest details of the styles of the past, together with wise and able criticisms thereon, are to be found in our printed books, truly, now we ought to command a creditable style of our own. And why not, pray? Simply because our books contain all we want or can know of the past, and also the ablest criticisms thereon, but our present professors do nothing more than reiterate the teaching of the books. We do not want them to; it is superfluous. Suppose Huxley, Spencer and Max Müller explained nowadays the philosophy of Hume or of Locke, and that only; or that Sir Frederick and his Forty all painted like Reynolds. This is what our professors are doing to-day. I feel the consciousness of undeniable truth in asserting that we have no professor of "architecture" in the sense that Pasteur is a professor of chemistry, or as Edison and Tyndall are professors of electricity. Our present (the past is gone for ever) professors should devote themselves more to investigation and experiment. We are not school children to want lecturers. We can read as well as they.

I submit that one of the chief reasons why architecture is "down in the dumps" is because those who should devote themselves to study personally, take their knowledge second-hand—undergraduate like; and those who ought to search among the inexhaustible treasures of inductive science when brought to bear upon accumulated facts, spend—waste their time in concocting "natty" lectures cribbed from Gwilt, Fergusson and Chambers, pounded together.

In a word, place the big, the good, the really useful, the expensive books within the reach of all students (as I have suggested in my letters on "A College of Architecture"). Then make your professors discover discoveries. What I mean is, follow in the footsteps of the late Professor Gottfried Semper,\* and Mr. Lawrence Harvey will tell you how. Through ignorance or jealousy, I know not which, British architects in general do not seem to welcome the great German thinker, who knew how to apply the "History of Philosophy" to architecture; this is most likely through ignorance. But why such apathy (apparently) should greet his obliging and worthy pupil (Mr. Harvey) when he has so often volunteered to show us the real value of Semper's theory, is, I fear, due to somewhat of—well, at least, impatience. Our professors would teach architecture as a trade, or, at most, as an elevated craft. Mr. Lawrence Harvey would teach us that architecture is

an art, the principles of which are to be learnt only through "The Philosophy" of its history, and not by its history only.

Remaining more deeply impressed than ever with the belief that, before we can advance our architecture, we must be helped to the knowledge contained in printed books, and that our professors must devote themselves to research and experiment, I am, yours very truly,  
FRÉDÉRIC E. THOMASSON.  
Worcester: July 24, 1888.

**Antiquities of the Isle of Wight.**

SIR,—May I address myself to the readers of your paper? I am getting together the architectural antiquities of the Isle of Wight, and should be glad of any assistance in the way of drawings or notes, which would be duly acknowledged and carefully returned. It so often happens that notes, &c., arrive after publication, and, though of value, cannot be inserted without great extra cost. All I desire is to make the work as complete as possible, as no book exists on this special subject. Trusting your readers will understand the spirit of my letter, I am, yours, &c.,  
PERCY G. STONE.  
16 Great Marlborough Street, W.: July 25, 1888.

**CHURCH BUILDING AND RESTORATION.**

**Hugglescote.**—The chancel added to the parish church of Hugglescote was opened on Thursday in last week by the Bishop of Peterborough. The church is well and centrally situated at the head of the village, and forms a prominent feature of the landscape. The style is Geometrical Decorated, of rather a severe type, suited to the character of the Forest stone of which it is built, this being the greenstone from the quarries at Bardon Hill, with Douling stone for the windows, doorways, weatherings, &c. The internal lining is of pressed red bricks from Whitwick Colliery, relieved with terra-cotta and Corsham Down stone and occasional detached shafts of red Mansfield stone. The tower is a massive structure in three stages, having a total height to the weather vane of about 100 feet. The situation being exposed, and the tower a prominent object for many miles, the moderate funds available were used in imparting dignity and solidity rather than in ornamentation. Internally the large tower arches add much to the effect. The contractors were Messrs. T. & H. Herbert, of Leicester. Messrs. Smith & Co., of Coalville, executed the tile floor and terra-cotta. The whole of the church has been erected from the designs and under the superintendence of Mr. J. B. Everard, F.R.I.B.A., of Leicester. The total cost of the sacred edifice amounts to 9,000*l.*, including upwards of 3,500*l.* recently expended on the chancel.

**Harrogate.**—The foundation-stone of the New Town Mission Hall, Harrogate, was laid on the 19th inst. The buildings consist of a hall, 48 feet by 32 feet, and 45 feet across transepts, having porch and vestibule, with octagonal tower rising 40 feet, in which is placed stairs to gallery. On lower ground floor are two vestries; the walls are of yellow sandstone to plinth level, with blue wall stones and white dressings above, and red Broseley tiled roofs open to collar, rising to 25 feet, having Boyle's concealed roof ventilators and inlet fresh air flues in buttresses. Accommodation is provided for 350 persons, at a cost of 1,000*l.* Mr. J. Dickenson is the builder, and Mr. T. Butler Wilson, Leeds and Harrogate, the architect.

**GENERAL.**

**The Prince of Wales** has contributed fifty guineas towards the cost of a new Roman Catholic church in Leeds.

**Lord Ripon** has promised to be present at the opening of the Leeds Art Gallery in October next.

**The Northampton Opera House** was sold by auction on Wednesday, for 9,000*l.*, to Mr. Phipps Dorman, a brewer.

**Mr. L. T. Evans**, of the Water Engineer's Department, Liverpool, has been appointed water engineer for Nottingham. There were 130 candidates.

**Mr. A. Carnegie** has given 100*l.* towards the new town hall, Linlithgow.

**Mr. J. S. Crowther**, of Manchester, has prepared plans for the restoration of the ancient parish church of St. Wilfrid, Moberley, between Alderley Edge and Knutsford, and also for rebuilding the tower and restoration of St. Mary's, Lymm.

**The Town Council of Bath** decided on Tuesday that the principal streets of the city are to be lighted by the aid of electricity.

**The Institution of Mechanical Engineers** will hold a meeting in Dublin on Tuesday next and the following days, under the presidency of Mr. E. H. Carbutt. Lord Rosse is president of the reception committee.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment.

## BEST GREEN ROOFING SLATES.

Unrivalled for Quality, Colour, and Durability.

Highest Award, Gold Medal from the International Exhibition, London, 1862.

The Buttermere Co.'s Green Slates were selected by eminent Architects for the "MODEL DWELLING" in the Newcastle Exhibition Grounds, 1887.

For Prices and Particulars apply to SECRETARY,

BUTTERMERE GREEN SLATE COMPANY, LIM., KESWICK.

THE WEAVER," "THE IMPERIAL," & "THE OXFORD," Patent Sanitary and Ventilating Appliances.

NOTE.—All Closets are fitted with the "Weaver" Flush Fan, with Waterfall Action. (The "Weaver Flush Fan" being adaptable to ALL KINDS of Closets, Licenses may be granted to Manufacturers.) The Flush Tanks are noiseless. There is greater flushing and cleansing power than in any other closet. Trappage up to 3in. With a supply of the Iodate Sanitary Salt to the Tanks, these Closets are odourless. Lead Closet Traps or boarded floors, 7s. 6d. and 10s. 6d. Ball Valves to Flush Tanks for quick filling under low pressures. 3in., 2s. 6d.; 2in., 3s. 6d., and Stop-cock, 3s. 6d.

N.B.—The Interceptors and all other Traps are absolutely self-cleansing, and dispense with grease collectors' Illustrated List, also "Instruction in Sanitary Construction" (Domestic Section, abbreviated), and "Memorandum on House Sanitation and the Law of Landlord and Tenant" thereon, by R. Weaver, C.E., F.C.S., Sanitary Surveyor, free by post.

The Domestic Engineering and Sanitary Appliances Company, 24 High Holborn, London, W.C.

## TRADE NOTES.

ON Sunday morning, July 22, a very large chiming clock was started in St. Peter's Church, Hindley, near Wigan, by the Rev. Peter Jones, the first vicar of the church, who came purposely for the ceremony. The clock has four dials, each 6 feet across, of very chaste but simple design. The quarters are chimed upon four bells, and the hours struck upon the largest bell in the tower. The movement is constructed with every modern improvement, so as to maintain perfect accuracy, and chiefly to the designs of Lord Grimthorpe. It has a gravity escapement, with a compensated pendulum. The whole of the work has been carried out by Messrs. J. Smith & Sons, Midland Clock Works, Derby, who have also in hand a similar but somewhat larger clock for Rawtenstall Church, Lancashire.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his inlet and outlet ventilators, amongst other places, to the following:—Fire Brigade Station, Oldham; New Wesleyan Chapel and Schools, Watersheddings, Oldham; and the Methodist Free Church Schools, Oldham—Messrs. Potts, Pickup & Dixon being the architects for the whole of same.

## EWART & SON, 346 EUSTON ROAD, LONDON, N.W.

PATENT COPPER ROOFING.

[Telegraphic Address:—'Geyser, London.'

May be seen in action at the GLASGOW EXHIBITION, No. 677, Class III.

A NEW general hospital has been erected at Portsmouth, the ventilation of which is carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator, and fresh air being admitted by Boyle's improved air inlets.

SIG. G. FOCARDI, the sculptor of *You Dirty Boy*, has just executed a bust of Mr. John R. Whitley, the Director-General of the Italian Exhibition. It is a most speaking likeness, and is now on view in the vestibule of the main building, having been cast in plaster-of-Paris. The artist used nearly a ton of clay in making his model. Sig. Focardi's other pieces on view in the Italian Exhibition include *Happy Age*, *You Raganuffins*, *Daddy's Clothes*, *Sweet Rest*, and *Allegro*. In the present Exhibition there are upwards of 500 different pieces of sculpture.

THE directors of Messrs. Perry & Co., Limited, have resolved to pay on September 1, out of profits, an interim dividend on the ordinary shares for the first six months of this year at the rate of 6 per cent. per annum, free of income-tax, being at the same rate as for the corresponding period last year. The half-yearly dividend on the preference shares will be paid as usual at the fixed rate of 5 per cent. per annum.

COLLINGS'S PATENT BOLTS AND HINGES are well known to most of our readers, as, also, is the fact that Mr. C. E. Hornor, of 120½ Southwark Street, S.E., has for many years been the successor in Mr. Collinge's business. It is about seventy years ago that these patents originated, and ever since there has been a demand for them, a result attained mainly by architects specifying his bolts and hinges for villa gates, park gates, and door fittings, &c. There is scarcely any kind or size not in stock. Although invented so many years ago, there is nothing in the present day to excel the patent bolts and hinges for simplicity, ease of working, and security. A visit to the showrooms, 120½ Southwark Street, will demonstrate both the variety and the high excellence of manufacture.

#### A GREAT GYPSUM QUARRY.

THE opening of the new quarry in the east end of the Cocklakes bed of alabaster, belonging to Messrs. John Howe & Co., is approaching completion, and probably the finest head of alabaster ever seen in this country is now uncovered. The working out of the above bed has practically taken five years,

the works comprising a tunnel through the alabaster 411 yards long, along which it is proposed to run the locomotive, the stuff being hewn in galleries running into the same. In the old quarry this gives, together with the open space, a working face of nearly 600 yards, the bed being about 25 feet thick. The new quarry is to be worked open from east to west, the alabaster being continuous between the two quarries. Architects or contractors desirous of viewing the formation will be shown over upon application at any time.

#### RESPONSIBILITY FOR STATE OF DRAINS.

THE case of *Butler v. Goundry* came again before the Courts on Wednesday in the form of an appeal on the part of the plaintiff from the Court below. The action is to recover damages for misrepresentation as to the drains of a house, No. 148 Brompton Road, which the plaintiff took on lease from the defendant. In March 1887, the plaintiff met the defendant at the house and went over it, and the plaintiff in his evidence said that the defendant told him that he, the defendant, had spent 200*l.* upon the house, 50*l.* of which was for the drains, that he believed the house was the best drained house in Brompton Road, and that the drains were taken up about a year and a half ago and put in order. The plaintiff made particular inquiries about the drains, as he had suffered from typhoid fever. Upon July 4 the plaintiff went into the house, and soon afterwards he, his wife, and his servant were attacked by symptoms of typhoid fever. The sanitary inspector was called in, when he found that the drains, which were brick drains, were very defective, and that the soil leaked through and soaked into the ground. The plaintiff was obliged to leave the house and have the drains put into repair. The defendant's case was that he went into the house two years before, that he and his family lived there in good health, as did also the occupiers before him, that the drains were flushed and opened and repaired by a builder a year and a half before the plaintiff took the house, and that he told the plaintiff that he believed the drains, for old brick drains, were in good order, and that they did their work well while he was in the house, and that therefore he had reasonable grounds for believing, and did believe, that the drains were in good order. The case was tried before Mr. Justice Mathew, when the jury found for the defendant. The

Divisional Court (Mr. Baron Huddleston and Mr. Justice Charles) refused a new trial. Hence the plaintiff appealed.

Counsel for the plaintiff asked for a new trial on the grounds of misdirection, and that the verdict was against the weight of evidence. It was argued that Mr. Justice Mathew really directed the jury that the question was whether the defendant intended to cheat the plaintiff. There was no charge of actual fraud against the defendant. The true question was whether or not the defendant had reasonable grounds for supposing his representation to be true. In this case the judge did not put that question properly before the jury. They referred to *Peek v. Derry* (37 Ch. D. 541).

Counsel for the defendant were not called upon.

The Court dismissed the appeal.

Lord Justice Lindley said that the summing up was perhaps addressed a little too exclusively to the fraudulent aspect of the case. But the Court had to consider whether there was substantially a misdirection, and whether if there was it affected the result of the case. The judge called the jury's attention to the law laid down in *Peek v. Derry*. The defendant, it was clear, did make some statement that the drains were in good order. It seemed that the drains had been opened a year and a half previously, and an obstruction was cleared away and the drains flushed. The drains were then closed, and there was no sign of anything wrong. It was impossible to say that the defendant made this statement without reasonable ground for believing it to be true. The statement was, in fact, untrue, but it was honestly made. He did not think that there was any substantial misdirection, though the direction fell short of what was desirable; but, even if there were, in his opinion no object would be gained by sending the case down for a new trial.

Lord Justice Bowen concurred.

#### STEEL IN FOUNDATIONS.

THE use of steel rails for the foundations of large buildings has long been followed in the spongy soil of Chicago. Some of the more recent large structures have combined the use of steel beams with rails, notably the Edison Electric Light Company's building and the great auditorium in which the National Republican Convention has just been held. The Tacoma building, now being erected on the corner of Madison and La Salle Streets, under the direction of Holabird & Roche, architects, is the first to use steel beams exclusively for foundations.

This building will be twelve storeys and an attic in height, and is intended for offices. Its walls will therefore be very massive, and the partitions will be supported on large pillars built up from the ground. The foundations for the walls and pillars consist, first, of a bed of concrete 2 feet thick; second, of steel I-beams, of different dimensions, according to circumstances, crossed wherever necessary; and third, of cast-iron plates in the case of the columns. The beams stand on edge, are placed close together, and are long enough to extend from 6 to 7 feet outside of the columns. They are enveloped in concrete after being placed in position, to guard against oxidation, and also to secure further rigidity. Over 120 tons of steel beams will be required for the foundations alone of this building. They were adopted in preference to steel rails, because their aggregate cost is about one-third less, as several tiers of steel rails would have to be used to secure the stiffness of the beams, thus more than covering the difference in the cost per ton.

#### RAILWAY BRIDGES IN DUBLIN.

At the meeting of the Dublin Corporation on Monday, letters were read from the Dublin, Wicklow, and Wexford Railway Company, relative to the difference which has arisen with the Corporation as to the plans for the viaduct across Beresford Place, suggesting that the matters in dispute be referred to Mr. B. B. Stoney, C.E., and requesting a reply by the 25th inst., failing which the company will take it that the Corporation object, and the company will at once apply to the Board of Trade to appoint an engineer.

Mr. Robinson, architect, said that as one of the committee appointed in this matter, he wished to say that he believed the railway company had not treated the committee fairly. The general design of the bridge was objected to. In regard to the suggestion to appoint Mr. Stoney, that gentleman was beyond doubt an engineer of great ability, but owing to his connection with the Dublin Port and Docks Board, which to a certain extent had favoured the Loop Line, and the members of which were to a certain extent identical to members of the two railways, he would suggest that Mr. Cotton, engineer to the Board of Trade, or Mr. Strype should be appointed.

Mr. Dillon described the design as patchwork, and said it was wholly unsuitable. It was an outrage on the city for the railway company to propose such a hideous structure. He would suggest that the matter be left to the Board of Trade.

Alderman Winstanley objected to the design, but was willing to leave the matter to the Board of Trade.

Sir George Owens said that there was not a man of higher reputation in the city than Mr. Stoney, and he believed he would be incapable of being influenced by any sinister motive.

Mr. Doherty said that an engineering matter he would willingly leave to Mr. Stoney, but, seeing that he was the engineer who advised the Port and Docks Board not to accede to the request of this Corporation to have the bridge taken on the other side of the Custom House, he believed it would be wrong to place him in the invidious position of being arbitrator between the Port and Docks Board, the railway company, and the Corporation.

Sir George Moyers had no objection to the appointment of Mr. Strype, though he thought the matter should go to the Board of Trade. The bridge was made of lattice-work, and was ornamented with shamrocks and pike heads.

Mr. Robinson proposed that Mr. Strype be suggested as arbitrator. There should be no advertisements on the bridge.

Alderman Dillon said that the company was bound to put up an ornamental structure, and could not put advertisements upon it.

Mr. Robinson's resolution to suggest Mr. Strype was adopted.

#### LICHFIELD CATHEDRAL.

THE Dean of Lichfield appeals for aid towards the restoration of the lady chapel, which is now making good progress. The work is tedious and costly in consequence of the dilapidated condition of the structure, patched up as it has been from time to time with curious and clumsy applications of Roman cement. Moreover, the great ornamental feature of the lady chapel, the stained glass of the sixteenth century, brought over by the late Sir Brooke Boothby to this country from the Abbey of Herckenrode, near Liège, at the beginning of the present century, and presented by him on most generous terms to the Dean and Chapter of that day, is in a very insecure condition, in consequence of the perishing state of the leadwork which holds it together. Hence it has been necessary for the sake of this precious glass, as well as for the thorough repair of the mullions, carefully to take down these windows, one by one, and re-lead them, an operation requiring great care and patience. Three of these windows have already been re-leaded

and replaced, and a fourth is now nearly completed. Externally the windows of the lady chapel are separated by buttresses of excellent proportions, the whole work being originally of the Late Decorated period. Each of these buttresses carries two niches, and it is a part of the design of the Dean and Chapter to fill all these niches, as the work proceeds, with figures of female saints of the Old and New Testaments, each buttress carrying an Old Testament saint in the upper niche and a New Testament saint in the lower. Two of the buttresses on the south side are already restored, and their niches occupied respectively with figures of Rachel and Phœbe and Miriam and Lydia. Two more figures, those of Deborah and Martha, will shortly be in their niches. But there still remain ten more niches for which figures will be needed; and it is earnestly hoped that contributions will be made towards this object by those who admire the cathedral of Lichfield, and appreciate what has been done within the last half century for its restoration. The estimated cost of each figure is 30*l.*, and amongst those which will next be wanting are the figures of Rebecca and Elizabeth, Rizpah and Mary (the sister of Lazarus), Ruth and Anna.

#### REGISTRATION OF PLUMBERS.

A PUBLIC meeting was held on Monday in the lecture-hall of the Free Library, Liverpool, to consider the registration of qualified plumbers as a measure for securing the higher efficiency of plumbers' craftsmanship. Mr. J. B. Smith, the chairman of the Health Committee, presided, and the building was filled in every part.

The Chairman, in explaining that the meeting had been convened under the guidance of the National Worshipful Company of Plumbers, said its object was to enable the public to distinguish between qualified and unqualified plumbers. A householder might employ a man who called himself a plumber, and who might be ignorant of his business, and it was therefore desirable that means should be found to enable anybody wishing to engage a plumber to procure a qualified and efficient one. This registration movement affected the Health and Water Committee of the Liverpool City Council, and as chairman of the first-named body he wished to express the desire of his colleagues as well as himself to see the present system improved. The question mainly affected the drainage,

and here he might say Liverpool had not been behindhand in sanitary reform. The city was the first in the kingdom to go in for a private Act to remedy sanitary defects, and one result had been the abolition of the old midden and cesspool system in favour of water-closets. But unless drain-pipes were properly constructed and soil-pipes properly placed, ventilated and trapped, water-closets were a source of danger. The Health Committee for that reason were anxious to see the best plumbers employed. They wanted plumbers not only to work with their hands, but with their heads; and when they went to a house to correct one fault it was undesirable they should leave another. While there might be many ignorant plumbers he was quite sure there were many honest and capable ones, and what was required now was to make plumbers as a body thoroughly efficient.

Dr. J. Stopford Taylor was of opinion that the work in which they were engaged was one of a most valuable character, and one that would conduce very materially to the public health. It was the unanimous opinion of medical men that the registration of plumbers should become general and universal throughout the whole country. Speaking for himself, having now been connected with the Health Committee for nearly a quarter of a century, he might say that while he had seen a great amount of good plumbing, he had also seen a large amount of defective work, which had produced much discomfort and, in many cases, death. With such evidence the medical profession had unanimously adopted the sentiment that the registration of plumbers was absolutely necessary and essential for the public health. There were several reasons to account for the bad plumbing that was done, and it might be one reason was that there had been an increase in the system of competition for contracts. In all estimates for the erection or repair of buildings, he held that none but registered plumbers should be employed. He did not want to see a man one day whitewashing the ceiling, the second day hanging up the paper, the third day brushing the wall, and the fourth day tinkering with the water-closet. Those were the men who promoted sickness amongst the public at large, and brought discredit on the whole plumbing trade. It was for that reason he appreciated very highly the action of the plumbers in visiting Liverpool to form a council where plumbers could be taught their technical business, and instructed in those sanitary measures which it was their duty to carry out by fair and honest work. He moved:—"That this meeting of master and operative plumbers and others of the North of England, having

heard the statement as to the action of the Worshipful Company of Plumbers, London, with the view of bringing about a national system of registration of plumbers, resolves (1) that a district council for Liverpool, Birkenhead, West Lancashire, Cheshire, Denbigh, Flint, Carnarvon, and Anglesey, in union with the London Plumbers' Company, be formed to carry out such a system for that district; (2) that the said district council shall consist of representatives from the master plumbers, the operatives, and the public."

Mr. Henry Duckworth, in seconding, afforded an illustration of the impetus which the Liverpool School of Science was giving to the movement, and stated that his association would continue to do all it could to elevate and assist the plumbing trade. The motion was supported by

Mr. Malcolm Guthrie, who submitted that there was no worse economy than bad plumbing. There were some kinds of work which a householder could see were done badly or well, but plumbing was out of sight in most places, and the results of it were not so manifest.

The resolution was carried with one dissentient.

A district council was then formed and representatives selected from the master plumbers, on the proposition of Mr. T. H. Milne, seconded by Mr. Anderton; from the operatives, on the motion of Mr. A. White, jun., seconded by Mr. G. H. Morton; and from the public at the instance of Dr. Carter, seconded by Dr. Vacher. The new council, on the resolution of Dr. Steeves, seconded by Mr. Coard S. Pain, were afterwards empowered to frame rules to carry on the movement.

#### ARTESIAN WELL-BORING.

At Headly Park, near Liphook, Hants, the residence of Mr R. S. Wright, an overflowing artesian spring has recently been tapped by a tube well bored by Messrs. Le Grand & Sutcliffe, of London. The water rises from a bed of lower greensand underlying the gault clay, and overflows at 9 feet above the surface at an altitude of 210 feet above O.D. At first the overflow was at the rate of about 200 tons of water a day, but as the spring developed itself the quantity increased to 290 tons per diem; and upon the tube being cut down 2½ feet the overflow has further increased to no less than 480 tons, or 110,000 gallons daily, which would be equal to supplying a population of 4,400. The water, which has been analysed by Dr. Tidy

and Mr. Bernard Dyer, is one of the purest quality, and it is considered that a very large supply could be obtained without materially lowering the head of water by putting down a series of tube wells.

#### BUILDING BY-LAWS.

A CASE has been tried in Manchester, before Mr. Justice Stephen, in which the Corporation of Bury were the defendants. It related to the interpretation put upon the local by-laws. The plaintiff, Mr. Joseph Newbold, is a large owner of property in Bury, and he, in March of last year, sent into the Bury Corporation plans of five houses and shops he proposed to build in Stanley Street. The plans came before the plans committee and the paving, sewerage, and streets committee of the Corporation. They were finally disapproved as not being in accordance with the by-laws, and notice of such disapproval was sent by the borough surveyor to Mr. Nuttall, Mr. Newbold's architect. Mr. Nuttall submitted an alternative plan, which, however, the Corporation could not approve. The plaintiff, believing that he was right as to his plans, proceeded with his buildings. The Corporation extended the time within which the plaintiff should make the necessary alterations, but he did not make them, and the defendants alleged that they had no alternative but to go in and pull down portions of the back of the premises, which, they said, constituted the infringement of the by-laws. The by-law provided that buildings used as dwelling-houses should have in the rear or at the side a properly enclosed yard, exclusively belonging thereto, to the extent of at least 150 square feet, free from any erection thereon above the level of the ground, and that the distance between every such building and the opposite property at the rear or side should be 20 feet. Parties were agreed as to the point from which they were to measure in providing this required space, and the difficulty between them was as to the point at the other end to which they were to measure—in other words, what was "the opposite property." It appeared that behind the houses in question there was another piece of land belonging to the plaintiff, and Mr. Ambrose contended that the words "opposite property" meant the property of some other person.—Mr. Bigham, for the Corporation, argued that the by-law did not mean that the opposite property must belong to some other owner, but it meant that the yard, with the wall at the end of it, should be 20 feet long, and that there should be 20 feet of open space between it and

the opposite property. The property to which they were to measure was the property that abutted upon the yard wall, never mind to whom it belonged.—Mr. Nuttall, architect, was called, and said he did not receive a letter from the borough surveyor of Bury stating the grounds of objection to the passing of the plans, although the copy-letter book being produced, he did not doubt that the letter was written.—Mr. Ambrose said the plaintiff's statement of claim stated that the property was taken down negligently.—The Judge said that was a question of damage, and could not affect the question of right.—Mr. Bigham said that if the buildings had been taken down carelessly, and damage had been done thereby, the defendants were liable for that, whether they were within their right or not. That point, he understood, was referred with the question of damages.—The Judge said he thought there was an order disapproving of the proposed buildings, and also that Mr. Nuttall must have received notice of that disapproval, although he might probably have forgotten it. The whole question turned upon the by-law, and he thought the plaintiff should comply with that by-law. Judgment would be entered for the defendants.

#### FLOATING STEAM FIRE-ENGINE.

A COMPLETE self-propelling floating steam fire-engine, constructed by Messrs. Shand, Mason & Co., of London, for the port of Buenos Ayres, has just been shipped on board the *Asiatic Prince*, South-West India Dock. The vessel, which is named after the President of the Argentine Republic, the *Presidente Juarez Celman*, was tested by Captain Shaw, C.B., chief officer of the Metropolitan Fire Brigade, on the 4th instant, when its speed compared favourably with that of the *Arrow*, one of the swiftest launches belonging to the brigade, and at the measured mile its actual rate was found to be over eleven miles an hour. It is 60 feet in length and 11 feet across the beam, and is propelled by means of two inverted steam-engines working direct on the screw shaft. The steam fire-engine is capable of delivering 1,450 gallons per minute, and the boiler of raising steam to full working pressure from cold water in about eight minutes. There are two cabins, the forward one being fitted for the accommodation of three officers, and the after one for eight men. The *Presidente* is built on the same lines as a floating steam fire-engine constructed by Messrs. Shand, Mason & Co. in 1882 for the Brazilian Government for

## STEEL STRONG ROOMS, DOORS, LOCKS, AND SAFES

TO THE BANK OF ENGLAND AND ITS BRANCHES,

*Including the New Law Courts Branch now in course of Erection.*

### IMPORTANT COMMUNICATION.—WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed) WILLIAM WHITELEY.

Rio de Janeiro, and it is in consequence of the successful use of the latter that the boat described, which is larger and with more powerful engines, has been built. The Metropolitan Fire Brigade have four fire rafts fitted with exactly similar engines, but of smaller size. For shipment the machinery was taken out of the vessel, and packed in separate cases, the hull going out in one piece, so that on arrival at its destination the whole may be readily fitted together again.

#### SEA-SICKNESS PREVENTED.

A CLEVER and simple invention, that bids fair to be thoroughly efficacious in the prevention of sea-sickness, is now being exhibited at the Italian Exhibition by the inventor, Signor Dom. Valli, of Bergamo. M. Valli suspends a chair or couch to the ceiling of the ship, and the fixed centre of gravity is maintained by means of a ball swivel-joint, so that the equilibrium of the chair is always maintained, no matter how much the vessel may pitch or roll. The inventor subjects his system to severe rocking tests, imitating the action of a ship at sea, and the passenger or experimenter seated in the chair remains perfectly quiescent. Those who are concerned in the fitting out of sea-going vessels would do well to inspect this simple, and as far as we can judge effective, remedy against the nauseous horrors of *mal de mer*. The great recommendation of the plan is its simplicity, as the invention is based on a well-known natural law.

#### WATER OF LEITH PURIFICATION SCHEME.

A MEETING of the joint committee of the Town Councils of Edinburgh and Leith was held on Friday last in the Council Chamber to receive the report of the sub-committee on the Water of Leith Purification Scheme. The committee recommended generally the adoption of No. 3 plan, which provides for the effectual drainage of the whole district of Edinburgh and Leith from Coltbridge to the sea, at a cost of between 50,000*l.* and 60,000*l.*, exclusive of compensation. Further, that in order to provide for the drainage of the landward district above Coltbridge, the culvert will require to be made 3 inches larger, at a cost of 5,000*l.* The sub-committee also recommended that Messrs. D. & T. Stevenson be retained as consulting engineers for the scheme. In regard to the alleged

pollution of the Water of Leith above Coltbridge, and with regard to the action now pending in the Courts, the committee instructed that a communication enclosing the report of the engineers and relative plan be sent to manufacturers, local authorities, and others interested. Without prejudice to the pending action, it was proposed to ask them if they had any suggestions or proposals to make on the matter. The report referred to will be laid before the corporations as soon as convenient, and a remit will be asked to the joint committee to prepare Parliamentary plans and notices giving effect to the same.

#### DINNER TO MASTER BUILDERS IN LIVERPOOL.

THE Master Builders' Association of Liverpool, on Wednesday, entertained at a banquet at the North-Western Hotel, Lime Street, a company of representative members of the National Association of Master Builders of Great Britain, who are at present in Liverpool in connection with a visit to the Manchester Ship Canal Works at Eastham. Mr. C. N. Green, president of the Liverpool Association, occupied the chair, and among the numerous company who sat down were Mr. George Burt (president of the Institute of Builders of Great Britain), Colonel Stanley G. Bird (London), Mr. R. Neill (president of the National Association), Mr. Edmund Kirby (president of the Liverpool Architectural Society), and Messrs. Southern, Brown, and Darmburg (Manchester), Bowen, Sapcote, Barnsley (Birmingham), Bradney (Wolverhampton), Moulson, Houldsworth (Bradford), G. Cowlin, Church, Brock (Bristol), Jones, Holmes, White, T. Tomkinson, T. Jones, G. Atkin (Liverpool), J. Storrs, Turner (Ashton), Crutchley, Townson, Briscoe (Bolton).

After dinner the loyal toasts were drunk.

The Chairman next proposed "The Army, Navy, and Reserve Forces."

Colonel Stanley G. Bird, in responding, said he was glad to hear that the matter of national defence was exercising the minds of the people of Liverpool. National defence was a matter of such supreme importance that one day we would wake up to find we had been awful fools not to have listened to those who told us what we had to expect. As regarded the defences of Liverpool, he hoped the public of the city would not be satisfied until their splendid port was protected against attack.

## THE FIRE AT THE GRAND THEATRE.

The destruction of this fine Building might have been PREVENTED by the USE of GRIFFITHS' "PYRODENE," which would have made the WHOLE of the SCENERY, STAGE, and its SURROUNDINGS—in fact, THE THEATRE in every part—ABSOLUTELY NON-INFLAMMABLE.

### GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

AND

### GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE. NON-POISONOUS. ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 2<sup>d</sup>, 1887.

DEAR SIR.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co, Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIR.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C., LONDON.

The "Architects, Surveyors, and Engineers" was proposed by Mr. George Burt, and responded to Mr. Kirby, who personally and as an architect expressed himself exceedingly pleased to meet the visitors.

Mr. Edward Manisty, one of the engineers of the Ship Canal, also acknowledged the toast. Speaking of the Canal scheme, he said the indomitable pluck that had been shown by the Manchester men in carrying their Bill through Parliament, the great skill displayed by their engineer in drawing up his plans, and the extraordinary organising power of the contractor would all be appreciated by the Association in their visit to the works, and would enable them to form some opinion on the prospects of the scheme. No doubt in all such undertakings there would be great and unexpected difficulties, but when they bore in mind who were the men at the head of the scheme, and when they saw what a few months' work had done, they would agree with him that there was every prospect of the promoters standing alongside their docks in Manchester and seeing the big ocean steamers coming in. He was speaking, not to commercial men, but to builders, architects, and engineers, who had no animus, but looked upon the matter as a gigantic scheme, that would enable England to keep her position as the foremost nation in the manufacturing world. Anything that would enable her to do that would command the sympathy of all present. The canal would be larger than any yet constructed, would be 120 feet wide at the bottom, and would have 25 feet depth of water all the way to Manchester. They believed it to be the beginning of an enormous amount of work for engineers and contractors all over the world.

"The Visitors" was proposed by Mr. A. G. White, and responded to by Mr. Robert Dennett, of Nottingham.

The Chairman, amidst applause, gave "The National Association of Master Builders." They looked upon that Association, he remarked, as the head of their provisional associations. They submitted to it all matters of moment connected with the building trade, and had always received its cordial co-operation and kind advice.

Mr. Neill, in responding, after thanking the Liverpool Association for their hospitality, said the National Association, although they existed for themselves first, and for the public afterwards, were proud to think that they did a great work. They were the largest labour-employing community in the kingdom. The building trade had more to do with labour generally throughout the kingdom than any other industry, and this was a fact that the country should recognise. Alluding to

the remarks of Mr. Kirby, he thought that between architects and builders there ought to be no antagonism, and if the architect were a gentleman, as most architects were, he wanted the work well done, and would pay a decent price for it, but when they trusted themselves implicitly to him he would see that they got value for what they gave. He thought he was right in saying that as a rule architects treated them fairly and well.

The concluding toast, "The Liverpool Master Builders Association," was proposed by Mr. Cowlin, who said its members were practically the fathers of the National Association, and had maintained towards the latter an unswerving loyalty.

The toast having been cordially drunk, Mr. Charles Tomkinson responded, and the proceedings concluded.

### THE BELGIAN IRON TRADE.

THERE is a brisk demand in the Belgian market for rolled iron, and especially for beams. There has been a slight slackening in the demand for small iron, but as it is impossible to lower prices under the existing conditions of production, the quotations of the syndicate are maintained. Some surprise has been expressed in consequence of preparations to increase the output having been made at several large Charleroi works, notwithstanding complaints that the existing production is rather excessive than the reverse. It is pointed out, however, that the works in question are those in which large iron beams for building purposes are produced. For these beams the demand tends to increase year by year. For some time past, it is stated, an actual difficulty in promptly supplying the orders has been experienced, but the Belgian ironmasters have been deterred from taking steps to increase their capacity of production by apprehensions of English competition. At present, however, the Belgian makers have reason to think that the English iron manufacturers have abandoned competition with them in this branch. The apprehension that the production of mild steel by the dephosphorisation process would prove an obstacle to the development of the iron beam industry, has also caused the Belgians to hesitate. England, it was argued, beaten in the manufacture of iron beams, seemed inclined to base its hopes on the production of steel beams, and in Germany the steel beam manufacture has made considerable

SQUARE), LONDON, W.

progress. In Belgium, however—in consequence, it is hinted, of the Angleur Company, which holds the Thomas patent, having endeavoured to impose unacceptable conditions on the other Belgian establishments desirous of applying the process—this has not been the case, and it is now asserted that mild steel beams cannot compete economically with iron beams. In any case the development of the steel industry is apparently no longer regarded as a danger for the Belgian iron beam manufacture. For the rest, the Belgian steelworks are generally well employed, but business in rails is scarce, and the market is depressed.

#### METROPOLITAN SEWAGE.

ON Tuesday last a party of members of the Society of Engineers were enabled to examine the new Precipitation Works at Barking Sewage Outfall, constructed by the Metropolitan Board of Works. At the present time the whole of the sewage of the metropolis north of the Thames is conveyed to Barking Creek by three culverts, each 9 feet high by 9 feet wide, and is, in the first instance, delivered into a covered reservoir divided into four compartments, and altogether extending over an area of 9 acres. The sewage is stored in this reservoir during eight hours of each tide, and discharged into the river at high water at the top of the ebb. This reservoir is situated on the east side of the sewer, and immediately adjacent to the river bank.

The new works consist of covered precipitation tanks adjacent to this reservoir on its north side, and occupying the ground between the outfall sewer and Barking Creek, an area of between 10 and 11 acres. There will be thirteen of such tanks, each 31 feet 6 inches wide, and averaging about 1,000 feet long. Communications will be made between the outfall sewer and each of these tanks, each fitted with two penstocks, so that communication may be opened or shut off at pleasure.

The sewage will be admitted into each of the tanks in succession, and after being allowed to remain quiescent for a sufficient time to admit of the deposit of the solids in the sewage, the precipitation of which will be expedited by the admixture of 3·7 grains of lime and 1 grain of proto-sulphate of iron per gallon, the effluent will be run off over a weir, which will fall as the water in the tank lowers, so that the top film of the effluent only will be taken off, and the tank emptied gradually, so as to prevent any disturbance of the solids by the operation.

The effluent after flowing over the weirs (of which there will

be ten in each tank) will pass into culverts carried transversely under the tanks and extended, some into the compartments of the existing reservoir, and some into a chamber under the outfall sewer through which, at present, the sewage is discharged into the river from the existing reservoirs. When the level of the tide will admit the effluent will be discharged through this chamber direct into the river; but when the water in the river is too high to admit of this, the effluent will be conveyed by the other culverts into the several compartments of the present reservoir, and stored there until the level of the water in the river will admit of its discharge.

When each compartment is emptied of the effluent the sludge, which will be in a semi-liquid state, will be discharged through culverts passing under the outfall sewers into a collecting culvert, from which it will be conveyed by pipes into a receiving well or sump, and pumped into a series of twelve tanks placed side by side, and situate between the outfall sewer and the river. These tanks will each be 20 feet wide and 140 feet long, will cover an area of over an acre and a half, and, like the precipitation tanks, will be covered so as to prevent nuisance. The sludge will be allowed to remain quiescent in them so as to allow of a further precipitation, and the effluent water will be discharged over weirs into a culvert which will convey it into a store under the tanks, from whence it will be lifted and discharged through pipes to the liming station, there to be mixed with lime which is used for precipitation. The settled sludge remaining after this further precipitation will be discharged through culverts into a sludge store situate under the tanks, and will be lifted thence and conveyed by pipes along a jetty, and to a landing stage to be erected in the river, and there discharged into ships which will convey the sludge to sea. In the event of the ships being detained by stress of weather, there is a further store for sludge at a lower level extending under the whole of the area occupied by the upper stores.

On the north side of these sludge-settling tanks will be erected engine and boiler-houses and workshops in connection, to contain engines and machinery for lifting the sludge into the settling tanks, and the settled sludge into the ships, as well as for pumping the sludge effluent to the liming station.

The lime for assisting the precipitation of the solids of the sewage is introduced into the outfall sewers at a point about 700 yards, and the proto-sulphate of iron about 530 yards above the precipitation channels. The liming station will comprise a lime store, floors for slaking the lime, and six tanks for mixing

### BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

MANCHESTER ADDRESS—

**HEIGHWAY & SON, 19 JOHN DALTON STREET.**  
ESTABLISHED 1769.

the slaked lime with the effluent water from the sludge-settling tanks, or with sewage taken direct from the outfall sewers; an elevated lime-water tank or reservoir built above the lime store, and into which the lime-water will be lifted by pumps, for which machinery and the requisite engine and boiler-houses will be erected adjacent to the lime stores. From this elevated tank the lime-water will be conveyed to and injected into the sewage passing along the outfall sewers, through cast-iron injectors placed in the sewers. There will be means of turning the lime-water into any one of the three lines of sewers and of regulating the supply by means of sluice-valves fitted to the pipes leading to the injectors. The injectors consist of cast-iron chambers 4 feet 6 inches in length, 6 inches wide, and 6 feet in height, fitted with a number of nozzles, through which the lime-water will be injected and mixed with the volume of the sewage as it flows past.

The iron-water station comprises timber sheds for storing the proto-sulphate of iron, a mixing shed in which the iron will be crushed and mixed with water, an engine shed to contain engines and machinery for crushing the iron and mixing it with water, as well as for raising water for boilers and into mixing tanks. The iron-water will be conveyed by stoneware pipes, carried underground and along the top of the outfall sewer into a service tank, from which it will be carried by pipes into each of the three outfall sewers, and injected into the sewage through perforations in a pipe fixed vertically in each of the sewers. As with the lime-water, there will be appliances for regulating the supply of iron-water to each of the sewers, to meet the varying requirements of the discharge.

There will be a large settling pond, covering an area of  $1\frac{1}{4}$  acres, situate near the river, divided into six compartments, each 60 feet by 60 feet, and about 7 feet deep, into which water will be received from the river and allowed to settle; the clear water being afterwards filtered and used for the supply of the several boilers, for slaking the lime, and for mixing with the proto-sulphate of iron.

The jetty, which will extend 576 feet into the river from the present river bank, will be 15 feet wide, and will be a timber structure supported upon piles. At the river end of the jetty will be a timber landing stage 300 feet in length and 20 feet wide.

The iron pipes for conveying the sludge to the ships will be carried under the platform, and will be furnished at the end with a delivery pipe, socketed to admit of a vertical movement, so as to discharge the sludge into the ship at varying levels of

the tide. A tramway will be laid along the full length of the jetty connecting it with the whole of the works.

The contract for the works includes the erection of twelve cottages and a residence for the superintendent, and the diversion of the Old Galleons sluice and ditch, which is one of the main sewers under the jurisdiction of the Essex Commissioners of Sewers. There will be a large quantity of surplus earth from the excavations which will be used in forming the banks for the tramways, and in raising the general level of the ground, which is now 6 or 7 feet below the level of Trinity high water. The works extend over an area of about 50 acres, the quantity of sewage to be dealt with will amount to about 90,000,000 gallons per day, and the quantity of lime to be used in precipitation to 23 tons per day.

Two contracts have been entered into for the execution of the works—one with Messrs. Mowlem & Co., for the general work, for 4c6,000l, and the other with the Glenfield Company, of Kilmarnock, for engines and machinery, for 42,567l.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

10174. George Robert Rollason and Charles Arthur Rollason, for "Bath and lavatory basin fittings." July 13, 1888.

10177. Joseph Samuel Orton, for "Improvements in raising and supporting venetian blinds, and other similarly accumulating weights." July 13, 1888.

10180. Joseph Henry da Fonseca, for "Improvements connected with water-closets and urinals." July 13, 1888.

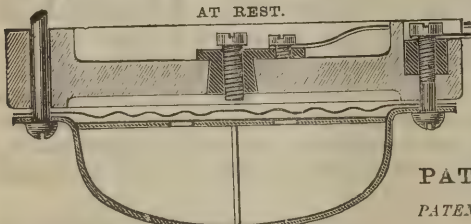

10219. Robert William Gamble, for "A new or improved combined door-spring and alarum." July 13, 1888.

10247. George Harris Haywood, for "Improvements in kitchen ranges." July 14, 1888.

10273. Robert J. Thompson, for "A cord or rope fastener or grip for window-blinds." July 16, 1888.

10288. Zachariah Pack and James Pack, for "Improvements in brick-moulding machines." July 16, 1888.

VOLUME XXXIX. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.

Office: 175 Strand, London, W.C.

10298. "Improvements in and apparatus for curing smoky chimneys, and preventing down-draught in flues, open and other fireplaces." July 16, 1888.

10312. George James Snelus, Thomas Gibb, John Cameron Swan, Herbert Smith and William Whamond, for "Improvements in and connected with the manufacture of cement." (Complete specification.) July 16, 1888.

10321. George Lee, for "Improved apparatus for heating greenhouses and other buildings with gas." July 17, 1888.

10343. John Robinson Crossthwaite, for "Improvements in the combination of materials employed in the construction of chimney-pieces, mantel-pieces, or the like structures." July 17, 1888.

10358. Pierce, Butler and Pierce, for "Improvements in heating apparatus for dwelling-houses, factories, and the like." July 17, 1888.

10409. Samuel Williams, for "Bolts for doors and other purposes, called Williams's Improved Tower Bolt." July 18, 1888.

10442. Fred. Lewis Lawrence, for "Improvements in the construction of frames for pictures, mirrors, panels, and similar purposes." July 18, 1888.

10447. William Parkes and Charles Wakeman, for "An improved sectioning set square for drawing equidistant parallel lines in any direction of variable pitch." July 19, 1888.

10448. George Michael Asher, for "Improvements in drawing-pens." July 19, 1888.

10456. J. E. Steevenson and Sylvanus Eddington, for "A mould for making and pressing bricks." July 19, 1888.

10459. William Harte, for "A combined window fastener for sashes and for locking windows when opened for ventilation." July 19, 1888.

10460. Wm. Clark, for "A horizontal condensation bar in combination with an improved metallic sash-bar for glass roofs and similar structures." July 19, 1888.

10467. George Holmes, for "Improvements in night latches and other spring locks." July 19, 1888.

10473. Julius Schlesinger, for "Improvements in the manufacture of cement." July 19, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

5169. William Bracewell and William Hayhurst, for "An improved flooring cramp." April 7, 1888.

6091. Richard Fleming, for "An improved combined shutter and sun blind." April 24, 1888.

8266. Frederick James Burton and James Palmer Robertson, for "An improved window sash-fastener." June 6, 1888.

8599. William Palmer, for "An improved T-square." June 12, 1888.

8685. Alexander Frederick White, for "Improvements in hot-water apparatus heated by gas." June 13, 1888.

8831. Edwin Chatham, for "A new or improved apparatus for crushing and mixing mortar." June 16, 1888.

8832. George Henry Leane, for "Improvements in the method of constructing buildings and works in alluvial soils." June 16, 1888.

9053. Thomas Hill, for "Improvements in means for connecting knobs and cupboard turns with their spindles." June 21, 1888.

9074. George Frederick Newman (of the firm of William Newman & Sons), for "Improvements in door springs and checks." June 21, 1888.

9138. Francis Joseph James Gibbons, for "Improvements in fanlight openers." June 22, 1888.

9166. Hippolyte Snellot and Hippolyte Raynaud, for "Improvements in the production of iodine and iodine compounds." June 23, 1888.

9176. Claude Marius Duplany, for "Improvements in and connected with fireproof curtains, for preventing the spreading of fire and smoke in theatres and other similar buildings." June 23, 1888.

9273. Charles Bennet, for "Improvements in the method of laying and securely fastening wooden flooring." June 23, 1888.

9466. Thomas Tucker, for "An improved automatic sash or window fastener." June 29, 1888.

9962. William Samuel Cooper, for "Improvements in water-closet structures." July 9, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

5806. Robert Cooper, Herbert Fitzroy Clayton and George Holden Holroyd, for "An improved filter and apparatus connected therewith." April 18, 1888.

#### PATENTS SEALED, JULY 20, 1888.

8266. William Dewhurst Cliff and Basil Edward Peto, for "A new or improved brick or building block." June 8, 1887.

8450. Robert Low, for "Improvements in dovetailing machines." June 11, 1887.

9153. William Fraser, for "A window blind cord-rack." June 28, 1888.

17130. Thomas Robert Shelley, for "Glazing the roofs and sides and other portions of railway stations, conservatories, billiard-rooms, and other structures." December 13, 1887.

4189. John James Jones, for "Improvements in appliances for locking or securing doors, covers, cases, gates, or other means for closing openings, or chains, or links." March 19, 1888.

4431. Frederick John Henderson, for "Improvements in ball valves." March 22, 1888.

4712. Henry Harris Lake, for "Improvements in and relating to lavatory basins, baths, and the like." March 27, 1888.

#### ABRIDGMENTS OF SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in cowls for chimneys and ventilating shafts." T. S. Truss. No. 8917. 1887. These improvements are for both ejecting and injecting cowls, and consist mainly of a circular hollow box about as long as its diameter, and in this box, which is placed over the flue or shaft, are found two chambers, the centre chamber being the receiving chamber, and the outer one the ejecting chamber. The inlet for the smoke to the receiving chamber is thus an orifice made at the bottom of the box, and the outlets for the smoke or air from the receiving chamber are made at equal distances in the division forming such chamber. The run and area of these outlets are about equal to the area of the inlet orifice into the receiving chamber from the chimney.

*Claim.*—Ejecting and injecting cowls for chimneys and ventilating shafts, having receiving and ejecting chambers with curved or bent-mouthed inlets and outlets thereto or therefrom,

as arranged and constructed in manner hereinbefore described and set forth.

"Improvements in the construction of iron buildings." L. S. Buffington. No. 7534. 1888.

*Claim 1.*—A building having a continuous skeleton of metal, a covering of veneer, and a non-conducting packing between the skeleton and the veneer for the purpose set forth.

*Claim 2.*—In a building frame a continuous diminishing laminated post formed of layers of metal plates secured together and arranged to break joint, and decreasing in number towards the top. (There are twelve other claims to this patent.)

"Improved means of securing door handles and latch followers to spindles." W. Johnson. No. 3001. 1888. The knob is fitted to the spindle by a longitudinal dovetail connection, which will insure a permanently tight fit of the spindle in the socket of the handle, and prevent play of the handle in any direction.

*Claim 1.*—The herein described means of securing a knob handle to its spindle, consisting of a dovetailed tenon in the socket of the handle fitting in a longitudinal dovetailed groove in the spindle (or *vice versa*) in combination with a cross pin, set screw, or other means of preventing longitudinal motion of the knob on the spindle.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

AUGUST BANK HOLIDAY.—Cheap tickets will be issued by the Great Eastern Railway, *via* the "Harwich route," enabling passengers to visit the Brussels Exhibition, the Ardennes, and Holland. Passengers leaving London and the North on Friday or Saturday can reach Brussels the next morning, and return on Monday, arriving in London and the North on Tuesday. They have arranged, in conjunction with the General Steam Navigation Company, a special excursion to Hamburg, at single fares for the return journey. Passengers leave Liverpool Street Station at 8 P.M. on Wednesday, August 1, or Saturday, August 4, and Parkeston, at 10 P.M., by the General Steam Navigation Company's passenger steamers, arriving in Hamburg on Friday or Monday morning, and return from Hamburg on Wednesday, August 8, or Saturday, August 11, at 10 P.M., or as soon after as tide permits, being due in London on the Friday or Monday morning.

# The Architect.

## THE WEEK.

MR. LORENZ HERKOMER, who died suddenly on Friday last, was a typical craftsman of the old days. He was a wood-carver, whose work was fitted for a cathedral or a palace, but, as he was modest and sensitive, he did not gain the success which he had a right to expect. Latterly Mr. HERKOMER was happy, as he was able to occupy himself on the carving which his son, in order to please his father, had resolved to introduce largely in the new buildings at Bushey. He could follow his fancy, and be as elaborate as he desired, without any apprehension of what might be the commercial value of his labour. His workshop was consequently almost unique, for in it one could see a craftsman enjoying himself like an amateur. He was able to give full play to his ability, with the consciousness that he was helping to add beauty to a home for his descendants, and that they would be the guardians of his best work. Mr. LORENZ HERKOMER preserved the old-fashioned German simplicity and straightforwardness, and, as a specimen of a race of men that is fast becoming extinct, he was no less interesting than as an artist.

THE position of sculpture in this country, and the risks which attend most followers of the art, are suggested by the appearance of the names of Sir JOHN STEELL and Mr. JOHN BELL in the pension list, for sums so small as to make the royal bounty appear a humiliation. The former is to receive 100*l.* a year, whilst Mr. BELL obtains only one-half that sum. Both sculptors have attained prominence, and in their old age are not able to be independent. Sir JOHN STEELL is the author of statues and groups which stand in public places in Scottish towns and cities, and, as a consequence of honours awarded him, it might be imagined that many patrons would give him commissions. But apparently his countrymen preferred to go elsewhere for busts of themselves. Mr. JOHN BELL was the abler artist of the two, and he took a prominent part in all that was done to popularise art some forty years ago. His statuettes, lectures, and writings alike promoted that end. Mr. BELL's larger works, such as his *Eagle Slayer*, *Una and the Lion*, and *Cromwell*, well deserved the admiration they received. His striving for the public good merited a better recognition than it has received this week.

THE decision of the Académie des Beaux-Arts, in respect to the paintings submitted in competition for the Prix, will give more dissatisfaction to the painters, such as MM. CABANEL, BOUGUEREAU, BOULANGER, LEFEBVRE, who were the teachers, than to the competitors. The jury find that not one painting merits the Prix de Rome, and what is still more remarkable, not one is held worthy of the next prize or "premier second grand prix." The highest prize awarded this year is the "deuxième second grand prix," and we are glad to say the winner is the artist who bore the English name, Mr. CHARLES LOUIS MAURICE ELIOT, but who is claimed as a native of Paris, where he was born on September 9, 1862. M. PAUL BUFFET has been granted an honourable mention. The public are disposed to agree with the judges, and the decision may lead to some changes in the system of teaching.

THE condition of the land near the Law Courts in the Strand is more suggestive of a sort of "Tom Tiddler's ground" than of Government property. A stranger would imagine that the place was left to grow noisome things, in order to suggest the character of some of the enactments which are administered in the neighbouring building. Government officials have no sensitiveness about the neglect of Government property, and the Strand enclosure may have been considered as a piece of picturesque ground or natural landscape, and for its preservation we ought all to be grateful. Any one who may have the faculty for enjoying desolation of that kind will do well to hasten to the Strand. There is to be an end to the neglect which was approved during so many years. Some anonymous lover of the amenity of London has offered to pay the expense of transforming the ground, and the Government have accepted the

offer. Whether it is creditable to depend on individuals for the improvement of public property is a question which no one is likely to raise, since all Londoners will be glad of the removal of an eyesore on any terms.

THE interest of the triennial exhibition at Antwerp will be enhanced in the eyes of strangers by the two rooms which are assigned to the works by the late NICAISE DE KEYSER, who was director of the Antwerp Academy, and by the late LOUIS GALLAIT, who was one of the leaders of the Brussels school. Both were figure-painters, but there was a difference in their styles. GALLAIT was more of a Frenchman than DE KEYSER, and, some would say, was less virile. But while the Brussels painter's works were made popular by fine engravings, very few of DE KEYSER's pictures have been reproduced, and his merit is not so well recognised as it deserves.

THE new system of local government for the metropolis may bring many changes, but it is improbable that the building regulations will be soon set aside. The little book of Mr. MARSLAND, the district surveyor, containing all the regulations in force at present, will therefore have more than temporary use. It is arranged in the form which is best adapted for reference. The different regulations relating to one subject are brought together, and an architect or builder will not be obliged to wade through the clauses of the various Acts in order to discover the needed information. From its size the book will not be an encumbrance if carried in the pocket, and it is clearly printed. Mr. MARSLAND's book is likely to supersede more cumbrous books on the subject.

THE death of Mr. FRANK HOLL on Tuesday morning will be generally regretted. He had worked his way to a foremost place by his ability and industry. A member of a family long associated with English art, his success became the more gratifying to his countrymen. In his early works he seemed to give preference to scenes of a rather sorrowful kind, but his marvellous success as a portraitist barred attempts at painting real or imaginary incidents. Mr. HOLL was only in his forty-third year—an age at which many able artists were unable to boast of one success. In so short a life he had gained honours and rewards, and a reputation which will outlast the present generation.

THE resources of the "Librairie de l'Art," which are those of a Government department, were never better utilised than in the *Revue Universelle Illustrée*. This new publication is a marvel of enterprise, for the first number contains one hundred and twenty-eight quarto pages by some of the best French writers, with about forty illustrations. The price is only a franc! The contents are varied, but the majority of the articles have more or less relation to art. The opening story is founded on an incident in the life of GÉRARD TER BORCH. M. EUGÈNE MUNTZ writes with authority about DA VINCI's statue of FRANÇOIS SFORZA, and gives facsimiles of the designs for the work. M. GARNIER—who is one of the authors of the "South Kensington Handbook on French Pottery"—relates the early history of the Sèvres manufactory. M. ADOLPHE JULIEN supplies a memoir of BOIELDIEU the composer. It is illustrated by a lithograph, that is amusing from being a record of the kind of costume which passed for Scottish on the French stage in 1825. M. PAUL LEROI writes with his customary candour about M. EDOUARD DÉTAILLE, an artist whose greatness was first recognised in *The Architect*. The article is illustrated by many of the artist's marvellous sketches with a pen. M. MOLINIER writes about CHARLES SAUVAGEOT, who, out of his savings as a violinist, managed to amass a splendid collection, which he presented to his countrymen. A pleasing song-dance of the Bretons is noted and harmonised by M. TERSOT. Dr. GUERRIER criticises some of the pictures and statues in the Salon from a physician's point of view. Lastly, M. CHAVELIER narrates the legendary history of the Church of Tann, in Alsace. We have not mentioned the articles which probably will have most interest for readers who are not artists. There is a prejudice against French writers, but this new magazine may be safely admitted into any English home, and a more helpful aid to home education it would be difficult to find.

## WATER ENGINEERING.\*

THE whole work of the hydraulic engineer may be said to consist in constructing things which will not allow water to escape from them, and in taking advantage of gravitation to form channels through which water will run from one point to another. Or, to put it in a different form, his science consists in the formation of artificial lakes and streams. A good deal of mystery may be thrown over the work by practitioners, but there is no easier branch of engineering than that relating to water.

It has another peculiarity in the little use which is made of architecture in its operations. The ancient Romans were not masters of the theory of hydraulics, but they formed viaducts, which were among their best works of architecture. In connection with modern waterworks, all that can be called architecture is an occasional tower for the pumping-engine, which is commonly of an absurd form. It is not necessary to go outside London for examples. Neither the conduits nor the reservoirs are more than the work of navvies, and might have been designed by them. In fact, waterworks are more characteristic examples of what navvies can do than the railways.

In this country the designing of waterworks is in the hands of a few specialists, and the man is to be pitied who tries to get plans through Parliament if any of those engineers should be engaged by the opposition. Then it is discovered that the widest experience in construction will not qualify an engineer to design a wall for a reservoir, or to decide on the diameter of a cast-iron pipe. It is necessary that he should have had practice on waterworks. One or more of the experts must be called in at a high fee if a Parliamentary Committee is to be convinced, and, unfortunately, there are few cases in which the approval of committees is not indispensable.

The conditions of practice are suggested to us by seeing Mr. SLAGG's work on "Water Engineering." It is an excellent book, for it does not depend upon the experience of the author, for, as he acknowledges, "he has freely referred to such sources of information as were available to him." But how many men will be able to utilise the information supplied by the pages in this country? In all that relates to the construction of waterworks, and the straightening or deepening of rivers, Parliamentary powers are indispensable, and, as we have said, they are only granted on the evidence of a very few men. Did Mr. SLAGG ever engineer a Bill through the committee-rooms, or does he imagine that if he came forward as the author of a book on "Water Engineering," there would be any value attached in consequence to his evidence? We have known men of equal standing to fail in an attempt of that kind, although no valid objection could be raised against their plans. Parliament, in fact, has in this branch of engineering created a privileged but very small class of engineers who are able to monopolise the commissions, and knowledge is of little avail against them. In this country a man who proposes to devote himself to hydraulics cannot expect to attain a higher office than an assistantship under one of the few experts, and, as a rule, posts of the kind are given to former pupils. In the Colonies there may be fewer restrictions, and a better chance for men who are qualified.

While it is necessary to forewarn novices about the prospects of hydraulic engineering, it must be admitted that there is much fascination about work of that kind. The old Italians who made such elaborate calculations concerning the flow of water and other subjects, were not always men who had charge of works. One of the best books on hydraulics in the English language is Professor DOWNING's, but he never once refers to any experience of his own, and we doubt if he ever saw the simplest work executed in a drain, or the laying of a pipe. He was able to amuse himself with calculations about all that water was supposed to do, and, in a theoretical sense, his labour was not in vain.

Mr. SLAGG does not oppress practical readers with the minutiae in which college professors can revel. He does not introduce mathematics unless in cases where words are

not sufficient by themselves, and his formulæ are always of the simplest kind.

The natural way to commence a book on water engineering would be with the gathering grounds or catchment basins, and then, when the way to obtain an adequate quantity of water was explained, to show how it was stored and distributed. In the book the "embankments of water works reservoirs" are first treated, and the gauging forms the subject of the seventh chapter.

In an embankment for a reservoir the main feature is the puddle-wall in the interior, which has to be efficiently covered in order that none of the water may evaporate through the wall. More care has therefore to be taken with forming a reservoir embankment than with one for a railway, and the part next the water must not only have a greater slope than on the outer side, but the surface must be compacted. The pressure on the banks of a reservoir is seen from the bursting of the reservoirs at Bradfield and Holmfirth, the latter being filled for the first time. According to Mr. BATEMAN's account, "The Bradfield embankment was constructed on ground liable to slide down upon the face of an underlying flag-rock with a smooth surface. But, besides this, the inner part of the bank was of very loose material, and the pressure would be horizontal, the puddle-wall and the outer part of the bank having to bear the whole pressure of the water in the reservoir because the inside slope was permeable by water. The puddle-trench was sunk through the flag-rock into the shale below, but there, on the outside, lay the flag-rock at an inclination of 1 in 4, as smooth as polished marble; and when the pressure came against the puddle-wall the whole thing gave way." A different cause was found by Mr. (now Sir) HENRY RAWLINSON. He considered "that the joints of the pipes were opened by reason of the surrounding puddle sinking in the middle, and allowing water to creep along outside the pipes, and so made a beginning of a more serious run of water, as there were no valves on the inner ends of the pipes; and if such a beginning was made the run of water could not have been controlled, the valves being at the foot of the outer slope of the embankment." Mr. SLAGG believes that the accident arose through the embankment on one side of the puddle-wall being washed away, when the wall would become unable to resist the pressure of the embankment on the opposite side.

The capacity of a reservoir will depend on the quantity of water which must be stored and which must correspond with the number of inhabitants to be supplied. According to Mr. BATEMAN 120 days' supply is sufficient on the western side of the country, and 240 days on the eastern side, but there are places where 300 days' supply may be needed.

There are many things besides the banks to be considered in laying out a reservoir. It is necessary to provide for floods, and for that purpose a large weir has to be constructed with a by-wash to carry off the water. In one case in Staffordshire, where a short weir was used, the water rose 5 feet above the weir, "and if only the accidental occurrence of a wind blowing down the reservoir had taken place at the same time, there can be no doubt that a great disaster would there and then have happened." The question of conduits is of importance. Mr. SLAGG says that for one over 20 inches diameter masonry should have the preference. "A circular conduit 2 feet diameter and half a brick thick would usually be laid at less expense than a pipe of the same size." But in estimating, locality will always count for much.

Sites for service reservoirs are sometimes difficult to find. In Liverpool they are eight miles distant, and in Manchester five miles. Some, of course, have to be covered. In the construction of the tanks greater care is generally needed than with the storage reservoirs, for the latter being in country districts, the damage through bursting would be less than when the accident occurred nearer a town.

Mr. SLAGG describes all the arrangements for the distribution of water in towns, and he has also chapters on subjects of a different kind, such as mills, turbines, &c. But he ought in his next edition to introduce information about the supply to country houses. We have heard of cases where costly mansions were erected without any provision for obtaining water, and where wells were sunk

\* *Water Engineering: a Practical Treatise on the Measurement, Storage, Conveyance, and Utilisation of Water.* By Charles Slagg, C.E. Crosby Lockwood & Son.

nothing was done to test their efficiency. It may have been supposed that the water supply was outside the architect's functions, but the owners of the houses in each case declined to accept that excuse. Mr. SLAGG appears to be of the stuff of which hydraulic engineers are made, and as he writes with an evident interest in his subject, he could add to the utility of his book by the additions we have proposed. It is given to few to carry out works for water supply on a large scale, but the arrangement of a water supply for a country mansion is an everyday affair. All that is contained in the book is informing, and for any one who desires to begin the study of hydraulics with a consideration of the practical applications of the science there is no better guide.

#### MANCHESTER SOCIETY OF ARCHITECTS.

THE following address was delivered by the president at the last general meeting of the Manchester Society:—

Gentlemen,—I regret that circumstances have unavoidably prevented me from addressing you at an earlier period of the year, as the custom of the office to which you have elected me demands. In proceeding to do so, permit me to tender my hearty thanks for the honour you have conferred upon me. Although I cannot hope to rival the ability which has distinguished my predecessors in the conduct of the affairs of this Society, I venture to say that I yield to none in a strong desire for its welfare and the maintenance of its prestige.

The interests of our profession, as of all others in a restless and competitive age, necessitates increasing vigilance. Each succeeding year entails fresh responsibilities, and brings up new questions for settlement. To some of these questions, old and new, I propose to invite your attention; and although I cannot hope to offer much that is novel to your consideration, my remarks may perhaps serve to remind you of the work that lies before us during the year.

At the time when my predecessor in the chair delivered his address, namely, on March 22, 1887, we were looking forward with pleasurable anticipation to the holding of the Jubilee Exhibition in Manchester. I need scarcely remind you that the Exhibition proved a magnificent success, and that it carried out its design of representing the progress made during the Queen's reign in the fine arts, machinery, chemistry, and other industries, with most satisfactory completeness. It must always be a matter of congratulation that our Society (thanks to the initiation and energy of our then president, Mr. Murgatroyd) secured so fine and comprehensive a display of the architecture of the Victorian era. Three of our past presidents, Mr. Waterhouse, R.A., Mr. Redmayne, and Mr. Murgatroyd, were placed on the art section of the general committee, and to the efforts of these gentlemen, especially to the untiring industry of Mr. Murgatroyd, we owe the collection of a perfectly unique and most instructive series of drawings and designs, which showed, as I believe no other Exhibition has yet done, the salient features and the most distinguishing characteristics of the architectural art of the last fifty years.

On referring to the catalogue of the Exhibition, I find that the number of examples was 294, and these were the production of 129 architects. Almost every description of work was represented—ecclesiastical, military, municipal, commercial, and domestic—and the collection comprised not a few of the best known and most remarkable buildings erected during the period covered by the Exhibition. I cannot help thinking, however, that the Architectural Court (so called) was unfortunately situated. The position assigned was entirely unfavourable either to the attractive exhibition of the works, or to their adequate study. It was in that part of the building devoted to organ solos and concerts, and was practically closed for some hours each day during the orchestral and other musical performances. Moreover, the passages were often blocked with chairs, and access to a view of the drawings was frequently uncomfortable and inconvenient. As a consequence, there was probably no section of the Manchester Exhibition which was less seen, or less carefully examined than the Architectural Court—a fact which perhaps accounts for the very little attention it received from the general newspaper press. It is unfortunately the fate of architecture in most exhibitions to be treated with scant courtesy, and thrust almost into the background; and it behoves the profession, not only on their own account, but on behalf of the public (who would take a greater interest in exhibitions of architectural designs if they were made more attractive and instructive) to press their claims to a different treatment than that to which they are ordinarily subjected.

Of the drawings at the Manchester Exhibition, rather more than one-fourth were of buildings in Manchester and its suburbs—a disproportionate number, no doubt, but unavoidable under the circumstances. It is perhaps worth while

recalling the fact that, with the exception of the older churches and chapels and a few public buildings like the old Town Hall, the Royal Institution, the Athenæum, the Concert Hall, and the Chorlton Town Hall—all of which were erected before the Queen's accession to the throne—modern Manchester as we know it is, architecturally, entirely the creation of the Victorian era. Sir Charles Barry was the dominating influence in the decade between 1830 and 1840, and Edward Walters (to my mind one of the most accomplished architects of his time) may be said to have held the same position a decade later. He may be regarded amongst other things as the pioneer of the warehouse reconstruction of the town. Since then the process has been going forward with ever-accelerating impetus, until within the last few years. The advance of our art in Manchester was fairly reflected and illustrated in the Exhibition, though possibly, if the historic idea had been more closely kept in view, the display might have been made more adequate. Beyond noting and enforcing the fact of that advance, it is happily no part of my duty, even if I had the ability, to draw any conclusions as to its general character, or to attempt to estimate its quality in comparison with architectural progress in other parts of the kingdom. It will be more within my scope and perhaps more useful to direct attention to some things which at the present time obstruct our efforts. More than one of my predecessors in the presidency have dealt with this subject; and I regret to say that the difficulties which they pointed out are still unremoved.

First and foremost comes the unsettled question of the building by-laws and the dilatory action of the Corporation. It will be remembered that, in the March of last year, a joint meeting of our Society and the Manchester and Salford Sanitary Association, was held in the Memorial Hall, to discuss the subject, and to urge once more upon the City Council the pressing need for the immediate publication in one volume of the building regulations and by-laws under which the municipal authorities profess to act. Our ex-president, Mr. John Holden, read an able paper, in the course of which he showed that for more than twenty years our Society has been endeavouring, but so far ineffectually, to arouse the Corporation to a sense of its duty in this matter, and to the dangers and the injustice of the existing system. A memorial adopted by the joint meeting was presented to the April meeting of the City Council last year, and a sub-committee of the Highways Committee (to whom the memorial was referred) was subsequently appointed to prepare an amended code; and only last week completed its labours. The amended by-laws, we are informed, are now in the hands of the printers; and it was announced at the City Council on Wednesday, June 6, that before being issued they would be submitted to our Society, in order, to quote Mr. Alderman Heywood's words, "to insure something like accuracy in the description of the various parts of buildings." How far the revision is a satisfactory one remains to be seen. The municipal authorities have not availed themselves of our offer of co-operation and assistance during the process of revision, and it is therefore possible that the regulations as amended and codified may require something more than the mere rectification of technical terms. But it is a matter for congratulation to feel that we are approaching the close of a long, a tedious, and what ought to have been an unnecessary agitation; and the Society will doubtless take care that nothing on its part shall further delay the completion of the work.

Attention was called two years ago to two comparatively minor questions—overhead wires and signboards. There has been no diminution in the number of overhead wires, but on the contrary a considerable increase. They are dangerous objects, and they are inimical to art, destroying the effect of an important part of the architect's composition—the sky-line of the building.

Within the past month, a still worse outrage has been perpetrated by the erection of three stacks of tall chimney funnels on bases of red bricks, on the top of a block of stone buildings in a prominent part of the city. In this case we may be tolerably certain that the services of an architect have been dispensed with, and that the monstrous abortion is the work of some building contractor. The owner, therefore, is to blame, and possibly can only be brought to a sense of the enormity he has committed by the pressure of public opinion. But it may be well also to ask, whether the municipality ought not to have powers to prevent the destruction of the artistic aspects of the city.

I have already mentioned the warehouse reconstruction of the town, which has been in progress during the last forty or fifty years.

In planning and designing buildings for commercial purposes we are met, of course, with the difficulty of light, an abundance of which is, in most cases, absolutely essential. In few towns is the problem harder of solution, for, as a rule, our streets are narrow and confined, and our atmosphere is murky. The difficulty is to secure ample light, and at the same time obtain a reasonable amount of pier space in the ground floor

storey, in order that the superstructure may be supported by the piers, and not upon iron columns or standards with little more than a veneering of granite, apparently quite inadequate to sustain the superstructure. There are in our city buildings of recent date that are apparently unsupported, for as far as the evidence of the senses goes, there is nothing beneath the superstructure but huge sheets of plate glass, the iron columns which are really the means of support being set back within the glass line, and so disguised as to be indiscernible. We cannot altogether lay the blame upon the designers of such buildings, for we may be quite sure they would never have produced such glaring inconsistencies if they had not been tied down by the false ideas of owners and tenants. At the same time it is to be feared that a sacrifice to truth is in many instances too readily made; and there is no doubt that an architect, by exercising firmness and judicious reasoning with his client, may often minimise the evil to which I have referred.

Looking back some twelve years, we can most of us remember that the building trade of Manchester was in a state of extraordinary and probably unprecedented prosperity. A long period of depression has supervened, during which our profession has suffered seriously. But at the present moment, I am happy to say, there are symptoms of a revival. Two projects are on foot of momentous importance, which seem destined to alter materially the existing state of affairs. These are the construction of the Ship Canal from Manchester to the estuary of the Mersey at Eastham, and the amalgamation of Manchester and Salford, with the addition, possibly, of some of the large neighbouring townships. The construction of the Ship Canal is being prosecuted with extraordinary vigour, and with engineering and mechanical appliances greatly superior to any previously brought to bear upon the same character of work, so that the completion of the vast undertaking seems likely to be effected within a shorter period than the four years originally contemplated. In our immediate district the face of the tract of land between Regent Road Bridge and Trafford Park on the one hand, and between Stretford Road and the Race Course and Ordsall on the other, must necessarily undergo a transformation of which we have at present little conception; and in the wake of the maker of the canal and docks will inevitably and necessarily follow the architect and builder.

Concurrently with this undertaking, and also with the changes foreshadowed by the County Government Bill, a movement has been started under most influential and promising auspices, for the amalgamation of Manchester and Salford into one city or county. This proposed union, which has been advocated by a few for many years, has at length reached the domain of practical municipal politics; its need has become more manifest by the pressure of events and circumstances; and a final decision is likely to be arrived at before many months have elapsed, which will settle once for all the future well-being and the powers of development of this populous community.

I think our Society would do well to render all the assistance in its power to the furtherance of the proposed union; and there is doubtless much information of value in the possession of the members which would prove most serviceable to the Amalgamation Committee. It is desirable that, either by the report of a committee of the Society, or by the voluntary act of individual members, any such information should at once be placed at the disposal of the promoters of the movement. For example, I venture to think that few men know better than architects the striking differences in the value of sites on the Salford side of the river, as compared with the value of land and positions on the Manchester bank.

Apart from such considerations, however, the proposed amalgamation could not fail to confer far-reaching benefits. With one central municipal government, great public improvements could be effected which are impossible under the present dual system. The river Irwell, now little better than an open sewer, the effluvium from which I have no doubt has contributed in a great degree to the abnormally high death-rate of the two boroughs, could be taken in hand by the conjoint authority. Besides more efficient sanitary arrangements, the united boroughs would, I think, be enabled to effect an improvement in which we, as architects, would especially rejoice, viz., the covering of the river from the Victoria Railway Station to the new Bailey Bridge, or even beyond; the formation of a fine open space between the Cathedral and the Exchange Station, and the construction of a new and broad thoroughfare over the river from Victoria Bridge to New Bailey Street. The effect of this splendid improvement in enhancing the value of property on the Salford side can scarcely be over-estimated.

Whether it be from prejudice, or sentiment, or the force of association, it is impossible to say, but it remains a remarkable and undoubted fact, that the commerce which is represented by the great shipping and merchants' warehouses of Manchester, will not move across the river, notwithstanding its proximity to the Exchange, but prefers to seek a much more distant part of the city. I am convinced in my own mind that it is solely in consequence of its severance from Manchester by the river, and

having no convenience of access save by the bridges, that Salford remains a borough of comparatively little importance, and dependent for its existence almost entirely upon Manchester. The city would gain in prestige by the union, but I think Salford would in every way derive the greatest benefit, and several great improvements that are now frustrated by the existence of two municipal governments for what is virtually one community, could be accomplished by the amalgamation, and can never be attained without.

Turning to matters more strictly affecting our profession, I think we have reason to congratulate ourselves that the re-arrangement on a broader basis of the Royal Institute of British Architects has at length been completed, and will shortly come into operation. The subject has engrossed the attention of our Society for the last five years, and, in my opinion, it has never assisted in the solution of a more important question. All of us, I presume, whether we are members of the Institute or not, have come to regard it as the central authority of the profession; and in any case, a Society which numbers something like thirteen hundred members, eight hundred of whom are in independent practice, must necessarily exercise a great if not a dominating influence. It is, therefore, of the utmost importance that it should adapt its constitution to the changed circumstances of the times, and by giving a hearing and weight to the views and interests of those members who practise at a distance from London, become thoroughly representative of the whole of the profession in town and country. Such was the view taken by the Manchester and other provincial societies. The representations made to the council of the Institute were met in the most courteous manner, full consideration and discussion followed, and the result has been the obtaining of a supplemental charter, dated March 28, 1887, containing largely-extended powers and a code of by-laws for the management of the Institute, under which every member throughout the country has a full share and interest in deciding all matters affecting the profession to which he belongs.

One of the proposals which is now being dealt with under the new charter and by-laws is the federation of the provincial societies (as societies) with the Institute, by which means the rules and regulations and schedule of professional practice throughout the country will be co-ordinated and made uniform; and while the provincial societies which ally themselves to the Institute will retain their independence, they will have a positive interest in the Institute, as the presidents of the most important ones (if Fellows of the Institute) will ex-officio have a seat on the council of that body. All members of the federated societies, if members of the Institute, will be entitled to a deduction from their subscription equal to 25 per cent., which, in the case of Fellows, will be equivalent to the amount of their subscription to this Society. Again, all members of the federated societies will have access to the rooms and library of the Institute, of course under certain restrictions. These are important concessions, made, I consider, in the most liberal and friendly spirit by the Institute, and which should and I hope will result in a large increase in the number of members, not only of the Institute, but also of the provincial societies. Many architects, amongst them my partner and myself, did not under the old arrangements feel justified in joining the Institute. Our objections are now removed; we have both become Fellows, and I understand that many others who held the same views have also decided to join. Personally, I may say that I consider it is the duty now of all properly qualified architects to connect themselves with the Institute, as the profession generally will thereby gain very much in the estimation of the public.

As you are aware, Manchester, through this Society, has from the outset been prominently connected with this movement. It already includes within its boundaries a larger number of members of the Institute than any other city or town in the country (London, of course, excepted), and I appeal to you to see that this position is not vacated or even jeopardised.

The examinations in architecture by the Institute, which qualify for admission as Associates, are of the greatest importance, and all students should consider the passing of such as imperative. Two of these examinations have already been held in Manchester, under the conduct of this Society, and others, no doubt, will follow in due course.

These examinations, and the membership of the Institute or of the allied societies, really render superfluous the registration about which we have heard so much lately. The Bill entitled the Architects, Engineers, and Surveyors Registration Bill, recently presented to the House of Commons, and withdrawn, would, I feel satisfied, had it been passed, have done much mischief. The Bill, it may be stated, proposed to delegate to a general council, composed of twenty-six persons (of whom only fourteen, under the provisions of the Bill, need necessarily be architects, engineers, or surveyors), functions which are now performed respectively by the Royal Institute of British Architects, the Institution of Civil Engineers, and

the Surveyors' Institution. It professed to be promoted on the ground of the expediency of enabling persons who have occasion for the services of architects, civil engineers, or surveyors, to distinguish between those who are qualified and those who are not qualified to practise as such. The attempted legislation was absolutely unnecessary; it showed a complete ignorance of the safeguards that already exist, and its operation could only have been mischievous. So far as our profession is concerned, any compulsory examination held for the purpose of granting the right to practise only, must of necessity have been of a much lower character than the Institute examination; and it should be borne in mind that a person who had managed to pull through so as to be placed on the register would, in the eyes of the general public, have been exactly on a level with the most accomplished architect. Altogether the Bill was full of inconsistencies, and I am glad to be able to say that this Society gave its hearty support to the opposition, which was headed by the chartered societies of all the three professions with which the Bill proposed to deal.

The address to architectural students which is shortly to be issued will, I hope, be found of much value to them. No efforts have been spared to make it as complete as possible. In it the experience of the older members of the profession has been freely placed at the disposal of those who are preparing to succeed us, and if it is found to be of service in assisting them in their studies, I am sure that those who have devoted much time and labour to its compilation will feel themselves amply rewarded.

There are other subjects which invite comment—such as the proposed institute of art and industry, in which, as at present contemplated, the school of art and the technical school are to be merged, and in whose scheme architectural teaching and training will no doubt have a place—but I have already trespassed sufficiently upon your patience. There is clearly an awakening of public spirit in our midst. The great enterprises now on foot or in process of inception cannot fail to bring a considerable measure of prosperity to our profession; and I feel assured that the work entrusted to its members will be accomplished in a manner that will add to their reputation, and be worthy of the best traditions of our art.

### BUILDING IN ROME.

THE British Consul has presented the following report to the Foreign Office on the extension of Rome and the building crisis:—

The year 1887 marked a period of serious trial in the economical and building progress of the capital of Italy, and it may not be void of interest to relate the most prominent facts connected with this crisis, especially now that its effects, though not all manifest, can to a certain degree be measured.

It has been justly remarked that in the house-building speculation, which at present constitutes the most relevant factor of commercial activity in Rome, the capital and exertions of seven different classes of people concur: (a) the owners of building ground, who in the majority of cases have concentrated in their hands vast lots of ground, which they subdivide and resell freehold, exclusively for building purposes; (b) the builders, who are generally the purchasers of that ground, paying down only a small sum, and undertaking to pay the rest by instalments; (c) the lenders of money to builders; these lenders are very often the owners of the ground themselves, who guarantee their credit on the value of the property, including the building in course of construction; the money is lent in the shape of promissory notes; (d) the workmen; (e) the firms who supply various building materials, fixtures, &c., principally on credit; (f) the lenders of current cash to builders likewise in the shape of bills; and finally (g) the Institutes of *Credito Fondiario* (Mortgage Banks) that intervene when the building is finished, and grant loans on mortgage up to an amount equal to half the estimated value of the property.

The cause that determined the crisis I allude to was a sudden stagnation of credit throughout Italy during the second half-year of 1887, which was attributed to various circumstances, foremost the excess of credit granted up to then; but the main origin of the crisis, as regards house-building in Rome, is to be attributed to the want of capital and lack of business capacity on the part of the builders. These belonged, or rather sprang up, from the most different, and some from the most humble, classes of society, allured by the facilities afforded to the building speculation, and by the encouraging results which had been obtained by builders during the first years of the building activity. It should be noted that building ground was then sold at reasonable prices, and a house when finished used to cost, including the area on which it was built, 55 or 60 per cent. of its estimated value, reckoned according to the average of rents. It was very easy under these circumstances for builders to sell at 70 or 80 per cent. of the said estimated value, and the result was a profit on the builder's side of between 10 to 15 per cent. As the cost of building ground

increased, and the main conditions of the enterprise underwent a notable change, the cost of a house rose to 80 and 90 per cent. of its value taken on the basis of the rents. Whilst the would-be profits of the builders were thus considerably straitened, the selling of houses to real investors became also difficult, unless builders would give up every profit for themselves and sell probably at a loss. An exorbitant quantity of bills deluged the market in the latter part of 1887, while the discounting of bills abroad was hindered on account of the high rise of the exchange against Italy, which reached 170 per cent. The fears entertained by foreign bankers as to the state of the building trade in Rome, as well as the limitation of discounts by the local banks, joined to the panic which seized the firms supplying the building materials, brought difficulties to a climax, and the crisis in a short time reached an acute stage. The artificial element of the speculation, or of sheer gambling by would-be millionaires, came thus to the ground. Foremost among the sufferers from the effects of this crisis are the builders, the suppliers of building materials, and the current cash-lenders, for all whom the property constituted no security. As for the other classes afore-mentioned, the crisis, it appears, is only a temporary hitch. In order to meet the requirements of the situation the banks and firms interested in the matter have already taken steps for getting in fresh capital.

The sudden check in the sale of building ground will be, however, severely felt by the said banks and firms. In order to give an instance of this, I may mention that one bank alone, at the end of 1887, had on hand 192,236 square metres of building ground, nominally disposed of, but the transfer of which had not been actually carried out by the fault of the purchasing parties.

The class of builders is very numerous. One of the banks that is entirely dedicated to the building speculation counts amongst its clients no less than 350 builders. One builder, perhaps the foremost amongst the rest, became a bankrupt, with liabilities amounting to 50,000,000 francs (2,000,000*l.*), partly covered by the assets, represented by ground and buildings in course of construction.

It is doubtful whether this state of things may properly be called "over-building," especially if one considers that with the slackening of the construction of new buildings house-rents became still higher. This shows that the extension of the town answers to a real want of the population. It is to be observed that very few of the houses in course of construction are left unfinished. The construction of houses is now conducted with less feverish alacrity, and no important new blocks of buildings have lately been undertaken; still the work already begun proceeds regularly, and the greater part of the buildings in course of construction are brought to completion.

Intimately connected with all this is the constant increase of the population of Rome, which may be reckoned on an average to be 18,000 to 20,000 souls every year, as well as the demolition of houses both by Government and municipality, which compels thousands of citizens to shift to the new quarters. It thus happens that the banks that are mostly interested in the building speculation earnestly hope to be able to overcome, with no serious pecuniary losses, the present crisis, much more so that credit was by them granted on the security of property, not of persons; and no considerable fall in the value of the ground, nor of houses, has taken place.

In the month of November 1887, several lots of ground situated in that part of the town known as "Prati," close to Castel S. Angelo, were sold by auction, and the price they fetched was:—

	Price.	
	Currency.	Sterling.
	Lire.	£
Per 19,011 square metres .	1,838,000	73,520
" 17,701 " .	2,015,000	80,600
" 10,446 " .	1,765,750	70,630
" 11,102 " .	1,992,750	79,710
" 58,260 " .	7,611,500	304,460

The average for each metre is 130.60 lire (5*l.* 4*s.* 6*d.*).

In May 1888 the expropriation of a large palace (3,130 metres of surface) situated in the centre of Rome, on the Piazza Colonna, was valued at 735 lire (29*l.* 8*s.*) per square metre, and the vendor accepted the condition of taking back a portion of the area, if so desired by the municipality, at a minimum price of 750 lire (30*l.*) per square metre.

Brickmaking, in which large capitals are invested, is one of the most compromised in the building crisis, not only on account of the check which the manufacture of bricks, that was already surpassing the limits of demand, is going to sustain, but also for the serious losses deriving from unsatisfied credits granted to builders.

I find in a report published by the local Chamber of Commerce that in 1886 there existed fifty brickyards in activity, forty of which were provided with furnaces, Hoffmann's system, and the other ten following different methods of manufacture. The total brick production might have reached 280,000,000 bricks in 1887. No less than 10,000 workmen and 800 carmen found employment in this branch of the building industry. Thus, calculating that bricks represent less than 40 per cent. of the materials used in buildings, the rest being tufa, cement, mortar, &c., the quantity of bricks above alluded to would be proportionate to 2,500,000 cubic metres of masonry to be constructed every year.

The following are the various building materials introduced in Rome during the years 1881-86:—

Years.	Cement, Tufa, Flint.	Lime and Chalk.	Bricks, &c.	Various Stones.
	Cub. Mètres.	Tons.	Number	Cub. Mètres.
1881 . .	275,000	39,800	52,000,000	4,225
1882 . .	319,000	41,400	61,000,000	6,100
1883 . .	348,000	52,100	78,000,000	4,990
1884 . .	498,000	68,500	88,300,000	6,186
1885 . .	769,000	94,000	118,000,000	9,247
1886 . .	1,035,000	123,000	144,000,000	12,554

The total value of above materials may be calculated for the year 1886 at 16,000,000 lire (640,000*l.*), of which 4,000,000 represent the value of cement, tufa, and flint, 7,000,000 that of bricks, 3,000,000 that of lime and chalk, and 2,000,000 other stones. In the latter are not included the stones, such as marble, granite, &c., that are brought from other mining districts.

### THE LONDON SCHOOL BOARD.

THE committee of the London School Board, consisting of the whole Board, appointed to investigate any allegations of corruption, met on Tuesday, the Rev. J. R. Diggle, chairman.

In response to the inquiry directed to all members of the Board, whether they had information of any charge or fact of bribery, collusion, or other corrupt practice affecting any member or officer of the Board, twenty-four replies had been received, and were read. These stated in effect that they had no information on the subject. The chairman submitted a letter received from Mr. John Walsh, of Leominster, dated June 20, 1888, as follows:—"Now that the Metropolitan servants are being found out, how about the School Board? I know your servants. Some of them get builders to newly build their houses, and for passing their (builders') accounts only. I know some of the builders in jobbing department charge for more lead, more wood, more solder, in three months than they have used in two lustrums. If you searched their books you would be amazed. I remember being asked to make up one quarter's account for a firm a few years ago. The prime cost was about 2*col.*; the amount against the Board nearly 8*ool.* *Multum in parvo.*"

It was stated that the chairman wrote to Mr. Walsh on June 23 asking for names and dates, and had received no reply.

Mr. W. Bousfield stated that had he possessed any such information he should have communicated it to the Board. From the position which he held as Chairman of the Works Committee and of the Special Committee of Inquiry into the Works Department, he believed that if corruption had existed among the officers of the Board it would have been brought to his notice during the careful inquiries which had recently taken place. There had undoubtedly been scamped work in the erection of some of the schools, and this must have been known to the clerks of the works employed by the Board to supervise the building. None of the officers now in the employ of the Board were responsible for cases of dishonest building. He believed the Board were fortunate in being served by a staff of honest, able, and hard-working officers, and that the general high tone which ran through the office under Mr. Croard's leadership made a spirit of corruption impossible.

Professor Gladstone said he had no such knowledge. During the fourteen years, however, that he had been connected with the Works Committee it had come under his notice that attempts had been made to influence officers of the Board, but, as far as he knew, without effect.

Mr. Helby stated that he had not made any such charges or allegations as those attributed to him by certain members of the Board, and having already made a personal explanation to the Board, he had nothing further to add. With regard to any information he might have in his possession, having in view the abortive inquiry of the Metropolitan Board of Works, conducted by a committee of its own members, and the painfully successful result of the inquiry conducted by the Royal

Commission, he did not purpose making any statement except before a Royal Commission.

The committees of the Board wrote that they had no knowledge of bribery, collusion, or other corrupt practice.

The replies from the public were then read.

Mr. Hindley, of 290 to 294 Oxford Street, W., wrote that briefly his case was this. Being invited to tender for some work, he heard, while preparing the estimate, that it was all arranged that another firm was to have the work. He informed one of the responsible School Board officials of this before the estimates were sent in, and was assured that there would be fair play, but he was surprised to find that what he had stated was actually carried out, though not by quite the same means as he had expected; and although his estimate was settled upon by the committee another estimate was afterwards produced and accepted by the Board. That estimate was the one from the particular firm which he had heard it was arranged should have the work, and who did not manufacture their own work. The treatment he received from one of the School Board officials when endeavouring to inquire into the matter confirmed the opinion he had already formed as to the method in which the work of the Board was done. Mr. Hindley added that he saw a good deal of time was likely to be wasted and trouble given to those who volunteered evidence, and therefore he had decided to let the matter stand where it was, but he should be prepared to come forward to give evidence when the whole subject was before a Royal Commission. In a second letter Mr. Hindley stated that his tender was the lowest, but that after it was accepted another tender was "discovered" which was lower; and that when he called at the offices for an explanation he was kept waiting two hours, and then refused all information, being referred to "the person who gave him the rest of the information."

Messrs. Cox & Wooland, Benham Grove, Thornton Heath, drew attention to the tenders for the Holydale Road School at Nunhead, asking why their tender of 109*l.* was passed, and another of 135*l.* accepted, when in almost every other case the lowest tender was accepted. The letter added, "perhaps, had ours been a big firm, with a little influence behind us, we might have been in the know a little earlier." Mr. F. Morgan, of 138 Bermondsey Street, S.E., stated that his mother had sold four freehold houses to the Board in 1885, and 5 per cent. was allowed till the time of settlement. He asked if that was the correct amount the Board was charged with, as it seemed a small sum, and deprived the widow of half her income.

Mr. R. Broad, of Sunderland, wrote that the Board had advertised for a clerk of works at 6*l.* a week, and though he had offered his services at 3*l.* a week he was rejected. As a builder of many years' standing he could have given useful information as to foundations of certain schools, which would have saved the Board many thousands of pounds, and he added, "I write this to show how easy it is to make a mistake in your choice."

Mr. J. M. Smith, of the Borough, wrote that he could furnish the "Commission" with the particulars of the proceedings of an officer of the Board, who invariably received three payments upon the large amounts included in the estimates as provisional sums. This was accomplished as follows:—His commission included a percentage of provisional amounts, and was paid from the first instalments received by the contractor. When adjusting the accounts a deduction was made of all the provisions, and 2½ per cent. was claimed upon the deductions. Another charge was made upon the net amount expended out of the provisions. A statement should be called for from the various builders to show the amounts paid to the surveyors for squaring up schools. It would be found that the official in question generally managed to get 50 per cent. more than other similar officers. The largest school fell to this gentleman, probably owing to his intimacy with another official. The letter concluded by expressing the hope that full inquiries would be made, which might unearth more mysteries, especially if a cheque book were called for.

The Chairman said the business now before the committee was the action they should take in reference to the communications received.

Mr. Gover thought it was very unsatisfactory that out of fifty-five members only twenty-three should have replied, and he moved that the rest of the members be requested to answer.

The motion was not seconded, and fell to the ground.

Colonel Hughes, M.P., remarked that the only thing for the committee to do was to say that there was no declaration of fraud of sufficient importance for the committee to take action upon. The matters brought before the committee in reference to the advertisements appeared to be very insignificant, for it might naturally be supposed that with a Board like theirs, spending 8,000,000*l.* or 9,000,000*l.*, there would be somebody upon whose toes they had trodden. No doubt there were matters, and always would be, in which a Board like that made mistakes, but all these matters of administration had been dealt with by the committees concerned. There appeared to be no charge against the Board, and as it was not for the com-

mittee to prove a negative, he should move that the various complaints received be reported to the Board, with the recommendation that they be referred to the various committees concerned; that the action taken by the committee be reported; that the Works Committee be instructed to forward the return as to what persons had sold more than one property to the Board, direct to the Board, and that the reference to the committee be discharged.

Mr. Barnes seconded the motion.

The motion was agreed to, Mr. Gover recording his dissent.

### ART CONGRESS AT LIVERPOOL.

A MEETING of the General Committee to arrange for this Congress took place on Monday in the Town Hall, under the presidency of Mr. P. H. Rathbone. A report was presented by Mr. H. E. Rensburg, the local hon. secretary. It stated that Sir Frederick Leighton, P.R.A., had given his support to the scheme, and had promised to become the president of the Congress, which is to be divided into six sections, namely, painting, sculpture, architecture, applied art, art history and museums, and national and municipal encouragement of art. The sittings of the Congress, it is proposed, shall extend over five days, and it had been arranged that the meetings should commence on Monday, December 3, in St. George's Hall. Owing, however, to the uncertainty as to the date of the autumn assizes, this arrangement may have to undergo an alteration, and the Congress may probably open a fortnight earlier. A programme of the week's engagements has been provisionally drawn up. On the Monday—the first day—Sir Frederick Leighton, Bart., will deliver his presidential address, and on the following days meetings will be held, morning and afternoon, of the various sections. On Tuesday Mr. G. Aitchison, A.R.A., president of the Section of Architecture, is to deliver an address in the morning, and there is to be an address in the afternoon by Mr. L. Alma Tadema, R.A., president of the Section of Painting. On Wednesday addresses are to be given by Mr. Walter Crane, president of the Section of Applied Art, and by Mr. Alfred Gilbert, A.R.A., president of the Section of Sculpture. On Thursday an address by Mr. Sidney Colvin, president of the Section of Art, History and Museums; and on Friday the Right Hon. A. J. Mundella, M.P., will deliver an address as president of the Section of National and Municipal Encouragement of Art. In addition arrangements are being made for combined meetings of certain of the sections. The report of the secretary was adopted, and on the motion of Professor Conway, seconded by Mr. F. J. Leslie (an additional hon. secretary), a finance sub-committee was appointed. Professor Conway stated that a sum of 1,000*l.* would be required for the Congress. The city of Liverpool had been pledged in a very prominent way before the whole nation in respect of the Congress, and leading men in all the branches of art had been invited to come down. It was therefore essential that they should exert themselves to get sufficient money to carry out their pledges. Local secretaries for the various sections were afterwards appointed. The Chairman said that during the last few years Liverpool had not taken that place among the great towns which she ought to do, and if she was to maintain the position of second city of the empire it was of great and serious importance that the forthcoming Congress should be made a real success. Another meeting of the committee will be held at an early date.

### TESSERÆ.

#### Works of Art in Schools.

J. RUSKIN.

THE first and most important kind of public buildings which we are always sure to want are schools, and I would ask you to consider very carefully whether we may not wisely introduce some great changes in the way of school decoration. There certainly comes a period in the life of a well-educated youth, in which one of the principal elements of his education is, or ought to be, to give him refinement of habits, and not only to teach him the strong exercises of which his frame is capable, but also to increase his bodily sensibility and refinement, and show him such small matters as the way of handling things properly, and treating them considerately. Not only so, but I believe the notion of fixing the attention by keeping the room empty is a wholly mistaken one. I think it is just in the emptiest room that the mind wanders most, for it gets restless like a bird for want of a perch, and casts about for any possible means of getting out and away. And even if it be fixed, by an effort, on the business in hand, that business becomes itself repulsive more than it need be by the vileness of its association, and many a study appears dull and painful to a boy, when it is pursued on a blotted deal desk, under a wall with nothing on it

but scratches and pegs, which would have been pursued pleasantly enough in a curtained corner of his father's library, or at the lattice window of his cottage. Nay, my own belief is that the best study of all is the most beautiful, and that a quiet glade of forest, or the nook of a lake shore, are worth all the schoolrooms in Christendom, when once you are past the multiplication table; but be that as it may, there is no question at all but that a time ought to come in the life of a well-trained youth when he can sit at a writing-table without wanting to throw the inkstand at his neighbour, and when also he will feel more capable of certain efforts of mind with beautiful and refined forms about him than with ugly ones.

### The Velarium of the Coliseum.

E. CRESY.

Lampridius (in *Com. a Militibus, Classiariis*) informs us that the management of the vela was left entirely to sailors, as they were more expert in going aloft amidst ropes, and understood the tackle which regulated the spreading of it better than others. There can be no doubt that it required considerable dexterity on the part of the engineer to keep steady an awning containing 113,345 superficial feet, which would be required for the amphitheatre at Nîmes, and for the magnificent Coliseum nearly 250,000 superficial feet, or more than double; the weight of which, at only one pound per foot, comprising the ropes and tackle, would amount to 112 tons or thereabouts. So vast a weight, disposed and upheld by tension alone, creates our wonder and admiration. At the level of the attic storey are 120 projecting consoles, each having a circular hole about 10 inches in diameter corresponding with a circular mortice of the same size, and 6 inches in depth, made in the projection of the cornice of the second order. The upper opening of the hole in each console has externally a groove 2 inches in height, destined for an iron collar, to which was attached a tie, which secured it to the wall of the attic at the level of the top of the console. The holes which contained these have some portions of the iron run with lead remaining. The whole of each console received a round mast, which, passing through it, rested in a hole sunk in the cornice below, the iron collar preventing it from acting against the sides of the console and fracturing it. The masts alone would not be sufficient to support the weight of the vela, extending over an elliptical area, the axis of which, in one direction, was 436 feet, and in the other 331. To aid in the support, other posts were introduced through mortices about 10 inches in length, placed opposite each console, at the projecting part of the moulding which crowns the interior of the attic; on each side, 4 or 5 inches from the edge of the attic, are holes still containing the lead which secured the iron ties that held these latter posts in their places. Under the mortice holes are others, 8 inches square and 2 feet in depth, made in the upper step of the attic to receive the second posts. The two posts were afterwards securely braced. Over the centre of the arena was an oval covering, permanently fixed, which in the Coliseum was ornamented with an immense golden eagle. Round the edge of this oval covering was attached a large cable. One hundred and twenty pairs of cords, of equal length, stretched from the masts on the exterior to this cable, were worked by pulleys, thus forming as many compartments. Each pair of cords was furnished with rings, to which the covering was attached, so that it could be drawn backwards and forwards at pleasure. The whole of these were called the vela or velaria, and each single compartment velarium. The distance between the ropes on which the velarium ran was greater towards the attic than at the centre; consequently, to make the velarium run freely on its rings, it was necessary that it should be of an equal width throughout. When spread towards the attic it was stretched, whilst towards the centre it sagged, and formed, as it were, a fold. To prevent the sun passing through the opening thus made by the sagging, an internal hanging was attached around the fixed permanent oval.

### Sandstone as a Building Material.

J. CUMMING.

Sandstone in every case consists of larger or smaller particles of silica or flint, held together either by mere aggregation, by calcareous cement, or by oxide or carbonate of iron, and sometimes by silicious cement; the last-named are always the best and indestructible. The most homogeneous examples should be selected, and those free from iron. Sandstones, however, do not generally commend themselves for enduring qualities; but occasionally examples have been employed that have stood the test of centuries and remained uninjured. At the time when the Houses of Parliament were about to be erected, a committee was appointed to decide upon the most useful and lasting stone to build them with, and the prominent buildings of this country were examined as to their state of preservation and the length of time which had elapsed since their erection. Of the eleventh century, Chepstow Castle, partly built of old red sandstone, is decomposed; Durham Castle the same; Fountains Abbey and Kirkstall Abbey, both

much decomposed; and the only eleventh-century work mentioned as being built of sandstone, which is still sound, is Richmond Castle, even the mouldings and carvings of which are said to be in a perfect state. The examination was conducted through the prominent buildings of the twelfth, thirteenth, fourteenth, fifteenth, and sixteenth centuries, and the result was not sufficiently satisfactory to induce the committee to recommend sandstone for its durability. The sandstones used at the present time are better than those formerly employed. The Craigleith sandstone, from the carboniferous formation in the vicinity of Edinburgh, is the most satisfactory, as it contains 98 per cent. of silica, and only about 1 per cent. of carbonate of lime. The sandstones from the millstone grit of Yorkshire are good, and where used have lasted for centuries. A very hard and lasting stone (if well selected and used in dry places) is the freestone from the greensand rocks. In the neighbourhood of Godstone and Nutfield many buildings are constructed of it, and appear to last well. The same quarry, however, often yields various qualities of stone. Patteson Court, Nutfield, is built of this stone from a quarry on the property. The older portion of the house is in perfect condition: the more recent, although built of stone from the same quarry, is flaking off and crumbling away rapidly. The sandstones from the Wealden formation, notwithstanding some of them appear very hard, soon crumble to pieces, and should on no account be used for any building intended to last. This stone has little or no cementing material in it, unless (as in some cases) carbonate of iron, which would be better absent. Sandstone may sometimes be employed in situations where moisture is the rule, when in exposed places it would be liable to destruction by the atmosphere. In selecting sandstone for building, and, indeed, any stone, it is well to observe in any adjacent quarry how the undisturbed surfaces have behaved themselves on exposure to the weather. Experience must of course decide, for many sandstones that are soft in the quarry (when newly cut) become hard and very good afterwards.

#### English Wall-Papers in the Eighteenth Century.

J. G. CRACE.

Recurring to the subject as connected with this country, in the year 1754 a Mr. Jackson, a manufacturer of paperhangings at Battersea, published a work on the invention of printing in chiaro-oscuro, and the application of it to the making of paperhangings, illustrated with prints in proper colours. This book is a sort of advertisement of the kinds of papers made, and the mode of manufacture employed by him. He adopted a style of paperhangings executed with blocks in chiaro-oscuro, in imitation of the most celebrated classic subjects. To use his words, "The person who cannot purchase the statues themselves may have these prints in their places, and thus effectually show his taste. 'Tis the choice and not the price which discovers the true taste of the possessor; and thus the Apollo Belvedere, the Medicean Venus, or the Dying Gladiator may be disposed of in niches, or surrounded with a mosaic work in imitation of frames, or with festoons and garlands of flowers, with great taste and elegance; or, if preferred, landscapes after the most famous masters may be introduced into the paper. That it need not be mentioned to any person of taste how much this way of finishing with colours, softening into one another with harmony and repose, exceeds every other kind of paperhanging hitherto known, though it has none of the gay, glaring colours in patches of red, green, yellow, and blue, &c., which are to pass for flowers and other objects in the common papers." By the account of this gentleman we find that paperhangings were then in common use, and had reached a certain degree of perfection, for that even arabesques were executed; and I therefore conceive that the art discovered by Lanyer had been continued from his time to the present; particularly as in the year 1712, the tenth of Queen Anne, a duty of 1½d. per square yard is imposed on this manufacture. In the reign of that queen, the Chinese paperhangings were very much employed, and have continued in fashion to the present day. These hangings, though parts of them may be executed by blocks or stencils, are almost wholly painted by hand. Contemporary with Jackson, I have learned that a Mr. Taylor, the grandfather of one of our present most eminent manufacturers, carried on this business to a considerable extent, and accumulated a large fortune. He was succeeded by his son, who, I am informed visited France, and was enabled to give the manufacturers there considerable information. He said, on his return, that he found the French paperhangings very inferior to our own, both as to execution and beauty of design. In those days we had an extensive export trade in this material to America and other foreign parts, but we are now driven out of the market by the French. The paperhangings at that date, about 1770, were manufactured nearly in the same manner as at present. I have, indeed, seen a flock paper of a large rich damask pattern, more than one hundred years old, which resembles in every way the modern material; it is singular that this art of flocking was disused and almost lost during a

period of twenty years, and revived only about forty years ago; a mode of decorating papers was also formerly employed, which is now never adopted. I have seen papers ornamented with a substance commonly called frost, a species of talc. In the year 1786 there was established at Chelsea a manufactory for paperhangings of a superior description, conducted by Messrs. George and Frederick Echardts, gentlemen of considerable taste and spirit. The mode of manufacture was different to that in general use, for, besides the usual printing blocks, copper-plates, on which were engraved designs of great finish and beauty, were likewise employed, and they not only printed on paper, but also on silk and linen; and by an under-ground of silver or gold, they obtained very beautiful effects of colour. Only part of the design was given by printing; it was finished by artists constantly retained by the manufacturers, men of considerable talent, who, again, were assisted in the inferior parts by young girls of whom more than fifty were employed. And had this undertaking been supported by the Government, it would, I do think, have been more available as a school for our rising artists, and of infinitely greater service than our present school of design, for it would have been a working school, and no other, I am convinced, will be of any use in forming a talented race of decorative artists in this country. There was also about this time another establishment similar to the former, conducted by Mr. Sheringham, in Marlborough Street.

#### Ancient Use of Bronze.

C. DALY.

In reading the travels of Pausanias in Greece, we cannot but feel surprised at the immense number of bronze works in sculpture which he meets with at every step, particularly when we recollect that the country had been in the possession of the Romans for three centuries, and that they had already, on several occasions, carried away thousands of bronze figures. Of thirty-three colossi described by the tourist, thirty were of bronze, the three others of wood; he also describes thirty-two equestrian statues of bronze and twenty-four chariots, at least of natural size, sometimes with two, and oftener with four horses, and holding one or two figures. Some were accompanied by runners or grouped with men on foot who led them; in fine, he mentions more than forty animals of considerable size, also of bronze. And yet Pausanias only visited a part of Greece. It was of bronze that the Athenians, after the death of Pisistratus, formed the first quadriga, in memory of their fellow countrymen who died while fighting for their native land. The Romans made frequent use of bronze, and like the Greeks, employed it in the form of candelabra, lamps, furniture, triclina, altars, tripods, tools, fastenings, letters for monumental inscriptions, window fastenings, &c. The doors were sometimes plated with bronze, secured with nails of the same metal; such as those of the Pantheon. Pliny (B. 34, sec. 7) says that the ancients were accustomed to make the threshold and gates of temples of bronze. Ancient gates entirely formed of bronze are still to be seen in the church of St. Cosmo and St. Damian in the Forum at Rome, formerly the temple of Romulus and Remus, and this luxury was not exclusively confined to temples, for, 380 years before our era, the ornaments were of bronze on the doors of the house of Camillus. By means of cramps large masses of bronzed ornaments and carvings were fastened on monuments by way of decoration. On bronze tablets were engraved laws, treaties of peace, and public acts intended to be made known to posterity. Three thousand of these tablets were destroyed in the fire of the Capitol, in the time of Vespasian. Capitals were also made of bronze, which were secured on cores of stone. Pliny relates that "C. Octavius, who conquered Perseus in a naval action, erected, in honour of his triumph, a double portico, which was called Corinthian, because the capitals of the columns were of bronze; this portico was near the Flaminian Circus; the capitals of the Pantheon, placed there by Agrippa, are of the same metal." The Romans further applied bronze in the execution of works on a large scale; the framing of the Pantheon was constructed of bronze, and, according to Serlio, who had examined it in its place, the different pieces were hollow; they were put together in the same way as woodwork. The caissons of the vault of this monument were also of bronze, and the circle which frames the opening by which the Rotunda is lighted still remains. In the baths of Caracalla the ceiling of the immense hall known as the Cella Solæaris was formed of a network of bronze; a fact of which M. Blouet did not seem to be aware when he published his restoration of that monument. The ancients also constructed roofing of bronze, for, 212 years before the Christian era, the temple of Vesta, at Rome, was covered with tiles of bronze, and so, at a later period, was the Pantheon. As to bronze statues, there was at Rome a number truly prodigious, brought from all the great cities of Etruria, Greece, Sicily and Asia Minor. Scæurus having erected a temporary theatre at Rome, towards the end of the Republic, decorated it with three thousand of these statues.

THE LAST PRAYER FOR THE CONDEMNED.

WHEN we published lately *The Kiss of Reconciliation*, by M. VAN DER OUDERAA, we remarked that the artist painted many pictures relating to the administration of the law in Belgium. The work we now reproduce is one of them.

It was the custom in Antwerp to have altars along the *via dolorosa* which criminals traversed on their way to execution. Prayers were said before the crucifix, in which the officers of justice and the populace joined. In the illustration it is supposed that the procession has reached the last altar, and as the woman can see the stake from the place where she kneels, she is too fascinated by the sight to take any part in the devotional service. A murderer would escape if he received a kiss from the representative of his victim, but for women who were supposed to be guilty there was no mercy. The law-makers were men, and the stake was made the penalty of crime that often was only imaginary. From such books as Fox's "Martyrs," it is plain that in England a woman was not spared any offering at the stake. Punishment was meted out to her by a judge, and both executioners and sheriff felt in duty bound to carry it out to the letter. But on the Continent there was consideration for feminine weakness: as the French judge said to the son of Madame DE SÉVIGNÉ, here were "certains petits adoucissements à cause de la faiblesse du sexe." Straw would be thrown over the woman's head in order to suffocate her, or a blow would be given in removing it which was likely to render her incapable to feel any pain afterwards. As Madame remarked when she heard the story, "To be burnt is not as terrible as one imagines."

In the picture we illustrate, as in the *Kiss of Reconciliation*, it will be seen that M. VAN DER OUDERAA introduces nothing which is suggestive of the stage. A student of the history of Antwerp and of its manners and customs, the past has to him the vividness of the present, and he can paint a historic scene as if he were one of the spectators, and had seen it from some coign of vantage.

ARCHITECTURAL ILLUSTRATION SOCIETY.  
SECOND SERIES.

NO. 9.—CHIMNEYPIECE, DAWPOOL, CHESHIRE. [R. NORMAN SHAW, R.A.]

HOUSES, SUNDRIDGE PARK AVENUE, BROMLEY.

THESE are built from the designs of Mr. CHARLES BELL, F.R.I.B.A., of 3 Salters' Hall Court, Cannon Street, for Mr. W. DEACON. They contain three well-proportioned reception-rooms, vestibule and inner hall, kitchen, offices, &c., on ground floor, and eight bedrooms, and occupy about an acre of land in the best part of the avenue.

## WOLVERHAMPTON SCHOOL OF ART.

AT the special meeting of the Wolverhampton Town Council on Tuesday, the Mayor (Alderman J. Jones) in the chair, a report was received from the General Purposes Committee recording the resignation of the following members of the Art Committee:—The chairman (Mr. S. T. Mander), Alderman Thorne, Councillors Manley and Marston, Colonel Loveridge, Messrs. F. J. Badger, T. Beach, P. Horsman, W. H. Ince, H. G. Powell, C. Wells, and R. Williams; and subsequently of the Mayor, Sir Rupert Kettle, and the Rev. J. T. Jeffcock. The remaining members of the Art Committee are Alderman Bantock, Councillor Ironmonger, and Councillor Shepherd.—Alderman W. H. Jones moved the reappointment of the Art Committee, and the termination of the contract with the present headmaster. In support of his motion he quoted the recommendation of the late Art Committee, to the effect that no improvement in the position of the school would be effected until it was placed under a fresh headmaster. The late committee consisted of men representative of the manufacturing, the artisan, the educational, and the professional interests of the town—men who had given no less than 13,000% towards the funds of the institution.—Mr. Jenks, in seconding the resolution, said that the Council had to consider, not the prospects of Mr. Gunn, but the interests of the ratepayers. They had been

granted a penny rate for the promotion of art education in the borough.—Alderman Thorne moved a resolution asking the old Art Committee to continue in office; that one sub-committee, under the chairmanship of Alderman Bantock, should take the management of the School of Art; while a second sub-committee, presided over by Mr. Mander, should deal with the art gallery.—Alderman Bantock expressed approval of the compromise proposed, and seconded the amendment. He thought it necessary, however, that the contemplated School of Art sub-committee should consist of a larger number of persons than the minority of the Art Committee who sympathised with his action in the proposed dismissal of Mr. Gunn. Alderman Bantock, proceeding, accused the old Art Committee of issuing misleading statistics.—In answer to Mr. C. T. Mander, Alderman Thorne said that the chairman of the whole committee should be neither Alderman Bantock nor Mr. Mander, but some person who could hold the balance between the two opposing parties.—In reference to Alderman Bantock's suggestion, the Town Clerk said that the constitution of the Art Committee could only be altered by the election of fresh members to fill vacancies.—Mr. S. T. Mander, as the chairman of the old Art Committee, expressed his wish to entirely retire from the conduct of the School of Art and the Art Gallery after the personal abuse which had been directed against the committee, and the vote of the Council at its last meeting. The compromise suggested by Alderman Thorne was the less likely to succeed because of the difficulty which Alderman Bantock's conduct created in the way of a conciliatory treatment.—Mr. J. J. Tate inquired who had crossed out the names of the Art Committee from the circulars issued with reference to the coming exhibition to possessors of pictures desired for loan.—Alderman Major expressed his unwillingness to see the present system continued, and therefore objected to Alderman Thorne's proposal.—Mr. R. R. Rhodes supported the compromise.—Mr. Williams thought that the Art Committee had reported correctly, and said the present state of things was scandalous. Alderman Thorne's amendment settled nothing; Alderman Jones's resolution was tangible.—Mr. Bates complained that if any artwork modelling or chasing were required by a Wolverhampton manufacturer, it had to be done in London or Birmingham.—Mr. C. H. Cousins considered that as the committee were defeated they should have resigned. But Alderman Thorne had suggested a means by which the committee's connection with the art gallery would be maintained, while Mr. Gunn would continue his work in the School of Art.—Mr. C. R. Smith said that the compromise, like most compromises of the character, was unworkable.—In answer to Alderman Jones, Alderman Thorne said that one reason for his amendment was that if the proposed School of Art sub-committee were given sufficient rope they would hang themselves.—The amendment was then put, and carried by 25 votes to 11.—Mr. Mander said that the acceptance of the amendment by the committee would depend upon the general opinion of the other members.

## CRYSTAL PALACE SCHOLARSHIPS.

ON Saturday the award of scholarships in connection with the Crystal Palace Company's School of Art, Science, and Literature (Ladies) was completed. The scholarship in art was adjudged to Miss Berta Ohlenschlager, of Sydenham; the medal for painting in water-colours to Miss Kate Bennett, of Forest Hill. The judges were Mr. J. B. Burgess, A.R.A., Mr. C. B. Birch, A.R.A., and Mr. R. Beavis, R.W.S. Certificates were also awarded to students for painting in oils, drawing from the antique, and drawing from the life. The musical scholarship was gained by Miss Matilda Harris, of Norwood. The examiners were Professors J. F. Bridge, Mus. Doc., and Mr. C. J. Hargitt.

## MR. FRANK HOLL, R.A.

THE tidings of the death of Mr. Frank Holl, R.A., which took place on Tuesday morning at his house in Fitzjohn's Avenue, at the early age of forty-three, will cause widespread regret. Mr. Holl had been ailing for some weeks, but it was hoped that with care he would be able to pass through the crisis which had been brought on by over-exertion. This, however, proved unfortunately to be a vain hope, and the attack of Tuesday was rapidly fatal. The *Times* says it is undoubtedly the case that the very hard work of getting his pictures ready for the exhibitions at the end of last April developed his delicacy of the heart to a dangerous extent. He was, however, unconscious of this, though he had long known that any very great exertion would be perilous. When the pictures had been sent in he paid a hasty visit to Spain by way of taking a holiday; for, he said, "I am tired, and feel as if I had been getting into a groove; a few days with Velasquez will give me just the stimulus I want." He went to Madrid and was back again in

less than a fortnight, and the strain of this long and rapid journey proved too much for him. He had a seizure soon after his return, and Sir William Jenner forbade him to undertake more than one sitter a day. This moderate amount of work seemed not too great for his strength, but a fortnight ago, while staying with a friend, he had a second seizure, and since that time his doctors—Dr. Broadbent and Mr. William Adams—regarded his case as anxious, though they by no means despaired of curing him. But on Tuesday morning at half-past eight he was again seized with cardiac disease, and in a moment he was dead.

Frank Holl was a son of the late eminent engraver Francis Holl, A.R.A., and was born on July 4, 1845, at St. James's Terrace, Kentish Town. As a boy he went to University College School, but his inherited love for art soon asserted itself, and at fifteen he was entered as a probationer in the Royal Academy schools. There he soon made his mark, obtaining a silver medal in 1862 and the gold medal and a scholarship in the following year. In 1864 he began to exhibit, and from that time contributed regularly to the exhibitions. In 1868 he gained the Two Years' Travelling Studentship, and a little later he may be said to have decided upon the style of subject and treatment by which, for the next ten years, he was almost exclusively known. He devoted himself to subject pictures, generally of a pathetic and melancholy cast, such as are indicated by the titles *No Tidings from the Sea* (1871), *Leaving Home* (1873), *Deserted* (1874), *Want*, and *The Emigrant's Departure*. Pictures of this kind, treated with undeniable power and vigour, gained him his Associateship in 1878; but if he had not in a happy moment ventured into a different field of art he would not have taken a front rank among English painters. Nine or ten years ago, however, he determined to paint the portrait of his neighbour, the veteran engraver Samuel Cousins. The impression which that portrait made is still fresh in the recollection of many; good judges were at once arrested by the strength of handling, the grasp of character, and the Rembrandt-like power over light and shade which were so apparent in it. Strange to say, the one person who disliked it was Mr. Cousins himself, who, with a curious vanity from which old men frequently suffer, declared that the painter had added to his years, and had made him appear too old. So seriously did the octogenarian engraver regard the matter that it was long before he forgave Mr. Holl, little suspecting that the painter, to use a phrase of Mr. Gladstone's, had "immeasurably increased his chances of immortality." What the public thought of the picture was very soon apparent, for Mr. Holl was at once overwhelmed with commissions, so that from that time to the day of his death he may be said to have scarcely had a single day, except during his annual holiday, free from sitters. A list of them would include a very large number of the most eminent contemporary Englishmen, while not a few Americans took advantage of a visit to London to have their portraits painted by Mr. Holl. Indeed his very last work, and the only one which he completed since the opening of the present Academy Exhibition, was a portrait of Mr. Cornelius Vanderbilt. Among the most successful of his pictures—and they have numbered at least twenty during each of the last eight or nine years—we may mention portraits of Signor Piatti; Major Graham, the late Registrar-General; Captain Sim, a naval veteran of 90 years old; Dr. Cradock, the late principal of Brasenose; Dr. Bellamy, president of St. John's; Sir Henry Rawlinson, Sir Frederick Roberts, Vice-Chancellor Bacon, Lord Wolseley, Mr. Chamberlain, Lord Overstone, Mr. Bright, and the Duke of Cleveland—the last a particularly brilliant work which attracted very great attention in the Academy of 1886. The portraits of this year are too well known to be named; everyone will remember especially the picture of Lord Spencer, which will probably be reckoned by posterity as the painter's masterpiece, and the picture of Mr. Gladstone which was last week given to its subject as a golden wedding present. Besides these half-lengths, we may mention the two full-lengths of the Prince of Wales, painted for the Middle Temple and for the Trinity House, and that of the Duke of Cambridge in the uniform of a Field-Marshal. Of these the Middle Temple portrait of the Prince is especially successful, and among all the Royal portraits exhibited at Manchester last year it stood out conspicuous as the work of a man who was really a master of his art.

Mr. Holl, who was made an R.A. in 1884, did not live to realise two of the great objects of his ambition—to paint the portraits of some beautiful women, and to paint a great group of portraits in costume, such as the Bench of Judges. The truth is that he was always so overwhelmed with commissions from eminent and wealthy men that each of these projects kept being deferred from year to year. There can be no doubt that he would have succeeded magnificently in the second task, for no one of his English contemporaries could surpass him in the gifts of colour, composition, and character-painting. Whether he would have succeeded equally well with the face of a beautiful woman is more open to question; his almost over-masculine art might have found it difficult to adapt itself to

smooth texture and soft outline. But even this difficulty might very possibly have been triumphed over, for he had triumphed over many difficulties as great. It is interesting to note that his chief reason for taking to portraiture was disgust at the treatment which his subject pictures had received from the hands of the critics. They pronounced them sombre, monotonous, a little wanting in ideas, a little heavy in handling. The young Associate was indignant, and resolved to try a new line altogether; and this resolution of his, which has given us the long list of noble portraits which have done so much of late years to raise the English school, may surely be counted to the credit of the critics, as some compensation for the many sins which are laid to their charge. For Mr. Holl's portraits are undoubtedly among the great features of the recent history of English art. People call them mannered; but to what painter's work will not the term apply? They are sometimes charged with exaggeration, with undue emphasis; but it is more true to say that they are expressive to an extraordinary degree. There is a brilliancy of execution about them, especially about the best of them, to which few works of the English school can show a parallel. They were painted under the stress of excitement; the artist used to say that unless he put his whole force into a picture, unless he felt an emotion in painting it, he could not work at all. Sometimes he thought he was failing; and it is curious that this thought was painfully and strongly present to him when he was at work upon the greatest of all his successes, the portrait of Lord Spencer, which he called the most difficult task he ever undertook. It need not be said that every touch upon all his pictures was his own, which is more than can be said of the portraits of Rubens, of Vandyke, and of Sir Joshua.

Personally Mr. Holl was charming from the openness, simplicity, and geniality of his character. He was not a conversationalist, but he had a fund of cheerful talk for his sitters, and his many friends always found him glad to see them when he had a free hour from work, and always chatty and cordial. He was very popular among his colleagues at the Academy, and no man worked harder than he at the Academy schools. He thought well of the prospects of English art, and used to say, by way of illustrating the progress which the present generation has seen, that work which in his youth would have gained a medal would now hardly gain admission to the schools.

Mr. Holl's father died four years ago. His aged mother is living, and he leaves a widow and four daughters.

#### GLOUCESTER BATHS COMPETITION.

AT the quarterly meeting of the Gloucester Town Council the subject of the proposed baths was under consideration, a lengthy report of which appears in the *Gloucestershire Chronicle*.

The finance committee reported that on July 6 the Town Clerk laid before them the Local Government Board's sanction for the Corporation to borrow sums of 7,100*l.* and 1,400*l.* for the purpose of providing public baths, the former amount to be repaid within thirty years, and the latter amount within ten years, from the date of the borrowing thereof.

The Mayor read a letter from Councillor Platt, who said he had carefully studied the baths question since the last meeting and he believed that nothing less than the committee's recommendation would meet the requirements of the case. He would strongly urge, in the interests of the ratepayers, the Council to go to the expense of 7,500*l.*, or even beyond that, so as to have a creditable building.

The Town Clerk said Mr. Tom Cook, the architect who received the second premium for his plans, had written two letters addressed to the Mayor and Corporation. They were as follows:—

39 Victoria Buildings, Victoria Street, Manchester :  
July 9, 1888.

From the Gloucester newspapers I learn something of your difficult position in this matter, and I am prepared to help you as follows:—I am willing to take up my design, and in this form I guarantee to obtain a tender for the sum of 6,000*l.*, and to carry out the work in a substantial manner, giving you all the accommodation you are to get by the "re-cast plans," which have produced such unfortunate results. To show my bona fides in this matter, if I fail to produce the result above stated, or such as shall satisfy you, I will leave myself entirely in your hands to remunerate me or not for my services, reserving only that I am paid for any attendances upon you at Gloucester.

39 Victoria Buildings, Victoria Street, Manchester :  
July 23, 1888.

I herewith send plans showing how I propose the accommodation guaranteed by my letter of the 9th. Kindly note that I have slightly improved the arrangement of the entrances, waiting-rooms, and private baths. Your desire for a private entrance to the Turkish baths suggests to me the formation of "areas" between the front block and the swimming-baths, and through one of these the private entrance is made. This is arranged so as not to interfere with the

working of Turkish baths from Barton Street ticket-office when desired. I think a passage from Prince Street to Barton Street will be a useful and valuable means of communication between the two—will increase the value of the plot of land westerly of Prince Street, and in treating for the property now blocking the end of this street will be a good lever in your hands. The passage having gates at each end may be closed nightly. The first-class swimming bath is not in this plan so long as in my premiated design. I have taken advantage of this money saving to improve the front elevation to Barton Street. I send a drawing showing this. The front windows to the private baths would be glazed with opaque glass. The manager's desk, being in the form of a "cylinder fall writing-table," will allow of everything being closed up quickly. A flap in the space for dirty towels prevents a sight into second class swimming bath from the central lobby. I think the plan and elevation will now recommend themselves to you.

Mr. Peake moved:—"That this Council, having most carefully considered the question of the expenditure in connection with the proposed public baths, sees no present sufficient reason for exceeding the amount originally fixed on, namely, 6,000*l.*, as the cost of the buildings, with the necessary fittings and appliances, exclusive of architect's and surveyor's commission and salary of clerk of the works, and this Council hereby reappoints the members of the Baths Committee as named in minute 440, with the addition of Alderman Knowles, Councillors Murrell, Campbell, Clarke, and Norton, to consider and report upon the whole question, paying due regard to the first part of this resolution, and five of them to form a quorum." Mr. Peake said it might not be out of place if he gave a history of this much-vexed question. He remembered when he first came to Gloucester, sixteen years ago, that the desirability of baths was often discussed, and more particularly just before November 1. In 1885, before he had the honour of a seat there, the Council pledged itself to baths. He alluded to the sites difficulty which followed, and said the subject fell into more resolute and determined hands, and one of the first acts of Mr. Vassar-Smith during his mayoralty was to cut the Gordian knot, and the Charlton House site was decided on. He believed that at one time 4,000*l.* was looked upon as quite sufficient expenditure on baths, but he was certain that when the Council decided on 6,000*l.* everyone considered this a most extravagant sum. One of the most vital and positive instructions to the competing architects was to draw their plans to a scale of 6,000*l.* expenditure. Mr. Trew was awarded the first premium expressly on the ground that his plans would come within that amount. A number of most meritorious plans were rejected entirely because they could not be carried out for that sum, and he said that if the Council proposed to spend the sum recommended by the committee they would be acting most unfairly, unhandsomely, and dishonourably to these gentlemen. Let them see with what amount of weight and authority this recommendation of the committee to spend 7,500*l.* came. The committee consisted of the Mayor, Aldermen Taynton and King, Councillors Powell, Vassar-Smith, Platt, Seekings, and Bruton. They all considered this a very strong committee, and if that committee had been at all unanimous in their recommendation he was sure the Council would have felt themselves called upon to place most implicit confidence in it. But their report was most emphatically opposed by the Mayor and Alderman King. Then Mr. Powell told them that Mr. Trew's original plans would have given them everything that was required, but that the difficulty was brought about by the action of the practical men. He thought they might say that Mr. Powell was in opposition to the report. Then Alderman Taynton expressed his gratitude to Mr. Powell for having so effectually shown that the practical men were responsible, and went on to say that he was thankful he could not be considered a practical man. Then Mr. Vassar-Smith, in consequence of the enormous demands on his time, was only able to attend a limited number of meetings. Mr. Bruton stated it was the most unhappy day for him when he became a member of the committee, and that he had not had a peaceful moment since. Therefore they must feel that if he had this doubt and perplexity, Mr. Bruton could not be very robust in his support of the recommendation. Thus they were brought down to two gentlemen, Messrs. Platt and Seekings, for whom they had all possible respect, but at the same time he thought their recommendation was hardly sufficient for the Council to undertake such a big responsibility. Now Mr. Trew's original plans, which were marked 5,680*l.*, could either have been carried out for that sum or they could not have been. He was not wishing to say anything hostile or disparaging to Mr. Trew. If the plans could not be carried out, then it must seriously weaken the Council's confidence in Mr. Trew and Mr. Roger Smith. If the plans could have been carried out, then the alterations and additions which were recommended by the committee—he thought, practically, recommended by Messrs. Platt and Seekings—represented an amount of over 3,000*l.* When these two gentlemen recommended these alterations and additions they either knew they would cost such an amount as 3,000*l.* or they did not know. If they did not know it, then he could not help thinking they

were lamentably negligent or incredibly ignorant. If they knew, he thought their plain duty was to have come to the Council and have stated that as they found the plans did not give what was required they recommended certain alterations and additions, and that the work could not be carried out under 8,000*l.* or 9,000*l.*, and they should have asked the Council to allow them to spend that money. It might not be amiss to see by whom the recommendation of the committee was supported. Most prominent was Alderman Mott, who supported it in a speech of great length and eloquence, introducing several arguments which he (Mr. Peake) could not help thinking were very specious, although they sounded very attractive. Alderman Mott had told them that this question was a matter of business. Well, he presumed Alderman Mott would expect a business to pay. He did not think any gentleman believed that the baths could be by any possibility pay; therefore if Alderman Mott's argument were followed to its logical conclusion there would be no baths at all. Then Alderman Mott said the Council made a mistake altogether in deciding what amount they would spend before they decided what they really required. He (Mr. Peake) did not think the baths necessary, although he thought they were desirable, and therefore he considered the proper course, as the Council had wisely taken, was to decide first how much money they were prepared to spend for the gratification of a desire. Alderman Mott had said they should do everything they could to render the city attractive as a place of residence. There was a well-known saying that example was better than precept, and he would like to ask Alderman Mott whether, when these baths were erected in accordance with his ideas—with carpets, mirrors, and decorated walls—he would consider them sufficiently attractive to induce him to come and live in Gloucester? He could not help thinking that if Alderman Mott, who did a large business here and had many interests in the city, could not see his way to reside here, then his arguments would not have much weight with other people. At one meeting Mr. Mousell had referred to the plans marked "Experience," but somehow at the next meeting he appeared to have undergone a process of conversion with regard to them. Mr. Moffatt had supported the recommendation of the committee, and said the proposed baths were very cheap. In conclusion, he said he did not know how the Council stood with regard to Mr. Trew—whether they were absolutely wedded to him, because it might be considered necessary to have a divorce. Mr. Baker seconded the resolution.

Mr. Murrell said he was sorry he could not agree with the recommendation of the committee. He wanted to see baths constructed in a useful and economical manner. But let them construct them as they liked, they would not pay. His idea was to have had the baths constructed for 4,000*l.*, and he would not exceed 6,000*l.*

The Sheriff said he had thought it would be interesting for the Council to know what the other six cities which were counties in themselves were doing in regard to swimming-baths and he therefore wrote to the town clerks of those places, and they had supplied him with official information on the subject. At Canterbury the baths were the property of private owners and they at first paid a small dividend, but the receipts were now about equal to the expenditure; they were no attraction to the city. At Chester there was a floating-bath in the river Dee, it belonged to the Corporation, and appeared to be very successful, the receipts being 145*l.* and expenses 69*l.* At Exeter the Corporation had provided a bathing-place in the river, with dressing-boxes, and the place was undoubtedly much frequented and had been a great boon. There were no public baths at Lincoln. At Worcester there were swimming-baths in the river belonging to the Corporation, and also private ones. At York the Corporation had erected two public baths at a cost of about 9,000*l.*, but it could not be said that the baths were an attraction to the city; there was a deficiency of several hundreds per annum in their working, and this had to be paid out of the rates; the Corporation made a portion of the river available by covering it and making dressing-sheds, and these were free. The Sheriff said that, inasmuch as most people could have a bath in their own houses, he did not think public baths were necessary in Gloucester, although they might be desirable. He wished swimming-baths could be made in the river, but he was afraid the water was not good enough. To spend 9,000*l.* on public baths would, he thought, be the height of folly.

Mr. Seekings said the question of cost was one really involving dimensions. It was just because the committee thought it would be a mistake to curtail the dimensions of the baths that they made the recommendation they did. He did not think Mr. Peake's review was altogether fair. Mr. Peake had tried to show that the recommendation of the committee came before the Council with but small authority. He spoke of the recommendations as those of Messrs. Platt and Seekings—as those only of the practical men. He should like to ask Mr. Peake where he supposed Alderman King was, and whether it was possible for a miserable minority of two to bring the whole eight members round to their opinion? If the truth must be

told, he must say that no man was more persistent than Alderman King in keeping up the dimensions. He feared the effect of carrying out Mr. Peake's proposition would be to limit the dimensions of the baths. He confessed he would rather have baths at a reduced cost than go without any. Reference had been made to the plans of other competitors. He hoped the committee would be business-like, and not deal with them. If a competitor chose to write a letter, let it be read and then end there. It was unfair to the architect who had been appointed to entertain any such proposal as they had heard that morning. It was most extraordinary that the proposal which they had heard to form an area between the front block and large baths was only to be found in Mr. Trew's plans. Mr. Seekings concluded by moving as an amendment that the report of the Special Baths Committee be approved and adopted. Mr. Moffatt seconded.

Alderman King said he thought it a great pity that when one member of a committee was absent that other members should undo what had been done before. He stated that when he was absent Mr. Seekings and those present "skinned the thing" by cutting out a boiler, reducing the thickness of the walls from 14 to 9 inches, and reducing the height of the buildings. As soon as he (Alderman King) came back he objected to this, and then an informal meeting of the committee was called, but he declined to attend it. He made inquiries and found that the town clerk knew nothing of the meeting, and that he was simply summoned by a boy from the surveyor's office. The committee also took upon themselves to ask for amended tenders, though they had no power to do so. There was one thing said at the last Council which struck him as being unreliable. Mr. Seekings made an assertion that the public baths at Cheltenham were 12 feet high to the wall plate, and that assertion was supported or confirmed by another member of the committee. He was so convinced that it was wrong that he made it his duty to go to Cheltenham and measure the wall plate of the baths, and he found it was 16 feet high. He had also sent a surveyor there who had measured it. He wished to prevent the Corporation being misled with regard to the dimensions of the baths.

Mr. Sydney-Turner moved that the ratepayers be called together by the mayor to decide upon the matter. Mr. Allen seconded.

Mr. Sydney-Turner's amendment was lost and Mr. Peake's resolution agreed to.

#### EDINBURGH PUBLIC LIBRARY.

A MEETING of the General Committee of the Edinburgh Public Library was held on Monday evening, Professor Masson in the chair. The minutes of the Books Committee stated the Library contained 22,709 volumes, exclusive of volumes in the hands of the binder. A letter was read from Mrs. Hodgson, Bonaly Tower, offering a donation of books, and it was agreed to accept the donation, with thanks. The Business Committee had agreed to increase the insurance of the library books by 2,000%. The minutes were approved. It was also reported that at a meeting of the Building Committee the architect, Mr. G. Washington Browne, submitted drawings for a proposed staircase, giving an access from the reference library floor to a large apartment over the principal staircase, which would be available for the storage of books, magazines, &c. It was unanimously agreed to authorise the addition.—Mr. John Harrison said that in the plan of the building there was a portion which came forward, where the doorway was. The part thrown forward to George IV. Bridge had a bare wall upon it, and the architect's proposal placed a round tower in the corner and broke up the monotony of the bare wall, besides giving access to the top flat, which was dummy to begin with. Additional storage was provided for 4,000 volumes.—The Chairman asked whether it was correct that the building would block up a view of the Castle?—Councillor Maclaren said there would be a good view of the Castle from the building.—Councillor Colston: A library is not a place for views.—The Chairman: It is rather a place for reviews.

#### THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

A SPECIAL general meeting of the above Association, called for the revision of rules, was held at Connaught Mansions, Victoria Street, S.W., on Saturday, July 21. Mr. Hugh Alexander, chairman of council, presided. It was unanimously resolved to add to the title of the Association the words "of Great Britain." The enlargement of the title is due to the wide extension of the movement inaugurated by the Association in 1883, to secure, by the union of all public sanitary inspectors, the interests of public officers, and also the higher interests of

the public health. The president, Mr. Edwin Chadwick, C.B., who was unable to be present, addressed a communication to the chairman cordially approving the proposed enlargement of title. The full title of the Association will be in the future "The Association of Public Sanitary Inspectors of Great Britain." Fifteen members and Associates were elected, and Mr. E. Lewis Thomas, M.A., was unanimously elected honorary counsel to the Association. It was announced that the Association had received and accepted a kind invitation from the Mayor to hold a meeting at Brighton in August, and the president, Mr. Edwin Chadwick, C.B., Dr. B. W. Richardson, F.R.S., and Sir Douglas Galton, F.R.S., had already promised to attend if possible.

#### A College of Architecture.

SIR,—Since your publication of my letters on this subject on June 22 and July 6, events have been occurring that not only seem to justify the proposal I ventured to make, but to call urgently upon the successful and influential men in the profession, and upon others taking an interest in art, to join together in aid of their younger brethren during the first stage of their architectural career.

It is true that much is actually done by the Institute and the Association for young architects who have fought through or shirked—as the case may be—their initial difficulties, but absolutely nothing that is specially intended for the assistance of the youngest. I need not enlarge upon the great importance and the wisdom of making the best possible use of this impressionable period of his life. For this purpose an architect's office is almost totally useless, or worse than useless, especially if it be what is called a good office, with plenty of work going on. The principal has far too much to do in the interests of his clients to be able to spare time in teaching his pupils, who, to learn all that is necessary, would absorb the whole of it. A stool in the office, which may or may not confer the afflatus of the Delphic tripod, must be accepted as sufficient consideration for the hundreds of guineas premium. Thus established, our neophyte—who may be anxious to learn or utterly indifferent—is necessarily left pretty much to himself, for he soon begins to think that making tracings and copying specifications is clerk's work, not his, and under these circumstances the occasional word of encouragement or instruction is not of much permanent use.

The obvious remedy is to adopt the practice of all other professions, namely, the establishment of a college in which a youth would acquire under the most favourable circumstances that elementary scientific knowledge that would enable him to profit to the utmost from two or three years of office work and business routine, and at the same time give really valuable assistance to his master. As an old architect, I confess to having felt some shame on reading the annual reports of colleges and the public distribution of prizes that have appeared in the papers during the last few weeks. I count twenty during the last week. What emulation must be excited in the youthful mind by the conferring of these honours amidst the acclamations of relatives and friends! And yet, to our shame be it spoken, we have established nothing of this kind, for, as I have said, neither the Institute nor the Association supply the want. So little sympathy had the full-grown members of the former for the struggles of the young architect, that they actually obtained permission some years ago to give the Queen's gold medal, originally intended for the encouragement of youthful ambition, unto themselves or to foreigners. This change was probably justifiable, and I only notice it to show that the Institute requires to be entered through the portals of the college if our organisation is to be perfect. The same may be said of the Association, because its evening classes—excellent things in themselves—are of use only to advanced students, whereas something is wanted to be of service to the youngest—something that will economise their time by enabling them to pass through a curriculum suited to their age in a properly arranged house, presided over by a small but suitable staff. A small beginning is what is wanted—development will surely follow. By this means I think architecture would in time become much more popular because better understood—parents naturally taking a warm interest in the work of their sons—and we should soon hear of the gift of scholarships and prizes, and, as in all other professions, of enthusiastic annual meetings presided over by princes and nobles.

Probably ere long we should be able to paraphrase the account of the annual meeting of the Royal College of Music thus:—"The College of Architecture has received a gift of 30,000%. Prince Christian was able to announce that the Commissioners of 1851 had granted a site for the new building."

The college is only five years old, yet it already possesses investments of over 120,000*l.*, and an annual income of nearly 13,000*l.*, exclusive of the above gift. It is as yet rather too early to judge the college by results. The roll of great English architects who will regard it as their Alma Mater has yet to be formed. In the meantime it is satisfactory to see that the college is well organised. A distinguished director heads the list of professors and teachers. The fees from pupils already bring in over 6,500*l.* a year, and the Queen heads the list of annual subscribers. The college has everything that should make it prosperous, and native taste ought to supply the rest. One day perhaps the new building may become the home of an English school of architecture. A steady determination to acclimatise architecture and to give it a national character has met with success among the French, and that circumstance ought to encourage a race perhaps not less richly endowed."

Permit me to say that your correspondents do not quite grasp my idea. I want to create a state of things for the comfort and benefit of the very young architect who is yet on the threshold of his career. They are thinking of him when he has finished, or nearly finished, his articles. With a college established and the goodwill of the profession secured, the pupil, after signing his indenture, would, with the mutual sanction of the parent and the master, be lodged in company with others in its pleasant courts. Work and play would be appropriately blended to suit the youthful constitution, and as soon as—but not until—the final examination was passed, the pupil would depart to take up his office work. The time occupied would vary according to ability and education. In some cases a few weeks, in others months. The sciences more or less connected with architecture would be taught rather than art, though this latter would, of course, not be altogether neglected. The grandest effects in architecture have depended quite as much upon constructive as upon artistic knowledge, and, if this be true, it is obvious that all those sciences pertaining to the theory and practice of building construction should be taught and impressed upon the young pupil as the essential groundwork of his future success. Art is so fascinating to the youthful mind that it may almost be left to take care of itself.

To conclude. I believe there is a very general conviction that something of this kind is wanted to make our organisation perfect. The Institute numbers about 1,000 members, and there are at least 10,000 architects in the United Kingdom. Surely such a work would be a worthy one for the profession to accomplish, and as a large part of it would probably consist of reorganisation, and as a small beginning would be sufficient, its magnitude does not appear to be very formidable.

THE WRITER OF THE ARTICLE  
"A COLLEGE OF ARCHITECTURE."

#### Competitions.

SIR,—The following correspondence which has taken place between myself and the Commissioners will be instructive, as showing the way in which the Clapham Public Library competition was conducted. I therefore send it to you for publication.—I am, &c.,

JOHN J. JONES,  
Author of Designs Spes A. & Spes B.

10 Lydon Road, Clapham, S.W.

(COPY.)

July 14, 1888.

To the Chairman and Commissioners for Public Libraries and Museums for Clapham.

Gentlemen,—I beg to submit for your consideration the following facts:—

1. On April 14 last I received from your secretary a letter inviting me to prepare, by way of competition, plans for your "selection for the erection of a public library on land at the corner of Orlando Road and Clapham Common," subject to certain conditions and stipulations contained in such letter.

2. Condition 11 therein contained stated that the cost of the building was not to exceed 3,500*l.*

3. In pursuance of such letter, I inspected the site of the proposed building, and found that the site plan sent to me by your secretary was grossly incorrect in outline and measurement.

4. In order that this inaccuracy might be brought to your notice, and an amended and correct plan supplied to the competitors, I saw your secretary and submitted to him the correct plan which I had made of the site.

5. Subsequently I again saw your secretary and called his attention to what seemed to me the inadequate sum mentioned in condition 11, and asked him whether he thought it was probable you would insist upon a strict compliance therewith, or whether the sum could be at all increased. He referred me to Mr. Morgan for information on this point.

6. I called on Mr. Morgan, and he informed me that the sum mentioned in condition 11 could not be exceeded.

7. Bearing in mind the information vouchsafed to me by Mr. Morgan, I prepared my designs in accordance with your instructions, and in my reports accompanying them I stated my willingness to obtain *bona fide* tenders to execute the work for the sum before mentioned.

8. When the designs were exhibited, I attended as one of the general public, and took notes of those of my fellow-competitors. I

found that mine were the only designs drawn to the correct site, and consequently the only ones that could be executed without serious alterations.

9. At your meeting on May 30, you appointed as your professional assessors, Messrs. Neighbour & Allcroft. They reported to you on the cost of the various designs, and, with regard to design "Light," stated that it exceeded the stipulated sum in condition 11 by 400*l.*, and that my design was the only one that could be executed for the sum of 3,500*l.*

10. The only conceivable advantage I could derive for the labour and expense involved in the preparation of my designs, was the fact that I should be placed on exactly the same footing as the other competitors with a possible view of securing the work. The fact of your having accepted the design "Light," by Mr. P'Anson, which, according to the report of the assessors appointed by yourselves, does not comply with your condition as to cost, and which moreover, having been drawn to a site which does not and never did exist, cannot possibly be carried out, is, as I think every fair-minded man will admit, a gross injustice to me and a flagrant breach of the conditions laid down by yourselves.

Apart, however, from my own opinion, I would venture to ask what inducement you considered you offered to me, as a professional man, except the nominal sum of 10*l.* 10*s.*, which I need not say represents but a tithe of the work done.

It was owing to the above facts that I returned your cheque for the sum of 10*l.* 10*s.*, which is totally inadequate remuneration for my services, and it is also owing to the above facts that I consider the public should be made acquainted therewith, and I therefore reserve to myself the right to publish this letter, together with any answer which you may think fit to instruct your secretary to send me.—I am, &c.,

JOHN J. JONES.

(COPY.)

July 19, 1888.

Dear Sir,—I read your letters of the 5th, 7th, and 14th inst., to the Library Commissioners at their meeting yesterday. The Commissioners have directed me to inform you that they must respectfully decline to enter into any discussion with you as to the choice which, after very careful consideration, has been made of a design for the proposed library. Kindly say if I shall return you the cheque of 10*l.* 10*s.* I have given instructions for your designs to be returned.—I am, &c.,

HENRY BULCRAIG, Hon. Sec.

(COPY.)

July 25, 1888.

Dear Sir,—I have to thank you for returning my designs. I am very surprised the Commissioners should have thought it necessary to ask the question contained in your letter of the 19th inst., with reference to the 10*l.* 10*s.*, and I shall feel obliged if you will, at the earliest date, inform them that under the circumstances I must again emphatically decline to receive any "honourarium."—I am, &c.,

To Henry Bulcraig, Esq.

JOHN J. JONES.

#### City of London College.

SIR,—The result of the last May examinations of the Science and Art Department in Building Construction shows that at the City of London College three of the students passed in the honours stage, eleven in the advanced, and thirty-six in the elementary. Of the latter twenty-one received first-class certificates, and out of the fifty-three candidates only three failed, all in honours. These classes are under the able guidance of Mr. Henry Adams, who proposes next session to develop a new feature which promises to be very successful. This is, to give an additional course of about thirty lectures upon details of building construction, freely illustrated by diagrams, at which students may take notes without being under the necessity of making drawings as heretofore. The ordinary course will be continued as usual.—Your obedient servant,

July 26, 1888.

D. SAVAGE, Secretary.

#### LEGAL.

##### Court of Appeal.—July 30.

(Before the MASTER OF THE ROLLS, LORD JUSTICE LINDLEY, and LORD JUSTICE BOWEN.)

PRIESTLEY AND ANOTHER *v.* STONE.

ACCURACY OF QUANTITIES.

This was an action by builders against a quantity surveyor. The Rev. Reginald Tuke, when about to build a Roman Catholic church at Chiswick, had employed one Kelly, an architect. Kelly prepared the plans and instructed the defendant, a quantity surveyor, to take out the quantities according to the plans. The defendant accordingly prepared a bill of quantities, had a number of copies lithographed, and handed them to Kelly. Kelly thereupon applied for tenders for the building of the church, and the plaintiffs, among others, tendered. Another tender was accepted for a certain sum. The plaintiffs brought this action to recover damages for injury caused by the alleged negligence and breach of duty of the defendant as quantity surveyor, in preparing an inaccurate bill of quantities. The plaintiffs based their claim upon the ground that the defendant, by preparing the bill of quantities, represented that the same was correct, and would be sufficient for the building

of the church according to the plans, and that it was the duty of the defendant to use ordinary care and skill in the preparation of the bill of quantities, knowing that tenders would be made upon the faith thereof. The defendant, in his statement of defence, denied that he was negligent, and said that there was no privity of contract between him and the plaintiffs, and that he did not owe any duty to the plaintiffs. He also denied that there was any inaccuracy in the bill of quantities, and alleged that the plans were altered after the quantities had been prepared. At the trial before Mr. Justice Stephen without a jury, the judge gave judgment for the defendant. The plaintiffs appealed.

Mr. Edwyn Jones argued for the plaintiffs; Mr. Spokes, for the defendant, was not called upon.

The Court dismissed the appeal.

The Master of the Rolls said that no such action as this had been known before the present case. The contract as to taking out the quantities was made between the architect and the quantity surveyor and not with the builders. The surveyor was employed to take out the quantities for the architect, and handed them to him; and the surveyor had no control over the way in which the bill of quantities was used. The quantities might not be used at all, and they did not amount to a representation that they were true in fact. The architect could check them. If the bill of quantities were fraudulently made the case might, perhaps, be different; but the case at the trial was not put upon this ground, and there was no evidence of any fraudulent or reckless statement. The quantity surveyor was not bound to conclude that the bill of quantities would be shown to any one. The architect, in fact, might alter the quantities before sending them to the builders. This was an attempt to manufacture a new action which the Court would not sanction.

Lord Justice Lindley concurred. There was no privity of contract between the builders and the quantity surveyor. The custom relied upon as to privity between builders and quantity surveyors was not proved, and, even if proved, the custom would probably be held to be unreasonable and bad within the decision in "*Bradburn v. Foley*" (3 C. P. D. 129). It was there put upon the ground that the defendant, in effect, made a negligent representation to the plaintiff. The real truth was that the defendant was employed by the architect, and not by the builders, and there was no such representation. In his opinion there was no evidence of want of reasonable care.

Lord Justice Bowen also concurred. The action was without precedent. There were two fatal objections to the plaintiffs' claim—there was no privity between the plaintiffs and the defendant, and the defendant owed no duty under the circumstances to the plaintiffs, as duty would only arise from privity. It was said that the defendant made a misstatement which he knew would be passed on to other persons, and that he was liable on the authority of *Peek v. Derry* (37 Ch. D. 541). In applying *Peek v. Derry* it was always important to consider the meaning of the word "statement." If a man made a statement as upon his own belief, he either believed it or he did not. If he believed it, the statement was true; if he did not believe it, the statement must be fraudulent. The decision in *Peek v. Derry* could not apply to such a case as that. But it would be otherwise if a man made a statement outside his own belief. A quantity surveyor was, of course, bound to take reasonable care in taking out quantities. But he made no representation that he had taken such care. He only represented that those were his quantities—a statement as to his belief. Therefore, assuming that there was evidence of negligence in the defendant, it was not enough to render him liable to the plaintiffs. Even assuming that a fraudulent misrepresentation, or one so reckless as to be fraudulent, would render the defendant liable to the plaintiffs, that case was not put at the trial, and there was no evidence of it.

### GENERAL.

**The Annual Exhibition** of works of art submitted in the national competition, in connection with the Science and Art Department, was opened on Saturday at the South Kensington Museum.

**A Collection** of examples of the older water-colourists, and a series of the seventy-one mezzotint etchings of the "*Liber Studiorum*," have been presented to the Oldham Art Gallery by Mr. C. E. Lee.

**An Exhibition of Pictures** has been opened in the Dudley Gallery, Birmingham. It is the first time since the establishment of the gallery that a collection of notable works has been obtained.

**The Mayor of Chester** has built and presented to the city a reading-room as a Jubilee memorial.

**The Justices of the Peace** for Arbroath district on Monday refused to grant a theatrical license for a wooden theatre in Reform Street, on the ground that the premises were not suitable.

**Mr. Hutchison, R.S.A.**, has just completed in clay the bust of the Queen for the Victoria Art Gallery, Dundee, and has been further commissioned to execute a bust of the late Prince Consort.

**The Leeds Fine Art Gallery**, it is expected, will be finished and opened in October. Among the modern works will be *Napoleon on Board the Bellerophon*, by Mr. Orchardson. Sir Frederick Leighton, Mr. Cope, and Mr. E. Armitage have promised to lend examples of their work.

**A Collection** of water-colours and oil-paintings, principally of the English school, has been lent to the Nottingham Castle Art Museum, by Mrs. Moysey, of Leightonstowe, for exhibition.

**The Coventry Guardians** have decided on building an infirmary containing 150 beds, the estimated cost being 2,500*l.*

**Mr. S. W. Kershaw, F.S.A.**, read a paper on East Barnet Church, on occasion of the visit of the London and Middlesex Archaeological Society to that district last week.

**The Dublin University** has conferred the degree of Master of Engineering upon Sir Lowthian Bell and Mr. Ramsbottom.

**The Personal Estate** of the late John Waddell, of Edinburgh, contractor, amounts to 139,962*l.* 10*s.* 5*d.* The estate is to be distributed between the widow and family.

**Mr. B. W. Adkin, P.A.S.I.**, has opened offices at 33 Walbrook, E.C., in connection with his practice as a surveyor.

**The Sheffield Chamber of Commerce** has adopted a resolution in favour of the construction of a canal from Sheffield to Goole. It would be fifty miles long, and cost 1,000,000*l.* The scheme has the approval of many of the local manufacturers.

**The Civil List Pensions** for the year ending June 20 last include the following:—Sir John Steell, in consideration of his merits as a sculptor, 100*l.*; Miss Mary, Miss Rose Jane, and Miss Amy Leech, in consideration of the eminence of their brother, the late Mr. John Leech, as an artist, 10*l.* each; Mrs. Eugenia Moira, in recognition of the eminence of her late husband as a miniature painter, 25*l.*; and Mr. John Bell, in recognition of his merits as a sculptor, 50*l.*

**A Library and Reading-room** is to be built on the Kensington Fields, Liverpool.

**Mr. Allen**, of Gravelley Hill, was on Wednesday found liable, at the Birmingham Police Court, under the new by-laws relating to new streets, courts and buildings, for infringement in covering up drains before inspection, and for building a water-closet without depositing plans, in connection with seventeen dwelling-houses in course of erection.

**The Belfast Society**, in conjunction with the Dublin Naturalists' Field Club, made last week an archaeological excursion in the Drogheda neighbourhood. Slane, its abbey and hermitage; Monasterboice and Mellifont, and the prehistoric cemetery of Brughna-Boiane, an assemblage of tumuli and other sepulchral remains, said to date probably from the earliest epoch.

**A Report** by Messrs. Demaine & Brierley, architects, of York, on the church of St. Michael-le-Belfry, states that a good deal of the stonework, especially the carved and moulded parts, is in a state of very rapid decay, the estimated cost of repairs being 1,033*l.* A committee has been appointed to carry out the work.

**The Fifty-sixth Annual Report** of the Commissioners of Public Works in Ireland was issued on Monday. During the past year the commissioners made 1,321 loans for public works, amounting to 829,766*l.* Twenty-four loans were made in 1886-87, to the amount of 79,161*l.* for building 852 labourers' dwellings, whilst last year applications were received for loans amounting to 50,183*l.* for the same purpose, of which twenty, to the amount of 34,746*l.*, have been sanctioned.

**The Budget** submitted to the Victorian Legislative Assembly at Melbourne last week included several items of interest to the building trade. It is proposed to sell the valuable sites near Melbourne occupied by the Lunatic Asylum, and it is expected that 1,000,000*l.* will thus be realised. The cottage hospital system is to be introduced in the country districts. With the proceeds of the sites it is proposed to expend 400,000*l.* in the construction of new asylums on the cottage principle, 100,000*l.* for the completion of the Parliament Houses, 95,000*l.* for university requirements, 90,000*l.* for a public library and national gallery, 25,000*l.* for a military college, 20,000*l.* for a workmen's college, 25,000*l.* for an agricultural college, and 60,000*l.* for the Warrnambool breakwater. It is also proposed to sell the site of the police-court to the City Corporation of Melbourne for 140,000*l.*, and appropriate the sum to purchase a property in Melbourne on which law offices, &c., will be erected for the same amount.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. **ROBERT BOYLE & SON, Ltd.**

R. Hird & Son, Bradford, painter	58 10 0

## IMPROVED FLAT BRICK FIRE-PROOF FLOORS.

No. 1.—Longitudinal Section.

No. 2.—Longitudinal Section.

### NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with specially moulded dovetail projections, forming a mechanical key to hold the plaster protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

## TRADE NOTES.

THE Prince and Princess of Wales opened, on July 17, the new buildings of the Great Northern Central Hospital, Holloway Road. The total cost of the building, the architects of which are Messrs. Young & Hall, when completed, will be about 45,000*l.* The portion now opened will cost 23,000*l.* Special attention has been paid to the sanitary and ventilation arrangements, Boyle's latest improved Patent Self-acting Air-pump Ventilators being used on certain portions of the building.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his Patent Manchester Warm-air Stoves to warm the day-rooms of Ballinasloe Lunatic Asylum, Mr. J. F. Kempster being the architect.

THE contract for erecting twenty-two lightning conductors at the Whittingham County Asylum, Preston, has been given to Mr. Joseph Blackburn, of Gresham Works, Nottingham, who is also improving the whole of the present system with his registered holdfasts. He has recently fitted the Nottingham new Law Courts throughout with electric signals and speaking-tubes.

MR. SAM DEARDS has been favoured with the order of Mr. W. G. D. Goff, of Waterford, to erect for him a new range of glass-houses, and all to be glazed on the now very well-known system of the Gold Medal "Victoria" Dry Glazing:—One conservatory, 45 feet by 25 feet; one orchid-house, 34 feet by 18 feet; one fernery, 26 feet by 16 feet; one early vinery, 36 feet by 16 feet; and one late vinery, 36 feet by 16 feet.

## SPRAGUE &amp; CO.

Lithographers, Engravers, and Printers, 22 Martin's Lane, Cannon St., London, E.C.

BROOKSIDE WORKS, GODLEY, MANCHESTER.

A FINE public clock is now being erected for the Town Hall, Birkdale, Southport, Lancs., being presented to the town by the proprietor of the Birkdale Estates. The clock will strike the hours, and show the time on three external illuminated dials, and is constructed from the designs of Lord Grimthorpe by Messrs. Wm. Potts & Sons, Guildford Street, Leeds, who are also making a large illuminated quarter-chime clock for the inhabitants of Paddock, near Huddersfield, to be erected in the parish church. Mr. Joseph Crosland, J.P., Royds Wood, is kindly giving the bells. Messrs. Potts are also erecting a large illuminated clock at East Cliff Congregational Church, Bournemouth, and chimes for the parish church, Leeds, and new clock for Preston Church, near Leeds.

It is gratifying to see that electric lighting is rapidly becoming more popular, and, unrestricted by laws, promises to become as cheap as any other system of lighting. We notice, for instance, that the Bath local authorities have decided to adopt electric light throughout the city; and after some delay in deciding upon the particular system, have given the whole contract to Messrs. Laing, Wharton & Down, of 82 New Bond Street, W., the proprietors of the Thomson-Houston light. If practical success were any guide to their decision, then Messrs. Laing, Wharton & Down would have many credentials, notably the lighting of the American Exhibition and the present Italian Exhibition, which have been unequalled for effectiveness. Mansions, clubs, and offices have been lighted with equal success. The showrooms of the firm at 82 New Bond Street, which we inspected the other day, are charmingly fitted up with every design of electric-light fittings, in bronze, wrought-iron, &c., and are entirely lighted by their system; so that a visit should give an excellent idea of the quality of the light and every appliance connected with it. Messrs. Laing, Wharton & Down manufacture every requisite themselves, and contract to do work under their own supervision in any part of the country.

#### BUILDING IN LOS ANGELES.

THE last report from Mr. Vice-Consul Mortimer has the following remarks on building in the Los Angeles district of California:—

The price of real estate has advanced steadily for the past four years, and in this city has reached such a figure that the prospect of a further rise can only be predicated on the

assumption that within four years the population will have reached 250,000, which I think by no means improbable. The extraordinary demand for landed property is best illustrated by the fact that in this city alone there are nearly 2,000 persons paying license as land-agents. 8,000*l.* was recently paid for a lot 20 by 100 feet, or at the rate of 400*l.* a front foot; 600*l.* per front foot was offered and refused for another lot in the centre of the city. At this rate an acre divided into lots 100 feet deep would be worth over 260,000*l.*, or a good deal more than twice as much as by cablegram I see was recently paid for land in Cecil and Salisbury Streets, London.

Upwards of 100 towns and settlements have been laid out within the past year in this district, and I am informed that there are 40 new cities on the line of the Atlantic and Pacific railroad between Los Angeles and San Bernardino, a distance of 60 miles. At the first sales of lots in many of these new cities in May and June last many persons remained standing in line in front of the places of sale for more than 24 hours for the privilege of buying a lot. As a specimen of the mode of advertising lots in these embryo cities the following, taken from the Los Angeles daily papers, will strike English readers as peculiar:—"In God's all-seeing eye there is no place like—" "A lot in — is better than being in Abraham's bosom," &c. It has been stated half seriously that one can walk on "city" lots from Ontario to Los Angeles, a distance of 40 miles. Several of these new-born cities are being built up very rapidly, and are increasing marvellously in population; many of them, however, are destined to revert to farming lands. The frantic speculation in lots in almost all the new cities has entirely ceased, and the "boom" has to some extent abated throughout the whole district. In this city the permanent improvements now being completed, and for which contracts have been made, preclude the possibility of any material decline in prices. The estimated value of the buildings now being constructed exceeds 500,000*l.* United States Government and municipal buildings to the value of 200,000*l.* will be erected this year. A company has commenced work on the construction of cable railways through the streets of the city, which, when completed, will cost not less than 300,000*l.* The fact that Los Angeles is connected with the Eastern states by two competing trans-continental lines of railway, and that a third, the Los Angeles and Salt Lake City Railway, is projected, and will probably be carried to completion in the near future, is the best indication of the estimation in which this district is held throughout the country.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

# LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

#### TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

Considerably Reduced Price List, November 1, 1887.

ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

W. & R. LEGGOTT, General Brass and Ironfounders and Finishers, Makers of Patents and Specialities,  
**235 HIGH HOLBORN, LONDON, W.C.;**  
**109 HOPE STREET, GLASGOW; SILENS WORKS, BRADFORD.**  
TELEGRAPHIC ADDRESS—"SILENS BRADFORD."

I am informed that persons in Canada and England have invested in real estate here tempted by glowing advertisements. The risk of speculating in real estate to persons living at a distance, and whose information as to values, &c., is obtained merely through some advertising medium, is enormous. The mere fact that a real estate firm is highly commended in a daily paper proves nothing. A short time ago a firm described as "gentlemen," "honest," "trustworthy," "enterprising," and "energetic" was a few days later fully exposed as an organised set of swindlers, and this is by no means an isolated instance.

The system in use here for transferring and mortgaging land is a poor one. Private enterprise has, however, supplemented the deficiencies of the official records. A company has taken copies of such records, and is now keeping them in accordance with the system in use in the province of Ontario, Canada. This company now issue title insurance policies guaranteeing the owners of the lands insured against loss on account of defects in title.

#### NATIONAL MASTER BUILDERS.

ON the invitation of the Liverpool Association of Master Builders, a company of one hundred members of the National Master Builders' Association of Great Britain paid a visit on Thursday in last week to the Manchester Ship Canal Works at Eastham.

The party had placed at their disposal the Eastham ferry steamer *Fairy Queen*, on board of which, having embarked at the Prince's Landing-stage, they had a cruise on the river and saw the North Liverpool Docks, New Brighton, Birkenhead and the South Liverpool Docks and Garston. From the latter point they crossed the estuary to Ellesmere Port, and then returned to Eastham. Here they landed and took luncheon at the Eastham Ferry Hotel. The chair was occupied by Mr. C. W. Green, president of the Liverpool Association, and the company included Mr. R. Neill, jun., of Manchester (president of the National Association), Mr. George Burt (president of the Institute of Builders of Great Britain), Messrs. S. G. Bird and R. S. Henshaw (London). After the customary loyal toasts, that of the National Association was given by the chairman, and responded to by Mr. R. Neill. "Success to the Manchester Ship Canal" was also drunk, on the proposition of the chairman. Mr. Fitzgibbon, who represented the pro-

motors and engineers, responded. The chairman also gave the health and success of the contractors, whose attention and courtesy, he remarked, had given the Association such facilities for viewing the operations. The toast was heartily drunk, and Mr. F. Donaldson, engineer to the contractors, replied. The next toast was that of the Liverpool Association, which amidst great applause was submitted by Mr. Dennett, of Nottingham, one of the vice-presidents of the National Association, and acknowledged by the chairman. Responding to the health of the "Architects, Surveyors and Engineers," Mr. G. E. Grayson said both Liverpool and Manchester had taken great interest in the Ship Canal scheme, and personally he had always felt that it would at all events do her no harm and Manchester much good.

The company then sallied forth into the wildernesses of clay embankments and wooden houses which at the present stage form the aspect of the canal, and which look, especially as regards the dwellings, as if Eastham were a mushroom town in the wild west. To accommodate the 1,600 men employed on the Eastham section of the canal naturally requires a good-sized, though scattered, village of such wooden erections, which, however, are substantial enough in their way. Four hundred yards from Eastham ferry the entrance of the canal commences, but between the two points there is now in course of construction an embankment that will be faced with rubble-stone and backed with the marl taken out of the immense cutting for the canal. Hundreds of thousands of tons of earth have been removed to make the embankment during the six months which have elapsed since operations began, and more has been taken out to make the embankment separating the canal from the estuary. However, with the nine steam navvies now at work, and a large use of locomotive power, the progress at this point has been more rapid even than the contractors anticipated, for as the promoters have to pay interest out of capital the work is pushed forward both by day and night. The visitors were shown over the works by Mr. F. Donaldson, engineer for the Eastham section to the contractor, Mr. T. A. Walker, of Manchester. The party, by means of the temporary railway laid along the bed of the canal, had the advantage of a run until close to Ellesmere Port. The means of conveyance were goods trucks fitted with planks for seats, but the Association were all well used to building operations, and roughing it. In this way the visitors saw the whole of the works. Of the four and a half miles which form the length of the Eastham section, about three run through the land on the southern shore

Preston's Patent Screw  
Adjustment,  
For opening, closing, & fastening Windows.

A 553.

## JAMES CARTLAND & SON, Cabinet, Builders' & Furnishing Brassfounders, BIRMINGHAM.

The Extent, Variety, and Finish of Articles Manufactured at this Establishment cannot be excelled.

THE REGISTERED DESIGNS AND PATENTED ARTICLES ARE NUMEROUS AND VALUABLE.

All Goods for Export are CAREFULLY PACKED IN CARTON BOXES, and distinctly labelled with Orange-coloured Labels, bearing the Trade Mark as at side.

The attention of Architects and Builders is specially drawn to the merits of PRESTON'S PATENT SCREW ADJUSTMENT for Opening, Closing, and Fastening Windows of Churches, Board Schools, Warehouses, and Manufactories, as its extreme simplicity cannot fail to commend it.

An endless Cord passing over a grooved Pulley, and worked by hand, causes the Box to travel on Screw, carrying the Sash with it to the required distance, and remaining securely locked at any angle. The action is perfectly easy and a child can adjust it.

**W. NOBLE,**  
BUILDER AND CONTRACTOR, BOILER SETTER, OVEN AND FURNACE BUILDER,  
High Street, Sutton, Surrey,

AND AT

HORSE SHOE WHARF, UPPER THAMES STREET, E.C.

SOLE PATENTEE OF THE SELF-ACTING

**SMOKE-CONSUMING AND REGENERATING FIRE LUMP BRIDGES,**

Specially cast to suit all kinds of Boilers.

At the above Exhibitions, Fourteen of W. NOBLE'S PATENT BRIDGES were used for the economising of fuel and the consuming of smoke, to the entire satisfaction of the Chief Engineer (A. CAREY, Esq.), and Surveyor to the Royal Commissioners (WILSON BENNISON Esq.).

of the estuary. This length has been much more than half excavated through. For a considerable depth the land consists of marl and sand, but lower down there is a bed of red sandstone rock, which has to be blasted out. At the same time a vast amount of the stone thus quarried is valuable for constructive purposes, and it is estimated will greatly reduce the total cost. It is carefully dressed into oblong blocks. From the top of the banks to the bottom the depth, in perpendicular, is 60 feet, and as the width from bank to bank is 300 feet, there is now about the works generally a good deal of impressive perspective. The entrance will be furnished with three parallel locks, each 900 feet long, and capable of passing the largest vessels now afloat, and the depth of water to Manchester will be 26 feet. Much interest was taken in the steam navvies, which are, roughly speaking, steam cranes, with the digging arrangement applied to them, and capable of being used either as navvies or as cranes. Each, it is said, will remove 600 cubic yards, or about 1,000 tons, of earth a day, and their incessant working, together with the constant passing to and fro of trains of trucks and waggons, make the whole scene one of extraordinary animation.

Returning to Liverpool on board the *Fairy Queen* after the visit, Mr. R. Neill, jun., expressed on behalf of the National Association the thanks of the company to the members of the Master Builders' Association of Liverpool for having entertained them during their visit. Messrs. Cowlin and Dennett, vice-presidents, Mr. G. Burt, Moulson, and others, also expressed their acknowledgments to the Liverpool Association, who were accorded a vote of thanks. A further vote of thanks was passed to Mr. W. Knox, the local secretary, for having successfully carried out the arrangements for the visit.

#### SOFTENING AND PURIFYING WATER.

ON Saturday, July 21, by permission of Messrs. Ellington & Woodall, the Society of Civil and Mechanical Engineers visited the pumping station of the London Hydraulic Power Company, now in course of erection in Millbank Street, Westminster; and also the pumping station at Falcon Wharf, Blackfriars, which has been at work for some five years. At the former station much interest was shown in the Porter-Clarke process of softening and purifying the water to be used, and also in the immense cast-iron storage tanks and filters which

form the roof of the building. The energy is stored in accumulators, loaded to a pressure of 740 lbs. on the square inch, the water being pumped up into them by Ellington's patent compound-surface condensing direct-acting pumping engine. Much praise was bestowed upon the handsome buildings which the company are erecting in Westminster.

#### INSTRUCTION IN DRAWING.

FOR some weeks past arrangements, the *Birmingham Post* says, have been in progress between the School Board and the Museum and School of Art Committee of the Town Council for the supervision by the latter body of the teaching of drawing in all the boys' departments of the Board schools within the borough, and for the actual instruction in art subjects, at the Central Municipal School of Art in Margaret Street, by officers of that school, of the male pupil and candidate pupil-teachers under the Board. The arrangements are now complete; and, as the new scheme is likely to lead to an important development of the art work of the town, some particulars may be of interest.

In consideration of the annual payment by the School Board of the sum of 300*l.*, the Museum and School of Art Committee have undertaken the satisfactory performance, by officials of the school, of the following duties:—I. With regard to the drawing taught in the boys' departments of the Board schools: (1) the frequent and regular inspection of the drawing taught in each of the boys' schools; (2) the arrangement with the head master of each Board school of the course of instruction in drawing and the proper classification of scholars for that subject; (3) the giving of model lessons so often and of such a character as to instruct the class-master in his methods of teaching; (4) the examination of the drawing done and the transmission to the head master of the Board school of written criticisms and suggestions thereon; and (5) the supply to the School Management Committee of the Board, at regular intervals, of reports on (a) the drawing in each boys' school, and (b) the results of each of the drawing examinations conducted by the Department of Science and Art.

II. As to the instruction in art subjects of the male pupil and candidate pupil teachers under the Board:—(1) The giving of that instruction, by competent masters, at the Central School, Margaret Street, on Thursdays, from 7.15 to 9.15 P.M.,

throughout the session, which lasts from the second Monday in September till the last Friday in June; (2) the provision of suitable examples, fittings, &c.; and (3) the transmission to the Board at regular intervals of reports on the attendance and work of the students in question. The head master of the Municipal School of Art (Mr. Edward R. Taylor) has undertaken to give, at the beginning of the coming session, to all the masters of the Board schools, an address, illustrated by diagrams, on the methods of teaching drawing. Steps have already been taken to carry into effect the above-mentioned arrangements. With regard to the work in the day schools, the town has been divided into three districts, according to the position of the Board schools. The number of schools in these districts are respectively 13, 13, and 14, and an inspecting teacher of drawing has been appointed for each district. The duties of an inspecting teacher will be to visit the schools in his particular district, in order to carry out the arrangements named with regard to the day schools. One hour and a half per week is, as a rule, devoted in each boys' department to the teaching of drawing, in accordance with the syllabus published in the Science and Art Directory. Having regard to an undertaking made by the School Board as to the arrangement of the time-tables, it is considered that an inspecting teacher can adequately perform his duties if he devotes six half-days per week to visiting the schools in his district, and is required to inspect each of those schools at least twice a month, the visits, as a rule, to any one school to occupy the whole of one half-day each. Most of the advice in regard to the teaching of drawing will, no doubt, be given verbally by the inspecting teacher. All the inspecting teacher's written reports—such as those required by paragraph 4 of the arrangement with the Board—must be done in copying ink, and handed by the inspecting teacher to the secretary of the Municipal School of Art; and the latter, having obtained a copy of each report, will forward it to the master of the Board school. The copies of these reports will be required for reference, *e.g.* for use when the secretary despatches to the Board the general reports mentioned in paragraph 5 of the arrangement. All communications of importance, other than the inspecting teacher's reports, will be sent to the master of a Board school through the hands of the clerk of the School Board; and the School Board will make, in writing, no official communications whatever with the inspecting teachers, save through the secretary of the School of Art. It will be observed that, although instruction in drawing is usually given at any school for only

one hour and a half, the inspecting teacher's visit will, as a rule, occupy a whole half-day, or two hours and a half. The remaining hour will be devoted to the examination of the drawing done, to consultations with the teachers in regard to their work, and to writing the required report. Two teachers have been appointed to instruct at the Central School, on Thursday evenings, the male pupil and candidate pupil teachers. The opinion was strongly expressed that two of the three inspecting teachers should give this instruction, and this arrangement has accordingly been adopted. The inspecting teachers will thus be brought into closer connection with the teaching staff of the Board schools, and be enabled to emphasise by their own methods of teaching the views expressed on their visits to the schools.

By this arrangement nearly all of the remaining rate-aided art instruction of the town has been placed in the hands of the authority especially appointed to direct work of this nature. The result will doubtless be beneficial in many ways. Not the least useful outcome of the scheme will probably be found in the fact that, after leaving a day-school, and on joining classes connected with the Municipal School of Art, a boy will have already mastered many of the preliminary difficulties, and will also be able to continue his art studies in the evenings on the same system as will now be pursued in the day schools.

#### GLASGOW CENTRAL RAILWAY.

THE Glasgow Central Railway Bill passed the Select Committee of the House of Commons on Tuesday. Its object is to connect by railway the east and west ends of Glasgow, at a cost of a million and a quarter. It proposes a line of railway beginning by a junction with the Dalmarock branch of the Caledonian system, going to the east of Glasgow, proceeding underground along two of the main streets of the city—Argyle Street and Trongate—and then proceeding on to Maryhill, the village of that name. The scheme will be carried through by independent promoters, but the parties actually interested in it are the Caledonian Company, to whom the extension will be a great advantage. It will connect them directly with three-fourths of the coalpits of Lanarkshire and the Stobcross Dock, the largest dock in Scotland. The Caledonian is at present connected with these pits, but not directly, and the new line will save eight and a half miles. It

will further give direct access to the Caledonian system, and now that the Caledonian have, by this Bill, got to Maryhill, it seems probable that the company will invade Dumbartonshire, and compete with the North British for the Helensburgh traffic and the tourist traffic to Balloch for Loch Lomond.

### DRIPS AND WEATHERINGS.

IN seasons such as we have experienced of late, when rain forms the most prominent feature of the elemental conditions, a little consideration of the subject of drips and weatherings is not out of place. Notwithstanding the advance made in building construction, sanitation, and the like, little attention appears to have been given to this important matter till within the last four years. Drips for many years past have been formed by lead coverings, grooves in bricks, and throatings to stone cills and copings. In most of these the projection is insufficient, the rain-water finding its way to the brickwork, causing dampness and destruction. Little need be said about lead coverings, the cost being the great objection to their frequent use. Weatherings for chimney stacks, parapets, and walls generally, are of two kinds—the oversailing brick, with its sloping filled, and the tile creasing, similarly treated. As to treating the two modes as equal to each other, Mr. Ewan Christian's remarks at the Inventions Exhibition may be quoted. He said the old mode never did weather the walls, there being no drip. It has been agreed that when the rain-water left the lower edge of the oversailing brick or tile creasing, it was never ascertained what became of it, whether it ran down the walls or fell upon the roof, but it was more likely to be the former. Happily, four years since, drip-tiles were introduced by Mr. J. Robson, of Fitzroy Street, Fitzroy Square, and, in spite of the prejudice against new things, these tiles have found their way to all parts of the country, and many of the largest buildings in London. They have been specially made for window-cills for St. Paul's new church, Kensington; most of the Fire Brigade stations' walls are weathered, and they have given the Metropolitan Board every satisfaction. They will be found in the Royal Music Hall, St. Mark's Institute, the Clock House, and many important structures. These tiles are of two kinds:—No. 1, specially made for cornices, set-offs, &c.; No. 2 is adapted to chimney-stacks, walls, &c., and may be used for a host of purposes, and their

use has been extended to the protection of fruit trees growing against garden walls; but for general purposes it has been admitted to be the most effective and slightly drip in the market, and being 60 per cent. cheaper than tile creasing, only requires one trial to secure the lasting patronage of the architect.

### BRICKMAKING IN BEDFORDSHIRE.

AN excursion has just been made from London by the Geologists' Association to Bedford, where the party was met at the railway station by several members of the Bedford Archaeological and Natural History Societies, led by Mr. Cameron, who acted as conductor during the day. The party first walked to the waterworks pumping station, and inspected the heading in the limestone rock whence the town water supply is derived. Mr. Franklin's brickyard and limestone pits and works in the fields adjoining were then visited, Mr. Cameron explaining the formation and nature of the rock sand clays, and he also read a paper on the "Brickmaking Industry at Bedford." The brick earth here, he said, is the Oxford clay, prepared alone or with an admixture of the "mild clay" of the builders—the Kelloway loam and sand which is usually obtainable in the same brickfield. Boulder clay is not used. In this particular field in which we are assembled the lower Oxford beneath the Kelloway is the clay dug; this being mixed in the pugmill with the blue Kelloway loam produces an efficient brick earth. The brickmaking season commences in April, and is carried on with great activity throughout the summer. Still winter is a busy time, for it is then that the clay is dug, and stacked, and piled in heaps, and left to weather in the frost which breaks up and crumbles the jumps. In spring the heaps are turned over and sufficient water added to give plasticity to the mass, care being taken in stirring the clay to pick out the fossils or stones, as these if allowed to remain crack the clay in drying and burn into white lumps, making the bricks unsound; for as these lumps weather out they leave the bricks riddled with unsightly holes; and if a piece of limestone no bigger than a pea be allowed to remain it will destroy any brick into which it may find its way. Hundreds of *Gryphaea* lie amongst the clay in some brickyards, and where there are so many not a few escape observation, so that unwittingly the shell of the departed lamellibranch becomes cremated at the last. Scarcely a shell of any kind can be

Estimates and Designs on Application.

found at other brickpits, such an unfossiliferous bed being, of course, all the better for brickmaking purposes. Again, there are pits where belemnites can be gathered by the bushel. In April the clay is ripe or mellow, and in readiness for the moulder. With a well-appointed yard a man can make from 1,000 to 1,200 a day of twelve or fourteen hours, and he generally works that length of time. When steam power is used 50,000 is the output for the day. Here, with ten moulders, 10,000 to 12,000 bricks are made in a day. A raw brick has to be dried with great care. Kilns for burning are erected in many ways, and scarcely any two are exactly alike. In Bedfordshire the kiln most often seen is a rectangular one, known as the furnace kiln, having the furnaces running underneath the whole length of the structure. The main mass of Oxford clay being buried here almost to the water's edge beneath boulder clay, is not conveniently available for brickmaking purposes, what is used being the Lower Oxford, a clay bed subordinate to the Kelloway. The Cornbrash clay—the purple clay beneath that stone—is not used, or only to the small extent of having the upper 2 feet sometimes mixed in the pugmill with the other beds of clay and loam. Brick colouring is an interesting feature in the art of brickmaking, besides being an important item in its commercial value. The colour depends upon the amount of iron present in the clay, modified in some cases by the firing in the kiln. There are only grey clays in Bedfordshire, which weather yellow in their upper part, and from these are produced the red building bricks, mixed bricks, and the pale buff or cream, generally called white bricks.

#### PRESTON DOCK WORKS.

THE Corporation of Preston have made an arrangement with Mr. Walker, the contractor of the Preston Dock Works, for the suspension of operations for twelve months, in accordance with the recommendation of the Select Committee of the House of Commons. The agreement for the suspension specified that the men should cease work on the 28th ult.; that there shall be paid about 34,500*l.* to Mr. Walker as retention money; that there shall also be paid 5,000*l.* for the maintenance of the works by pumping and by protecting the stonework from the effects of frost. Mr. Walker will not be responsible for the silting up of the new diversion. It is said most of the men from the dock works will be taken to the Manchester Ship Canal.

#### WALL AND CEILING DECORATION.

THE accompanying sketches show samples of the high-class wall and ceiling decorations manufactured by the Anaglypta Company, of 92 and 93 Great Russell Street, W.C., at their works, the Queen's Mill, Lancaster. These beautiful and inex-

pensive products of the Anaglypta Company cannot be too highly recommended, and in addition to possessing all the qualities that can be needed from a sanitary point of view, as also durability and suitability for all purposes, the artistic treatment, over which it can easily be seen no pains has been spared, has been one great factor in causing it to find favour

with the public in many directions. Briefly, the wall and ceiling coverings are practically indestructible, and they are produced in a large number of varied designs, most of which are of the highest artistic merit, many of them being designed by the best living artists. They also form the cheapest substantial relief decoration that can be found anywhere.

#### BUILDERS' BENEVOLENT INSTITUTION.

THE 41st annual meeting of this institution took place on July 26 at Willis's Rooms, St. James's, Mr. H. H. Bartlett, the president, in the chair. Major Britton, the secretary, read the annual report, which stated that the income had not been sufficient to maintain the charity, and that recourse had to be made to the remainder of the reserve fund to meet the liabilities for the support of the pensioners. That fund was now entirely exhausted, and an urgent appeal was made for sufficient funds to carry on the institution for the forthcoming year. Should that appeal not be liberally responded to, some of the funded property would have to be realised, a misfortune which well-wishers of the institution would much regret. During the past year the committee had only been able to recommend the election of two men, although there were several candidates, and three widows of pensioners had been placed on the pension list. The number of deaths of pensioners had been eight, the total number now on the funds being twenty-eight men and thirty-five women. The committee offered their grateful thanks to the president, Mr. H. H. Bartlett, for the kind interest he had shown for the prosperity of the institution, and with great satisfaction announced that Mr. J. Howard Colls would be the president for the ensuing year. The annual dinner would be held, with the consent of the Court of the Worshipful Company of Carpenters, at their Hall, on November 29 next. The report and accounts were adopted on the motion of Mr. George Plucknett, J.P., seconded by Mr. T. Stirling. Votes of thanks were passed to the president for the past year, Mr. H. H. Bartlett; to the vice-presidents, to the trustees, and to Mr. Plucknett, the treasurer, who was re-elected. Votes of thanks were also passed to the committee, the retiring members being re-elected, with the addition of Messrs. W. Brass and G. Wall; and to Messrs. Ward, Duffield, and Bolding, the auditors. The chairman proposed, as president for the ensuing year, Mr. J. Howard Colls, who, he believed, would do his utmost to further the interests of the institution. The resolution was unanimously agreed to, and, with a vote of thanks to the chairman, the meeting separated.

## LIABILITY FOR SUBSIDENCE OF LAND.

THE case of *Homer v. Hanley and Buckland Colliery Company* came before Mr. Justice Denman and a special jury at the Staffordshire Assizes on Saturday. Mr. Jelf, Q.C., and Mr. Rose appeared for the plaintiff; and Mr. H. D. Greene, Q.C., and Mr. A. Young for the defendants. The plaintiff, Mr. C. J. Homer, is a mining engineer, and a director of the Hanley Colliery Company. In 1873 he purchased the Ivy House estate at Hanley for 47,000*l.* as a building estate; but he alleges that in consequence of the subsidence caused by the defendant company's mining operations, the value of the land had been seriously diminished for this purpose. One of the defendant company's collieries—the Holly Lane—came up to the edge of plaintiff's estate, and another—the Cock's Head—to within 50 yards of it. The evidence for the plaintiff was that within the last two or three years the plaintiff's land had subsided to the extent of three or four feet, and the subsidences were all in the direction of the defendant company's workings. Various professional witnesses attributed the damage to these workings, and put the damage at about 1,300*l.* Plaintiff stated that the Hanley Colliery Company, to which he belonged, and to whom he had leased the mining rights under his land, had not worked the mines to a sufficient extent to cause subsidence, and had left off working in order that there might be a sufficient support left. He considered that the subsidence was due to the neglect of the defendant company to leave proper ribs and barriers, and he estimated the damage at the least at 2,000*l.* The case for the plaintiff closed on Saturday. —For the defence, a number of mining engineers and land surveyors were called to state that the subsidence was due at least as much to the workings of the Hanley Company as to those of the defendants.—Mr. Strickland, vice-president of the Society of Mining Engineers, and formerly colliery manager to Earl Granville, was one of those who gave evidence to this effect, and he stated also that the damage was considerably below the amount the defendants had paid into court. Apart from the mining operations, he did not consider the plaintiff's land eligible as a building estate.—Mr. James Lee Space, surveyor, of Oldham, said that the land was not suitable for building, because, being between the river Trent and a feeder, it was damp and liable to floods.—Mr. Jelf: But is not a river considered an advantage in selecting a site for a house?—Witness: Not such a river as that.—But surely you are not going to say anything against our Trent. It is a very

nice river, isn't it?—It is a very nasty river at times.—Witnesses who had worked in the mines stated that there had been breakings in of water from above sufficient to cause what subsidence had taken place. It was also stated by residents in the neighbourhood that the recreation ground and race-track and the roads near the plaintiff's estate had not had to be raised within the last twelve years.—Mr. Greene, Q.C., having summed up the defendants' case, Mr. Jelf replied, and his lordship summed up, asking the jury to decide first of all whether they considered any damage at all had been caused by the defendants. The jury found that some damage had been caused. His lordship then summed up the evidence as to the amount of damage, and explained to the jury that they were not necessarily bound to give 200*l.* because the defendants had paid that sum into court. This might have been done to avoid the costs of the action.—The jury found for the plaintiff, damages 120*l.* more than the amount paid into court, making 320*l.* in all. An injunction to restrain defendants from further damage was granted.

## REMINISCENCES OF A CONTRACTOR.

AN account of an interview with Mr. S. W. Pilling, of Bolton, railway contractor, is given by the *Bolton Chronicle*, in the course of which Mr. Pilling referred to his father, Mr. Abraham Pilling, who was a member of the Bolton Corporation for twelve years up till 1874. He resides at present in Southport, where he is a member of the Town Council and chairman of the Finance Committee. His son stated that the ex-alderman laid in 1845, or thereabouts, the foundations of the railway business now under Mr. S. W. Pilling's control, adding:—"My father hailed originally from Huddersfield—he was born at the village of Lindley, near there—but settled in Bolton in 1843, as contractor's agent on the Bolton and Blackburn Railway (then in course of construction). In 1845 he launched into business on his own account. Being a Yorkshireman, and, as most Yorkshiremen are, a man of grit, he soon made his mark. At first his operations were confined to the erection of public buildings—churches, offices, and the like—but his *forte* lying in railway and river works, he gradually laid himself out for that business."

"What particular lines did he construct?"

"Well, there was, just speaking from memory, the Boar's Head and Adlington section of the North Union Railway; a branch at Sutton Oak, St. Helens; the Bolton and Worsley

# Wilson's Patent Dioptrical Pavement Lights.

WILSON & CO. beg to call the attention of Architects and others to the superiority of Wilson's Patent Dioptrical Lenses for pavement and floor lights. These Lenses are constructed on strictly scientific principles, and have been approved by some of the highest authorities on light. They are made of the Best English White Flint Glass of high refractive power, and transmit more light than any other form of lens yet introduced. The reflecting surface being spherical, the rays of light are distributed in every direction.

Wilson's Patent Lenses for Floor Lights, Deck Lights, and Pavement Lights of every description. Sample Lenses on application.

Wilson's Patent Lenses for Stall Boards, Cellar Flaps, Ornamental Tile & Glass Pavements. Safety Coal-Plates. Plans, Prices and Estimates Free.

Fig. 1 shows how the ordinary prism or semi-prism, by receiving the rays on a plane reflecting surface, throws them forward at one angle only, in parallel lines close to the ceiling.

Fig. 2 represents the Patent Dioptrical Lens, and shows by comparison how the rays of light, striking on the curved inner surface, are reflected forward through the face of the lens in every direction, filling the whole angle of 90°, thus illuminating the apartment from floor to ceiling and from wall to wall.

From the above diagram it will be seen wherein consists the advantages claimed for Wilson's Patent Lenses. The objection to the semi-prism is that it reflects the light, as shown in Fig. 1, at such an angle as to be of little use, and more especially if the line of the ceiling is low the line of the pavement; then the value of the semi-prism as a light projector is entirely lost.

It will be seen also, on reference to the above diagrams, in Fig. 1 that the first row of semi-prisms obstructs the rays of light from each succeeding row, whereas in Fig. 2 the bulk of the rays of light are projected at such angles as to pass unobstructed into the room.

The correctness of these illustrations can be practically demonstrated to any architect desirous of testing them.

PRICE LISTS AND ESTIMATES ON APPLICATION TO

WILSON & CO., Bridge House, 181 Queen Victoria Street, London, E.C.

line, with stations and goods depôts, on the London and North-Western Railway; the Astley Bridge branches on the London and Yorkshire system, with other works, such as bridges, and widening of line, and for the same company; the Ayrshire and Wigtownshire Railways, in the south-west of Scotland, thirty-five miles; all this was previous to the year 1877, when I joined my father in business."

"What age were you at that time, Mr. Pilling?"

"I was born in 1856, consequently I was just twenty-one years old. My birthplace was Bolton-le-Moors. When nine years of age I was sent to Southport, to the well-known school, Bickerton House, Birkdale, and remained there as a pupil of Mr. Mathwin's for six years, and this was a happy period of my life. Not only were our studies considered an important part of a boy's education, but our respected master insisted upon proper outdoor exercise such as cricket, football, boating and the like."

"You had a pretty stiff dose of schooling then?"

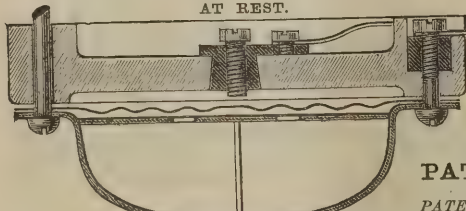

"Oh! but I hadn't finished when I left Bickerton House, for I was straightway despatched to Manchester to attend classes at Owens College. Then, having acquired there something of the theory of railway engineering, I was sent, as an articled clerk, to learn the practice of it on the Ayrshire and Wigtownshire Railways; and, finally, I landed in the office of Mr. George Woodhouse, architect, Bolton, with the object of picking up all I could about the construction of buildings. I had splendid opportunities while with Mr. Woodhouse. That gentleman was, I may say, at the head of his profession in Bolton. He designed the fine town hall and gas offices there, and satisfactorily carried through their erection. He was also architect of numerous mills and chapels in and around that busy B. Singularly enough Mr. Woodhouse and my father were natives of the same village near Huddersfield, and had been boys together there."

After an incidental reference to his father, while serving in the Bolton Town Council, having "filled the important office of chairman of the Sewage Works Committee at a time when the application of science to the system of sewerage was just coming into play, in the discharge of the duties of which office his practical knowledge of course stood him in good stead," Mr. Pilling informed his interviewer that while he was in partnership with his father from 1877 to 1880—in which last-mentioned year the latter retired into private life—the firm constructed "the Salford Corporation outfall sewage works, at Mode Wheel, costing about 60,000*l.*; also several sections of

the intercepting sewers connected with the same borough; the Wallasey new bridge over the Irwell, costing about 25,000*l.*; the Cromwell new bridge, costing about 12,000*l.*; the Springfield Lane, costing about 15,000*l.*; and the laying of tramways in connection with the Astley Bridge section of the Bolton and Suburban system. Previously to my joining my father he had constructed eight other bridges over the river Irwell, including Trafford Bridge, Palatine Bridge, Agecroft Bridge, Ringley Bridge, &c. Since my father's retirement I have constructed Baldwin's Bridge, which connects Eton with Windsor; the three-arched bridge which spans the Ouse at Bedford, visible from the Midland Railway; Farnworth Bridge, near Bolton; and an aqueduct over the Ribble for the Blackburn Corporation. In Bolton I have been entrusted with the building of gasworks, viaducts, and tram lines; in Leicester I built the 'flood works,' which cost nearly 60,000*l.*; in Huddersfield I laid 14 miles of tram lines. It was while engaged on the last-named work that I resolved to let my house near Bolton and reside at Mirfield, taking a temporary residence until my present abode, 'Crow Lees,' became at liberty. In 1879 I was married to the daughter of Mr. Marmaduke Fox, of Marmaville, Mirfield."

The conversation turning next to Mr. Pilling's connection with his favourite hobby of music and organ-playing, he described the private organ he has at home as an instrument 25 feet high, 20 feet wide, and 16 feet deep, and blown by hydraulic engines, the pressure travelling a distance of 60 feet. It has four manuals and fifty-two stops. The "solo organ" is on 8-inch wind pressure, and the latest improvement of tubular pneumatic action has lately been applied by the builders, Messrs. Brindley & Foster, of Sheffield. Mr. Pilling added that since the year 1875 he had drawn the specifications of, and had opened—that is, played at the inaugural ceremonies of—some seventy-two new organs in different churches and chapels throughout the country, he having made a complete study of the organ, both inside and out. "I have," he continued, "played at these inaugural services as an amateur only—that is, without fee or emolument, for I have ever been jealous of trespassing on the preserves of the paid organists. For example, I at present hold an honorary Sunday appointment in a town three miles from my home. The church possesses an exceptionally good organ; and, conditionally upon my acceptance of the position, the congregation still retain the services of their professional and venerable organist, who receives upwards of 50*l.* yearly, and according to my arrangement will do so as long as I have the direction of the musical services of the church."

of Designs on application.

## REGISTRATION OF PLUMBERS.

At the City and Guilds Institute, Finsbury, on Monday, an examination was held, under the auspices of the Worshipful Company of Plumbers, for certificates of registration. The practical examination included various branches of leadwork, and the theoretical questions relating to the several subjects of plumbers' materials, house fittings, and sanitation. Plumbers attended from Fordingbridge, Exeter, Tunbridge Wells, Ryde, Bicester, Margate, and various districts of London. The examiners were Mr. Charles Hudson, assistant chairman of the registration committee, and Messrs. Ashdown, Davis, Lobb, Lyne, Millis, Smeaton, Taylor, and Webb. Rather less than 50 per cent. of those attending passed the full examination.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

## APPLICATIONS FOR PATENTS.

10492. Charles Scott Snell, for "Improvements in holders for incandescent electric lamps." July 20, 1888.  
 10515. John V. Auth, for "An improvement in window-glass setting." (Complete specification.) July 20, 1888.  
 10544. Frederick Sawyer Winsor, for "Improvements in flushing tanks or cisterns." July 20, 1888.  
 10550. John Pullar, for "Improved safety lock fast gear for actuating fanlights." July 21, 1888.  
 10578. Anthony Dunderdale, for "Improvements in collapsible or folding shutters, window guards, sunshades, gates, balconies, and the like." July 21, 1888.  
 10610. Joseph Kaye, for "Improvements in locks." July 23, 1888.  
 10673. Richard Wright, for "Self-locking window-sash fastener." July 24, 1888.  
 10678. Richard Smith Casson and Benjamin Talbot, jun., for "Improved gas-furnace." July 24, 1888.  
 10706. George Evans, for "Improvements in construction of window frames and hanging the sashes." July 24, 1888.

10742. George Stubbs, for "Improvements in the construction of gas-cocks." July 25, 1888.  
 10756. Alfred Butterworth, for "A shadowless gas globe." July 25, 1888.  
 10757. Friedrich Wendling, for "A new paint for stone, plaster, and the like." July 25, 1888.  
 10770. Henry Lee Hind, for "Improved door fastener." July 25, 1888.  
 10789. William Thomas Wright (trading as Wright & Davies), for "Improvements in drinking flasks." (Complete specification.) July 25, 1888.  
 10791. John Partridge, for "Improvements in roller-blind fittings, which he entitles 'The roller blind fixing and cover lath.'" July 25, 1888.  
 10798. George Drinkall Jefferson, for "Improvements in ovens for domestic and other purposes." July 26, 1888.  
 10801. Gilbert Henry Garrett, of Robert Stephenson & Co., Limited, for "Improvements in traps for sanitary and other purposes." July 26, 1888.  
 10842. William Davies, for "Improvements in flushing apparatus more especially adapted for flushing urinals." July 26, 1888.

## PROVISIONAL SPECIFICATIONS ACCEPTED.

7618. William Ross, for "Improvements in bricks." May 24, 1888.  
 8963. William Sayer, for "Improvements in means and apparatus for manufacturing bricks, tiles, and the like." June 19, 1888.  
 9054. William Peyton, for "An improved chimney head or pot." June 21, 1888.  
 9343. Frederick Hodges, for "Improved means for mitreing mouldings and the like." June 26, 1888.  
 9388. Arthur Ramsden, for "Improvements in sewer and other pipe joints." June 27, 1888.  
 9591. Edward Thorp, for "Wind and water bars for meeting rails, top and bottom rails of sliding sashes, top rail and stiles of casement sashes, top rail and stiles of doors." July 2, 1888.  
 9760. Richard William Pyne, for "Improvements in fastenings for doors." July 4, 1888.  
 9761. James Stuart Palmer, for "Plastic wall decoration composition." July 5, 1888.  
 9816. Edgar Newton, for "Improvements in apparatus for actuating the lights or ventilators of horticultural buildings and the like." July 5, 1888.

In One Development and Washing.  
Best Medium for Reproducing PLANS  
from TRACINGS.

J. R. GOTZ,  
19 BUCKINGHAM ST., STRAND, LONDON.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

## TESTIMONIALS.

SIR.—I have much pleasure in testifying to the efficiency of your patent warm-air fire-grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c., JAMES WEIR, F.R.I.B.A.,  
6 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMPFIELD, M.A., Esq., Architect,  
28 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out his plan of warming in several churches built under my direction, and in each case it answers remarkably well, and has given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of commendation as to the apparatus you supplied for heating Derry Cathedral. Not only is the air of the Cathedral quite pure and pleasant to those attending the services, as it must be from the fact that most of the air heated is taken from the outside, but I find the building itself is so much benefited, as formerly it was damp and smelt damp, but now it is very dry and free from any musty smell. I find that, although the Cathedral is now much larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

Mr. John Grundy.

Apply to JOHN GRUNDY, 30 Duncan Terrace,  
City Road, London.

CORSHAM DOWN QUARRY (Entrance from Railway).

## BATH FREESTONES.

We are prepared, as heretofore, to supply these sound and fine Building Stones on terms advantageous to Buyers. Orders promptly executed, and Blocks selected to suit all requirements.

Prices quoted by return of post, and all letters to be addressed to

YOCKNEY & CO. (Sole Owners),

CORSHAM DOWN QUARRY,  
CORSHAM, WILTS.

Note.—No Connection with the other BATH  
STONE FIRMS.

10100. George Cope Dixon and Walter Pretyma, for "Improvements in safety sash or window fastenings." July 11, 1888.

10212. James Matthew Matthews and Frank Buckland, jun., for "Improvements in locks and fastenings for railway and other carriage doors, and for other purposes." July 13, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

12362. Proctor Barrett, for "Improvements in means applicable for the counterbalancing of window sashes." September 13, 1888.

12817. Maximilian William Henry Clarke, for "Improvements in fireproof curtains for theatres, music-halls, and similar buildings." September 21, 1887.

12872. Mark Henry Blanchard (trading as M. H. Blanchard & Co.), for "Improvements in bricks for wells, and such like purposes." September 22, 1888.

17061. Deborah Jane Procter, for "Improvements in the construction of candle shades or reflectors, and in the means of attaching the same to candles." December 12, 1887.

3608. Harry John Burgess, for "Bib-taps." March 8, 1888.

8808. Henry Harris Lake, for "Improvements in metallic roofing-plates or shingles." June 15, 1888.

#### PATENTS SEALED, JULY 27, 1888.

9887. Jesse Rust, for "New and improved material for colouring paints, cements, and other substances." July 14, 1888.

13472. John Coppard, for "Improvements in the construction of appliances for closing or opening doors, windows, and other structures, for which such openings are used." October 5, 1887.

14422. George Frederick Newman, for "Improvements in door springs and checks." October 24, 1887.

4900. Henry Harris Lake, for "Improvements in weather strips for doors, windows, and the like." March 31, 1888.

5688. Horace Frederick Fuller, for "Improved means for facilitating etching in colours." April 17, 1888.

#### ABRIDGMENTS OF SPECIFICATIONS RECENTLY PUBLISHED.

"Improved apparatus for disinfecting water-closets, lavatories, and other similar purposes." No. 7602. 1888. W. L. Simmons & E. A. Simmons, 201 High Street, Stoke Newington. This is an ingenious invention, by means of which a limited quantity of disinfecting fluid can be discharged from a small tank into the pan of the water-closet or other similar article. A tube is hinged in the tank with a tap at its base, and this tube lies horizontally along the bottom of tank when at rest and the tap is shut off, and when the tube is raised by means of a lever to a vertical position the tap at base of tube is opened, and the disinfecting fluid contained in same is discharged through a pipe into the vessel required to be disinfected. A weighted lever compels the return of the tube to bottom of tank, where it refills for next action. The tube can be actuated by means of the pull-handle of the water-closet.

"A method of fixing wood linings and the like for walls and ceilings." No. 11,103. 1887. F. W. Jones, 210 Bute Road, Cardiff. A new method of fixing wood linings, such as door jambs, panelled dados, &c., more particularly useful for covering up sanitary work that requires occasional inspection, and consists of an iron flanged casting; one flange is built into wall, and other flange projects as required, and is tapped with screw holes to take screws that go through the framing.

"Improved mouthpiece for speaking-tubes." No. 194. 1888. W. Frazer, 6 Livery Street, Birmingham. The orifice of the mouthpiece is closed automatically after the same has been used or spoken through, and only one of the alarm whistles sounds, though both whistles remain in the body of the connection carrying the mouthpiece when the tube is blown through.

"Improvements in the manufacture, &c., of articles of a cylindrical form." No. 7635. 1888. G. R. Wilson, 1 Paul Street, Finsbury. This invention consists of applying corrugated metal whose section, taken at right angles to the direction in which the corrugations run, forms a regular and continuous curvilinear line, these corrugations being always in a vertical direction.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

A MEETING of the trustees of the "Alexander Thomson" Memorial was held in the Religious Institution Rooms, Glasgow, on Wednesday, the 1st inst., and Mr. DAVID THOMSON, president of the Glasgow Institute of Architects, occupied the chair. At this meeting Mr. WM. JAMES ANDERSON, who gained the architectural travelling studentship in December last, submitted the sketches which he had made during his tour in Italy, together with a manuscript descriptive memoir. The sketches, sixty-four in number, with nine sheets of measured drawings, were exhibited on the walls and carefully examined by the trustees, who felt extremely gratified with them, as evidence of Mr. ANDERSON'S diligence and industry while on his tour, and of the skill and ability which he has displayed. It is highly satisfactory to find that in this, the first competition for an architectural studentship in Scotland, such meritorious drawings were sent in by the candidates, and, now that the prizeman has made the tour, that he has performed the work required of him in this manner. It is gratifying to learn that, in the national competition at South Kensington, the silver medal has just been awarded for the drawings of the prizeman, and that the competitive drawings of two of the other candidates for the Alexander Thomson Studentship have also gained prizes at South Kensington.

THE funeral of the late Mr. FRANK HOLL, R.A., took place on Tuesday, in the cemetery at Highgate. Among the friends of the late artist assembled in St. Peter's Church, Belsize Park, and in the cemetery, were Sir Frederick Leighton, Sir John Millais, Messrs. Horsley, Goodall, Alma Tadema, Seymour Lucas, Brett, Hodgson, Storey, Burgess, Dicksee, Poynter, Phil Morris, Sant, Wells, Edwin Lucy, Henry Moore, Marcus Stone, Luke Fildes, Carl Haag, Gow, Dicksee, Du Maurier, Felix Moscheles, Clayton, Boehm, Onslow Ford, Riviere, Orchardson, Val Prinsep, Humphry Ward, Frith, Stacy Marks, Oules, Frank Dillon, and Thornycroft. The Council of the Royal Academy have decided that a principal feature of the next winter exhibition at Burlington House shall consist of a representative selection of the works of the late Mr. FRANK HOLL.

VISITORS to Mont St.-Michel this year will be able to inspect the new museum in the abbey, which is founded by the French Government with the aid of the Commission on Historic Monuments. It was opened last week. One of the features is a series of paintings illustrative of events in the history of the abbey. The French authorities now find it an advantage to make use of historical paintings in their buildings, and although there are great historians among the French, it is found that the painters are better able to aid the public to realise historic scenes. An opportunity is also given for works of a higher class than the everyday incidents which are the favourite subjects with most patrons. We might with advantage imitate our neighbours, for few buyers of pictures in England care much for historical subjects.

AN important Blue-book has been issued this week on the action of light on water-colours, which contains the report of Dr. RUSSELL and Captain ABNEY, or rather the first section of their report. These gentlemen take the opportunity of recording their thanks to the committee of artists for suggestions in course of the investigation and criticisms on various points of the report. The book contains nearly one hundred pages, and included are explanatory diagrams and plates. The report must be perused in its entirety to do it justice, and it will well repay the trouble. The controversy on the permanency of water-colours which took place lately was, it will be remembered, the primary cause of the inquiry which has been started, and which has been prosecuted with the most praiseworthy thoroughness. The second report, which has yet to appear, will deal with the chemical changes, but what has already appeared cannot fail to throw a most interesting light on many other points affecting pigments and their use, besides those points in dispute. Whether it will help Sir J. C. ROBINSON and Sir JAMES LINTON to come to some settle-

ment on the question of permanency of water-colours, or whether they may find in it proofs to support their own views remains to be seen. Broadly speaking, it would seem that damp or moisture is the great enemy to be guarded against. The spectroscopic investigation points to the blue rays of light being the chief agents for change, where change has occurred from light. This seems natural, as the same sort of thing is the case in photography, where the changes are effected, or, in other words, the picture produced, by the action of blue rays of light.

THERE is some dissatisfaction among the painters of Brussels who have sent works to the Triennial Exhibition of Antwerp. They maintain that the best places are occupied by Antwerpians, and, as there is jealousy between Antwerp and Brussels, it is not surprising that the painters of the capital declare they will not exhibit in the city on the Escaut. The triennial exhibitions are, in fact, an anomalous institution. If intended to display local art, they should not be made up of works which come from a distance. In Antwerp there are French and German pictures, as well as some from most towns in Belgium. As the exhibitors have become national and cosmopolitan rather than local, they should not be managed by a committee that must be inspired by local sympathies.

THE Society of Arts offer prizes to art workmen for the session 1888-89, in pottery, stone carving, wrought-iron work, and goldsmiths' and silversmiths' work. The prizes in the last class are presented by the Goldsmiths' Company, and are offered for a cup or sugar basin of beaten silver, chased or otherwise. First prize, 20*l.*; second prize, 5*l.* A pendant brooch or locket of gold without gems. First prize, 20*l.*; second prize, 5*l.* Nineteen prizes are offered in the class of pottery, four in the class of stone carving for the capital of a column, and three for a wrought-iron grille. All articles for competition must be sent in to the Society's house on or before Tuesday, April 23, 1889. The conditions under which these prizes are offered can be obtained on application to the secretary.

THE annual meeting of the Royal Scottish Arboricultural Society was held on Tuesday in Edinburgh. On the subject of forestry the chairman advised the planting of waste or unproductive lands with timber, mentioning that there were about twelve millions of acres, nearly all included in the large estates of the United Kingdom, the annual value of which did not exceed an average of 1*s.* 3*d.* an acre. Allowing a deduction of one-third for high altitudes of land unsuitable for the growth of forest trees, there still remained eight millions of acres of land which might be covered with forests to the mutual advantage of the owners and the benefit of the country. The total area now under woodlands in the United Kingdom was about 2,788,000 acres, the smallest proportion to the total acreage of the country that was to be found in any well-regulated European State.

THE students of the classes of sculpture in the Ecole des Beaux-Arts have been more fortunate than their brethren of the schools of painting, since the Prix de Rome has not been withheld. M. CONVERS, a pupil of MM. CAVELIER and AIMÉ MILLET, has gained that distinction. The model of M. THEUNISSEN was deemed worthy of the second prize, and M. H. LEFEBVRE gained the third. Both are students of M. CAVELIER, who has had consequently a share in the teaching of the principal prizemen. In the section of engraving M. HENRI LERICHE has gained the Prix de Rome, M. CHIQUET was placed second, and M. DETURCK third.

THE relations between Russia and France being for the time most friendly, the northern empire is likely to be better represented in the Exhibition of next year than most other nations. At present subscriptions are being raised in St. Petersburg for the purpose of constructing in the Champ de Mars a model on a very large scale of the cathedral church of St. Isaac, which is so dear to all Russians. It will be an expensive work. On the closure of the Exhibition the model will be presented to the City of Paris, and probably will find a permanent place in the collection of the Ecole des Beaux-Arts.

## MR. ROYLE'S ADDRESS.

THE address delivered by Mr. ROYLE to the Manchester architects, which we published last week, resembles most documents of the kind; that is to say, it is a summary of information which must have been familiar to all who were present at the delivery of the address. The president of the Manchester Society of Architects followed the pattern set up of late in Conduit Street, and took care to be safe by keeping to commonplaces. Mr. ROYLE is an architect of standing, but not even gratitude for attaining the presidential chair could draw out of him one fact which might be considered as a contribution to professional knowledge.

It is strange that an architect when he is about to compose an address of the kind will not turn to some other source of inspiration than the dull volumes of the Royal Institute of British Architects, which are most efficient aids to fill up the shelves of a bookcase and keep useful books erect. A glance at the reports of proceedings in other professions would suggest more profitable models. The president of a medical society in the provinces, as in London, will always be found to select a subject which he endeavours to elucidate with the aid of his own knowledge and experience. It is felt to be incumbent that the head of a society should make it plain that he was competent for better duties than talking on things in general. Let us see how Mr. ROYLE endeavoured to enlighten the members who are under his authority for a year or more.

Mr. ROYLE began with the architectural division of last year's Exhibition in Manchester. That is a subject which should make every member of the Manchester Society of Architects ashamed of himself, for since exhibitions began there was not one more unfair in the arrangements or more unsuccessful in results. Mr. ROYLE admits that "probably no section of the Manchester Exhibition was less seen or less carefully examined than the Architectural Court—a fact which perhaps accounts for the very little attention it received from the general newspaper press." We may take some credit for that neglect, for we were the first to expose the pretensions of the collectors, and whenever we see an absence of fair play in the arrangements of an exhibition we shall be equally outspoken. Mr. ROYLE confesses that the number of drawings representative of Manchester and its suburbs was disproportionate, if he took account of the buildings erected elsewhere by Manchester architects which were represented. The President might use a still stronger term. He says that "if the historic idea had been more closely kept in view the display might have been more adequate." But he has not the courage to say why that idea was set aside in an Exhibition which professed to be historical. The architectural section was in truth of a mongrel kind; it was not complete from any point of view, there was a good deal of selfishness about it, and we must congratulate the factory operatives and other sightseers who showed their sense of justice by repressing their curiosity. When the part of the building near the great organ was assigned to architecture, there was much trumpeting about the diplomatic victory of the Manchester Society of Architects, but now the President considers that the place was "unfortunately situated." As well as we recollect the architectural section was capitally placed. There were no paintings or manufactures to disturb the vision. With prudent management the walls could have been made attractive, and there is no use now in attributing the failure to any other cause except the action of the Society and its representatives.

Mr. ROYLE wisely avoids giving any criticism of the Architectural Exhibition, and says it is no part of his duty "to draw any conclusions as to its general character or to attempt to estimate its quality." But under other circumstances a criticism of the works should be the principal subject of his presidential address. Exhibitors who are living did not gain any benefit by having their buildings exhibited at Manchester, and they had a right to expect at least some assessment of the merit of their works, but Mr. ROYLE could not be frank in judging the collection unless he said much that would be disagreeable to some of his hearers. The President had a most desirable opportunity to treat of modern architecture, but apparently he dared not

take advantage of it. He must have felt that too little cannot be said about the only fiasco which stains the history of the Jubilee Exhibition. The wonder is that the majority of the Society do not repudiate every attempt to connect them with last year's mismanagement.

After the flagrant failure of the Society to realise the idea of the Exhibition, and their inability to cover two walls in a satisfactory style, no one need wonder at the hesitation of the City Council (some of whom were members of the Exhibition Council) to make use of the aid of the Manchester architects in remodelling the by-laws. "The municipal authorities," says Mr. ROYLE, "have not availed themselves of our offer of assistance during the process of revision." All that is asked of the Society is to become a sort of proof-reader for technical terms, in order, as one of the aldermen said, "to insure something like accuracy in the description of the various parts of buildings"! To that position NEMESIS has brought down the Manchester architects in consequence of their desire to turn the Jubilee Exhibition into an advertisement. The disesteem of the City Council can, however, be carried too far. Although there was an effort last year to monopolise the greater part of the walls, it does not follow that the architects who were so moved are incompetent to give suggestions about by-laws for building. It is, of course, hard to forget that the Exhibition would have been an entire success if the architects had had no share in the arrangements, but in that case they were undertaking novel duties which entailed self-sacrifice, whereas all their experience is of a kind that could be utilised by the Council with advantage to the citizens of Manchester. We therefore advise the City Council to ignore the mistakes of the Exhibition. But, on the other hand, the Manchester Society should make it plain that they have more self-respect than was shown by the Royal Institute of British Architects in respect to Northumberland Avenue, and will not submit to snubbing for the sake of recognition. Why should the proof-reading be undertaken, if that work is the limit of the Council's confidence? Although the Society may be under a cloud since last year, it must still have sufficient power to resist any attempt to make it a tool or a convenience.

In a competition with business or money-making, art must never expect to take a foremost place. What is the use of talking about the effect of telegraph wires upon the sky-lines of an architect's composition? It is in vain to expect that the Manchester merchants will remove conveniences which have become like parts of themselves because they do not aid in producing architectural effect. Let Mr. ROYLE and his fellow-members devise a way of having telegraphic communication with invisible or concealed means, and then it will be reasonable to seek an alteration of the present system. Nor is much gained by describing the erection of "chimney funnels on bases of red bricks" upon a stone building as "a monstrous abortion," an "outrage" and an "enormity," when it is likely that in a short time the new and the old work will differ but little in colour. Repose is as needed in writing as in building, and there is not much likelihood that the people of Manchester will be converted to a sense of the beautiful through the power of annoying adjectives.

We hope a prosperous time for the architects of Manchester will follow the completion of the great canal. But they may be assured that if impediments of an æsthetic sort are raised against the requirements of men of business, engineers, builders, and others will be forthcoming to take their places. One of the misfortunes of our time is the prejudice against architects on account of their supposed indifference to all considerations except the picturesque appearance of a building, and when we find men of the rank of Mr. ROYLE objecting to architects being "tied down by the false ideas of owners and tenants," or, in other words, suiting the requirements of the men who give the commissions, we must think that common sense is needed in Manchester on other matters besides the arrangement of an exhibition. Would it not also be wiser to suppose that there must be some more reasonable cause for the great warehouses being found in Manchester—in Salford rather—than "prejudice, sentiment, or force of association," which are Mr. ROYLE's assumed causes? The owners of such buildings are hard-headed, and are not likely to be the slaves of sentiment. But we must agree with Mr. ROYLE

that it would be a good work to raise the character of Salford, to cover the Irwell in the city, and to make an open space near the Exchange Station that would be creditable to Manchester.

Mr. ROYLE, it will be found, has much to say about the future condition of the Institute, and he is so sanguine and imaginative as to suppose that it "is the duty now of all properly qualified architects to connect themselves with the Institute, as the profession generally will thereby gain very much in the estimation of the public." We fancy Mr. ROYLE must be so absorbed by his duties as to be unable to mix much in society, or he would have known that the British public cares less about the Institute than any other body of men. Let him ask a few of the merchants or manufacturers about the Institute, and he will be surprised at the deficiency of their knowledge on the subject. After fifty years of continuous failure, what else is to be expected? Yet, strange to say, Mr. ROYLE can offer no other inducement than "the estimation of the public" to the architects who have not yet had their names enrolled in Conduit Street. He supposes there will be a broader basis, an attention to the views of provincial members, an uniform set of regulations throughout the country, and so on, but the great thing is the "estimation of the public." One might suppose that people who have commissions to give have the list of the members of the Institute before them, and seek out every new addition with fervour. Allowance may be made for collegians who think that political readers watch their mimic debates, and are ready to seize upon whoever holds his own, but for grown men to be under the illusion that the public will change disesteem into esteem if they join the Institute is absurd.

We are quite sure Mr. ROYLE could have composed a far better address if he had trusted to himself. But evidently he had before him a speech by one of the itinerant agitators of the Institute, and felt in duty bound that he must repeat the conventional phrases about the liberal and friendly spirit, the access to rooms and library, the increase of power to provincial societies, which are known wherever architects congregate. Twenty years hence the president of the Manchester Society may be expected to talk in a similar strain, and with as little evidence of any advantage to the members from their association with the Institute. Then, as now, the benefits may be expected to be of a prospective kind, and as far from realisation as they are at present.

#### CANTERBURY CATHEDRAL.

THE committee appointed to make an antiquarian investigation in Canterbury Cathedral have just presented their report. This investigation took place owing to remains having been found which it will be remembered were thought might have been those of St. Thomas à Becket. The document states that explorations in the crypt would tend to show that the lower portion of the west wall must have been part of the pre-Norman crypt, and the character of the plaster seems to suggest the possibility that it formed part of the original building granted to St. Augustine. Eastward of the lady chapel the furthest extremity of Ernulph's crypt has been traced, terminating in a rectangular chapel. Between the west face of the wall of the rectangular chapel and the next vaulting shaft a hollow, extending about 3 feet below the surface, and filled in with rubble, seemed to indicate what was the position of Becket's coffin from 1170 to 1220. Near by the explorers discovered two long steps of Purbeck marble, originally, no doubt, the steps of approach to the altar of the tomb of the martyred Archbishop. About 4 feet west of the lower step, in a direct line with the central shafts, was found the narrow end of a stone coffin, 6 feet 2 inches long. It was hewn from a solid block of Portland oolite, and was covered with a thin slab of Merstham or Reigate freestone, utterly unfitted for such a purpose. The earthen floor was full of large fragments of wrought masonry which had formed small arches, elaborately moulded in Early English style (*circa* 1220-1230). Small round shafts and bases, and other fragments of Norman arches were also found. The head and base of a bishop's or archbishop's effigy beneath a canopy were found in the same place. They are sculptured in Purbeck marble in high relief. An early floor of white plaster was traced about 6 inches below the present level. This part of the crypt was walled off and made a private cellar (A.D. 1546), being appropriated to Richard Thornden, second bishop of Dover, under the name of "the vault called Becket's Tomb," so that the moulded masonry in the floor must have been placed there before 1546. The stone

coffin contained human bones, gathered together towards the middle and upper portion of the coffin, and mingled with earthen *débris*. At the head was a boulder-stone hollowed as if to form a pillow. It had been broken across the middle. The remainder of the report deals with the question of identity, of which no distinct evidence is forthcoming.

#### WESTMINSTER ABBEY.

A VISIT has been made on the invitation of Canon Westcott to Westminster Abbey, by members of the Oxford Diocesan Church History Society, from the Wokingham district, in connection with the period of church history selected for investigation during the present year, a period that includes the reigns of Henry III., the three Edwards, and Richard II. A preliminary meeting had been held at Wokingham, in which the Rev. A. Carr, vicar of St. Sebastian, Wokingham, spoke of some of the leading points to which attention should be drawn in view of the proposed visit, and in preparation for Canon Westcott's notes on the history and architectural features of the abbey. The greater part of the existing church was built in the reigns mentioned above. It was indicated as a point of interest and full of teaching that the addition of six bays made under Henry V. by the famous Richard Whittington, while retaining the essential features and proportion of the thirteenth-century work, introduced fifteenth-century details which marked the epoch of the change. The break in uniformity made by Henry VII.'s chapel was shown to be significant of the historic break of that time, when a new era began for English history. The visitors first examined the monuments before that period, and next Henry VII.'s chapel. The variety of workmanship in the monuments of the earlier period was pointed out by Dr. Westcott—Limoges enamel admirably preserved in places, as on the shield of William de Valence—fragments of delicate wood-carving—the metalwork on the effigies of the kings—the sculptured work on the tombs, especially on that of the Countess Aveline, wife of Edmund Crouchback—and the still beautiful mosaics in the sacrum brought from Rome in the thirteenth century. The visitors were able to look down from Henry V.'s chantry on to the iron-barred chest containing the body of Edward the Confessor in the shrine below. The chapter-house was also visited, in which for nearly three centuries the House of Commons sat, and in which were passed the Acts which formed the Reformation Settlement.

#### PETERBOROUGH CATHEDRAL.

IN the course of the excavations necessary for underpinning the interior of the north transept of Peterborough Cathedral, an interesting discovery has been made, of which the Dean of Peterborough gives the following account in the *Times* :—

Close to the western wall of the transept the workmen came upon a richly ornamented Saxon slab, covering a grave, and evidently still lying in its original position. It is of the date, no doubt, of the second Saxon church—that in which Hereward was knighted—of which considerable remains were discovered a short time since after taking down and rebuilding the central tower. The slab must mark the grave of a layman, for the burying-place of the monks was on the south side of the building, where a Saxon cloister may have stood, just as the Norman cloister did afterwards. As the slab extended slightly beyond the space required for the excavated trenches to receive the shallow foundations of the present Norman structure, the workmen of that period destroyed a few inches of its length at the top. This, with a crack across near the foot, caused by the settlement of the earth consequent on the Norman excavation, is the only injury the slab has sustained, if we except the possible removal of an ornamented upright cross at the head; the rude footstone is still in its place. The surface of the slab is about 1 foot 6 inches below the level of the late floor, which, in its turn, was about 5 inches above the Norman floor. The length of the slab remaining is about 5 feet 3 inches, with a top width of 1 foot 10½ inches, and a bottom of 1 foot 6 inches.

The surface is completely covered with the richest Saxon interlacing ornament, forming a design of a central band of ornament about 5 inches wide, crossed at right angles by rather wider strips of ornament. Three of these are uninjured; the fourth, at the top, was almost entirely destroyed, as I have already said, when the present transept was built by William de Waterville. The design was originally, therefore, a fourfold cross. Each of these crosses is outlined with a double roll border, the inner one being twisted work. There is thus left between the borders of the cross arms three oblong spaces on each side between the broad central strip and the outer edge of the slab. Three of these are filled in with finer interlacing work, two with star crosses, and one is plain, having been left unfinished.

The slab is probably the most beautiful specimen of Saxon ornamental work of the kind that has come to light.

Some antiquarians who have seen it tell me that they have seen none finer. We have decided to raise the slab, carefully keeping it on its present site, so that it may still mark the resting-place that it originally covered, but in such a way that it will be above the level of the new floor and properly guarded from injury. It was found close beside the spot where rest the remains of Bishop Dove, Queen Elizabeth's "Dove with silver wings." If any representatives of the good bishop's family still exist, they may perhaps be induced to erect a monument to his memory in place of the one which was destroyed by Cromwell's soldiers, and bearing the same inscription.

Portions of other Saxon slabs have also been discovered not far from the one I have described, of similar design but of less elaborate workmanship; also a fragment of what was probably the raised monument of a Saxon abbot, originally standing in the church, the foundations of which have been lately exposed. Of this (Hereward's church, as I have said) we can trace the outline to a considerable extent. The lines of the transept and the choir can be followed in the south transept under the lantern, and in the nave of the present cathedral, but the nave of the Saxon church lay outside the present building. Measurements carefully made show that the present Norman cathedral is exactly double the size of the Saxon church, just as the Jewish temple was double the size of the tabernacle.

### WYBUNBURY CHURCH.

A PAPER was read by Mr. Charles Lynam on occasion of the excursion of the North Staffordshire Field Naturalists' and Archæological Society.

The church, he said, as approached from the east, has an imposing effect, due to its unusual size and the great tower, and being situated at the top of a hill, but on nearing the building it is soon seen that the whole of the body of the church is of modern date and of the poorest type, the provision for large interior galleries necessarily destroying all chance of a Gothic effect. This church was erected by Mr. James Trubshaw in 1836, only a few years after the parish church of Stoke-upon-Trent was erected under the same direction, and the same sort of character prevails in the two buildings, excepting that at Wybunbury there are arcades to the nave and a clerestory more after the fashion of St. James's, Longton. Mr. James Trubshaw must have had a heart totally indifferent to the merits of Mediæval art, or he could not have levelled to the ground such interesting structures as the ancient fanes of St. Peter's at Stoke and St. Chad's at Wybunbury. On a brass plate in the vestry is an inscription recording the dilapidated condition of the former fabric, but too truly "history repeats itself," and at this moment the proud achievement of James Trubshaw is now a fractured and in some parts a falling fabric, and needs another Trubshaw to set it right. More than fifty years have passed since this great galleried church was placed upon the earth; but even this length of time has not added a single feature of interest to it. Its main characteristic was meant to be according to the spirit of the times—a great preaching-house, and there it remains as such, and will do so as long as the running sand beneath it allows it.

In contrast to this modern effort there still stands the fifteenth-century tower, a great and an artistic work. But let the said James Trubshaw be thanked, for by his scientific skill this ancient part of the church was saved from falling. On the same vestry brass it is also written that this tower had declined from the perpendicular no less than 5 feet 6 inches, but he brought it again to its horizontal level, and so it is preserved to us to this day. The upper storey is of modern work, and belongs to the class of design to be seen at Acton, near Nantwich, and at Eccleshall. The three lower storeys are of ancient work, and the western front to this height is a truly noble composition, architectural and sculptural. At the angles for the first stage are massive square buttresses, as at St. Michael's, Macclesfield; on these are placed angular buttresses, giving variety of outline and lightness of effect. In the centre is a deeply recessed doorway, with a pointed arch and outer square head. On each side is a niched figure of a bishop, fully vested. The drapery in that to the north is treated in a straight-lined manner, and that to the south in a wavy form. This stage is divided from that above it by a bold and battlemented cornice. In the next stage as the central feature is a three-light window, with bold mouldings to the jambs and arch, but the original tracery has been substituted by plain curved continuation of the mullions, so that the rich effect of the original tracery is felt to be wanted. On each side of this window is a niched figure. That to the north a winged angel, and that to the south a female saint. The heads of both figures are modern, and very much spoil the figures themselves. In the centre of the next stage is a lofty niche, containing a fine seated figure of the Holy Father, with a strangely attenuated representation of the crucified Son in the front. In all there are these five niched figures in this west

front of the tower, with the central doorway and deeply-recessed window over it, bold buttresses, base moulds, and cornices; few church towers can be named which show such excellence of design, and having the advantage of enrichment of figure sculpture of fine Mediæval character. Originally this tower stood central in the west end of the church and it had a groined roof, the shafts and wall ribs of which still remain. Next the church was a fine arch, of which the side next the tower is still to be seen, but it is now walled up and its eastern face is external, the modern church being placed altogether south of the tower. Formerly this tower formed the main entrance to the church, and its doorway and window above it were seen within the church itself. The stair turret is at the north-west angle, and inside it has a doorway formed in a splay across the north and west walls. This splay prevented the use of groin shafts, as in the other three angles, and the instinctive ingenuity with which this irregularity was overcome is still deserving of observation by the architectural student. The lower storey is now used as a passage to the stair turret and a vestry, in which are preserved the plans signed by Mr. Trubshaw, and drawn with the utmost neatness and care. They are worth preserving as specimens of the draughtsman's skill at the time.

The inscription on the brass plate in the south wall of the tower is as follows:—"The tower of this church having, in the course of several centuries declined from its perpendicular 5 feet 7 inches, was restored to its present position in the years 1832 and 1833 by Mr. James Trubshaw, architect and engineer, of Haywood, near by Rugeley. The body of the church being in decay and falling by reason of a separation of the ground on which it stood was taken down at the same time and built ten yards from its former situation, under the direction of the said Mr. James Trubshaw. F. Mucklestan, D.D., vicar; James Hayes, curate; Robert Green Hill, John Whittingham, churchwardens." There are six bells in the belfry, which have on them the following inscriptions:—"These bells were cast at Gloster, 1791;" "John Rudhall, of Gloster, fecit, 1791;" "The Rev. John Swinnerton, vicar, 1791;" "When you us ring, we'll sweetly sing," "I to the church the living call and to the grave do summon all 1791," "Thomas Brockley and T. W. Perry, churchwardens." There is a striking peculiarity in the lettering of the last inscription, which is engraved and not raised, as is almost universally the case. The plans in the vestry distinguish the "free seats" from those appropriated or "to let," and it is noticeable that the former are very near the doors. The allowance per sitting is 18 inches for adults and 14 inches for children, and the total accommodation figures as for 1,642. The parish clerk shows an engraving of the old church presented to the parishioners of Wybunbury by Mr. John Twemlow, by whom the drawing was made in 1760, and engraved by E. Staller, of London, and published in 1836. The earliest register now preserved in the tower commences with the date November 1558, and the initial letter A would appear to be a reproduction very nicely drawn from some Celtic manuscript. It is characterised by figures of griffins and knotted forms; the writing generally is extremely good, and the books are in excellent preservation. The lines of the tower arch and of the original nave roof are still visible on the eastern face. The two lower stages measure on the outside 14 feet 7 inches north and south, and 15 feet 7 inches east and west; the third storey 15 feet 2 inches north and south, and 15 feet 7 inches east and west. There is a boldly projecting corbel table carrying the bell framing. The walls are about 4 feet 6 inches in thickness. The masonry of the tower is well built, in the manner characteristic of its period. The architect irresistibly lingers about its base, and leaves it with regrets that his eyes had not seen it as the central feature of an ancient church, with its original upper storey, and forming a magnificent porch to a corresponding interior. Turning from the tower to what remains of the former building, the font is first to be noticed, which is perhaps of the same date as the tower; it is octagonal in form, the bowl work into sunk panels and battlemented at the top. The four panels seen from the west have shields in them finished with coats-of-arms. The work has suffered somewhat from modern "improvement." Next is a fine brass to "Rafe Delvys and his wife," now fixed to the wall of the north aisle. It consists of figures of the knight and his lady, with the matrix of what appears to have been three children by the side of the lady, and two coats-of-arms, and the outline of two more. The inscription runs as follows:—"Here lyth Rafe Delvys of Doddington and Katernyn his wife the whyche Rafe died the third day Marche, in the yere of ower Lord God, A, mcccc. and xiv., on whose sowlyls Allmyghty Jhu have mercy." Lastly, there is on the north side of the chancel an elaborate alabaster canopied tomb within the sanctuary. It is a table tomb with effigies of Sir Thomas Smith and Dame Anne, his wife. In the front of the tomb are figures of the son and daughter, and beneath the canopy at the back the coat-of-arms and the following inscription:—"Here lieth Sir Thomas Smith, of Hough, Kt., and Dame Anne, his wife, daughter of Sir William Brereton, Kt., of Brereton, who had issue one son and one daughter, wch. Sr Thomas died the 21 of December, 1614, whose ladie in remembrance gave him

this monument." Both figures are for the most part in excellent preservation. The head of the knight rests on an elaborate crested helm: his hair is long and flowing, the face broad and full, with both beard and moustache: he is clothed in partial plate and armed with dagger and sword, and the feet rest on gloves or gauntlets. That of the lady is beautifully attired with ruff and very high stiff collar, and the dress is tucked up in a small roll immediately below the waist. The hands of both were uplifted, but are now wanting.

### ROYAL ARCHÆOLOGICAL INSTITUTE.

ON Tuesday the opening meeting of the Royal Archæological Institute of Great Britain and Ireland, now on a visit to Royal Leamington Spa, took place in the new Town Hall, Leamington. Amongst those present were Earl Percy (president of the Institute), Lord Leigh (president of the meeting), the Hon. Justice Pinkey, Major Lambitt, Mr. J. Brown, Q.C., Mr. T. H. Bayliss, Q.C., and a number of the local gentry, &c. Lord Percy, in formally opening the proceedings, expressed on behalf of the Institute the great thanks they felt to be due for the very kind reception the members had had on that occasion. They were looking forward to their stay in Warwickshire with feelings of very great interest. One of the principal features of these meetings was the opportunity afforded of constantly meeting with fresh and varied objects of interest. Last year they met in Wiltshire, where their attention was drawn to a totally different kind of archæology from what he supposed they would meet with in any other part of England. But, within the region of history, there was no part of England which bore more interesting traces of the great changes which had made England what she was like than the Midland Counties, and especially the county of Warwickshire. Here they could see the remains of the social life and political life of those who had contributed so largely to make England the great and flourishing country she was. As times of peace and war had gone over the country the struggles of the past had been marked by events with which Warwickshire and other places were closely connected. Therefore, all those who took an interest in history in its truest sense—the history which had made England what it was at present—would find on the present occasion ample objects to arrest their attention. In conclusion, Lord Percy referred to one or two subjects of congratulation and regret which attended this gathering. The subjects of congratulation were that they had had such a hearty reception, and had been able to secure so able a president as Lord Leigh. The matters for regret, the loss by death of four prominent and useful members, Mr. Morgan, Mr. Bloxam, Mr. Beresford-Hope, and Mr. Pullen. Those were four names which would always be held in affectionate remembrance.

Lord Leigh was then installed as president of the present meeting amid cheers. He mentioned that the Archæological Institute met at Warwick in 1864, on which occasion he had the honour, as now, of being the local president. He saw from the programme that they were about to pay a visit to Stratford-upon-Avon. Of late Warwickshire men had heard a great deal that had given them pain. He hoped the members of the Institute would not come away from Stratford and tell them that Shakespeare did not write the plays. His lordship then referred to the several excursions fixed for the week, mentioning the many objects of interest which would thus be brought under their notice, and expressed the great pleasure it would give him to welcome them to Stoneleigh.

### TESSERÆ.

#### Architecture at the Beginning of the Century.

T. L. DONALDSON.

IN the first quarter of the present century our art was at a very low ebb. The long and dreadful struggle with France had absorbed all the nation's resources. We had no spare money to bestow upon architecture, properly so called. The Government confined its expenditure to buildings required for the commonest purposes, raised in the most economical manner and with ordinary materials. The speculative builder superseded the accomplished architect, and erected, for the nobility and gentry, rows of square boxes of brick or stucco houses as mansions, without any pretension to effective decoration or dignified aspect. Shut out from intercourse with the Continental schools of art, there were not half a dozen men of superior qualifications among the professed architects of England. The Chambers and the Adams of the eighteenth century had passed away, and only a very weak tradition of the merits and taste of those great men remained. James Wyatt, Dance, Soane, the elder Hardwick, [and, not to omit Nash, were at the head of the profession. Sir Robert Smirke had but just entered the field, afterwards occupying a position so

distinguished and honourable to himself. The Grecian Wilkins had not yet made himself a name. Stuart's "Athens" was opening a new phase of art, and Britton and the oldest Pugin were reviving the interest in our Mediæval antiquities. But as for the literature of architecture, it was almost *nil* in England. Mr. Laing and Mr. Joseph Kaye, men of elegant taste and amiable disposition, but not of vigorous temperament, were pursuing a successful practice, but not with very striking distinction; for their productions, however graceful in detail, were not powerful in general effect. There was, therefore, wanting in the profession an energy of effort and strong purpose to carry out noble ideas of the highest class; in fact, it was rather suppressed than encouraged.

#### The Oldest Architectural Drawing.

W. BURGESS.

A plan of the Monastery of St. Gall is now preserved in the library of that establishment. It was first published by Keller, at Zurich, in 1844, and republished two-fifths the real size in the "Archæological Journal," p. 87, vol. v., with a most excellent notice by Professor Willis. The plan, which is drawn in thin red lines upon a large sheet of parchment, with inscriptions all over it, showing the uses of the different parts of the building, was sent, as one of the said inscriptions informs us, for the use of the Abbot Gospertus (who began to rebuild the church and monastery in 829), by some anonymous friend, who is supposed with some reason to have been Eginhard, the son-in-law of Charlemagne, who held the office of prefect of the royal buildings. However this may be, the plan presents us with a very complete monastery, with its great church and accompanying buildings. The red line not only serves to mark the external and party walls, but also to indicate the furniture, such as benches, tables, stoves, &c., requisite to each building. The plan, as Professor Willis very properly remarks, is not done to scale, but certain figured measurements enable us to form some idea of the size of the buildings. The church would appear to have been a most noble structure, with two apses and three paradises or semicircular walks. The western one was further enriched with two circular towers. The winding stairs of these latter are shown as gradually winding round from the circumference to the centre, like a section of a snail-shell. It is doubtful whether a common winding staircase is thus represented, or whether it was really an inclined plane, which went from the circumference to the centre, and so on to an upper chamber, where there was an altar, in the one case dedicated to St. Michael, and the other to St. Gabriel: there would, supposing the latter supposition to be correct, be room to hang the bells in the space between the newel and circumference in the upper part of the tower. The ornamental finial at the top is shown on plan as finishing the newel. The arches of the cloisters and the crosses of the altars are shown in elevation on their respective places on the plans, a mode which still obtains in Turkey at the present day, even among the distinguished native architects who have the honour of working for His Imperial Majesty the Sultan, so little have things changed in the East. Another peculiarity in this St. Gall plan is, that sundry squares are drawn in the middle of courtyards and of buildings. These, as Professor Willis suggests, might be either indications of the Classic atrium with its uncovered impluvium, or a sort of upper lantern rising above the roof and giving light by means of clerestory windows. Both these explanations are very feasible, and both probably were intended in the original. Lastly, Eginhard, or whoever was the architect, wrote certain explanations in Latin verses on various parts of the drawing. Fancy that most matter-of-fact production, a modern plan, ornamented with metrical directions to the builder!

#### The Sarcophagi in the Arles Museum.

J. B. WARING.

Very important and interesting series of sarcophagi are preserved in the Museum at Arles; dates are unfortunately wanting, and the names, which are Roman, though the persons were probably Gauls, afford no aid; they may, however, be generally assigned to between the third and sixth centuries: they are of the usual Roman sarcophagus type, carved with subjects from the Old and New Testaments. Those most in vogue were the Saviour and the Apostles, sometimes in a continuous row, sometimes separated by columns. Once here, and once at Narbonne, we find trees instead of columns, very tastefully arranged, with birds in the foliage; the trees are apparently olive, the birds are doves. The miracles of the Saviour are also shown: these also are sometimes continuous, sometimes divided by colonnettes: in the centre is usually a female figure with hands outstretched—intended, no doubt, for the Virgin Mary. From the Old Testament we have mostly Moses striking the Rock, Pharaoh in the Red Sea, Daniel in the Lions' Den, and the Sacrifice of Isaac. The tomb of the Labarum is carved with the Twelve Apostles without divisions, a line of cloud passes behind their heads with stars, and over each head a lion's paw holds a wreath or crown: in the centre is a large wreath containing the monogram of the Saviour

resting on a cross, with two doves; two soldiers kneel at the foot of the cross, one on each side: over the Apostles are two genii or angels supporting circular medallions containing a male and female bust, and again two genii holding an oblong tablet without an inscription. Each angle terminates in a large mask, the facial line forming the angle. On one end is St. John baptising, and on the other Moses striking the rock. This tomb is known locally as that of Constantine; it not improbably belonged to his family, and we may conclude it to be a work of the second half of the fourth century. Sculpture is here seen founded on a good model, but somewhat rough of execution and heavy in proportion; the faces are singularly *à l'antique*; some of the Apostles are also of the Jewish cast of the best kind. No nimbi occur in these, or in any other example (except a very rough and unimportant one) in the collection. The dress consists of tunic and sandals; all the eyes have holes in the pupils, and generally also at the angle of the nose, to give expression. The whole character is strongly marked Roman; and though the heads are large, the hands clumsy, and the style conventional, yet there is a certain simplicity and nobleness about them by no means to be despised; some few of the heads are indeed first-rate, exhibiting such peculiarities as to lead one to conclude they are portraits. At any rate, we find here a school of sculpture at an early Christian period—the best, I should say, then existing, and which ranks much above the stupid faces and lanky figures, the streaky hair and stiff drapery, the minute folds and jewelled borders, of sculptured art in the same district, which reached its bathos in the twelfth century.

#### Chryselephantine Statues.

JOHN BELL.

There were many ancient Greek statues that at any rate were not monochrome, but of various colours, and in many cases, I believe, painted up to full tints. These, however, were not, I conceive, usually in marble, but their chief examples come under the head of the chryselephantine art of the Greeks used in the temples. These Greeks, like the Egyptians, made gigantic statues of their gods—Jupiter, Juno, Minerva, Apollo, &c.—not, however, in granite, but sometimes in marble. Usually, however, these very large figures were made in metal, either cast or beaten work, or in ivory and gold, that is, with a surface of thin veneers of ivory and plates of gold laid over a framework of wood, so fashioned as just to allow their thickness to make up the substance, form, and surface required. This seems, no doubt, a strange patchwork way of making up a god, like a piece of upholstery, and vastly inferior in dignity to hewing him out of granite or marble, and, indeed, had we not reliable data for the practice, we could hardly have believed that such a people as the Greeks would have so wrought. First, I would premise that these chryselephantine, or gold and ivory statues, were not uncommon in Greece and the Grecian islands—indeed, that it was a received way of making a god in those days, and that, moreover, they were not unfrequently of great size. The *Jupiter* of Elis, although seated, was 60 feet high, and the *Minerva* of the Parthenon, standing, 40 feet. Both of these were by Phidias. Among various other large examples of this art were the *Juno* of Argos, by Polyclethus; the *Æsculapius* at Epidaurus, by Thrasymedes; and the *Great Goddesses* at Megalopolis, by Damaphoon. The first thing to be done in making these giant works, after the model was prepared, was to put together a great framework of wood as a core, yet hollow within so that the workmen could get inside to adjust the work and rivet the veneers of ivory and gold which were to form the surface, and no doubt for convenience they had stages and staircases within these great statues, the wooden framework of which was, as Müller informs us, strengthened across with rods of metal. But he shall speak for himself. In division 312 of his elaborate work on ancient art, this author thus informs us:—"The ancients received from India, but especially from Africa, elephants' teeth of considerable size, by the splitting and bending of which, 'a lost art,' but one which certainly existed in antiquity, they could obtain plates of ivory from 12 to 20 inches in breadth." I may here be allowed to remark that in the Exhibition of 1851 this "lost art," so called by Müller, seems to have been revived, and carried even further than by the Greeks. A prize medal was awarded on that occasion to Messrs. J. Pratt & Co., Meridan, Connecticut, United States, for specimens of ivory veneers cut by machinery. "These veneers were exceedingly delicate"—I am quoting the official report—"one piece alone being 12 inches in breadth and 40 feet in length, and having been sawn from a single tusk." But to return to these great Greek statues. "In executing one of these," says Müller, "after the surface of the model was distributed in such a way as could best be reproduced in these plates, the individual portions were accurately represented by sawing, planing, and filing the ivory, and afterwards joined together, especially by the use of isinglass, over a kernel of wood and metal rods. The holding together, however," he adds, "of the pieces required incessant care"; as, indeed, we may well conceive, as

ivory is apt to expand and contract, and warp and curl, in changes of moisture and temperature. Indeed, it must be acknowledged that the whole process and sham nature of the work thus described impresses us with want of dignity, lack of permanence, and the necessity of repair. From a passage in Valerius Maximus, it appears that Phidias desired to make the figure of *Minerva* for the Parthenon, not after this fashion, but in marble; he was, however, overruled. Had the sculptor had his way, we should probably have had now existing some grand and noble remains of it, in addition to those invaluable fragments of some of the subordinate statues which we possess in the British Museum.

#### Crushing of Masonry.

E. NASH.

Crushing of material is a subject that necessarily comes under the architect's observation. In 1848 the columns of a new church were formed of chalk; this was, of course, the grey chalk, which is a sound homogeneous material and if kept dry will sustain a good weight, but in this case wet got to it and some front, and it went to pieces. It seems to me that when we look at the adverse conditions to which building operations are exposed, it is scarcely wise to use so absorbent and so light a material for bearing purposes. Some kinds of chalk are not unfit for other uses in a building, and a good application of it for ornamental work may be seen in the restoration of St. Cross Church, at Winchester. In the case of a Bath stone column in a modern building, from which sprang four arches, it failed from crushing, or rather it was from breakage. The shaft was a cylinder of 2 feet 3 inches in diameter upon a base 3 feet 3 inches square, and it was the moulded base stone that broke. The weight on the column was about 68 tons, that being 17 tons per square foot, which is less than one-third of the smallest weight that is sufficient for crushing according to experiments, which have shown that it takes at least 54 tons per square foot to crush good Bath stone. The discovery of the failure was made soon after the building had been roofed in, and all was in very perilous condition, inasmuch as if this shaft had come down nearly the whole building would have followed. The stone that broke was the one used at the ceremony of what is called laying the first stone. It was 1 foot 6 inches thick, and 3 feet 3 inches square, and in the centre of the stone beneath it was a small hollow for a bottle of coins, so that there was no bearing in the immediate heart of the work; but the failure was not caused by this, but by the improper manner in which the stone was bedded by a noble personage, or rather I should say by the masons who prepared the bedding for his lordship. The foreman thought he must have the mortar peculiarly smooth and good-looking, which was an error to begin with; he then put four stout patches of it on the lower stone, one near each of the four corners, where it got somewhat dry during the time consumed by the ceremonial; and after that time some fine liquid mortar, very much like grout, was put over the general surface, and his lordship trowelled it about, but the four patches were not flattened down nor made homogeneous with the other mortar, yet the stone was then lowered, leaving the four patches as the most solid portions. All stood well for nearly a twelvemonth, until the entire weight came on, and then cracks were observed. There is abundant evidence in both ancient and modern works of the defective mode in which the materials of walls are put together, and though this may be of comparatively slight importance when the walls have not much duty beyond that of being the enclosures of buildings, yet when they have to sustain great weights or thrusts it becomes of paramount importance that their materials be well applied and united, and this fact seems scarcely to have been fully appreciated since the best days of the Greeks and Romans. The crushing of the piers carrying the dome of the Pantheon at Paris is a most instructive warning under this head, and, while deploring the occurrence, we cannot but admire the remarkable mechanical talent displayed by Rondelet in the restoration of them, and the book that was published on the subject is well worthy of study, but the chief defect that I wish to allude to is the absence of that uniformity in the horizontal strata of walls which the word "homogeneous" most expressively indicates, and of which defect the tambour wall under the dome of St. Peter at Rome is a notable example. In a rapid age like the present it is not likely that this homogeneity or similarity of material through the whole thickness of the wall will be thoroughly attended to. I will note a small matter that is slightly connected with the point, namely, that in buildings even of considerable excellence the water tables of buttresses often break away from the body of the buttress, especially when the bulk of the work is of rough stone; this irregular settlement shows that the dressed stone, being more compactly laid than the rough stone, the two do not harmoniously blend, and that a more thorough bonding is needful, by using longer alternate stones that is customary, and it also suggests the idea that buttresses may have too great a projection, inasmuch as the outer part may not catch the due influence of the weight.

## WOODBOURNE.

ROUNDHAY Park was purchased by the Leeds Corporation about sixteen years ago, at a cost of 135,000*l*. Woodbourne was built a few years ago on one of the sites sold by the Corporation after they had reserved sufficient of the original estate of 800 acres to serve their purpose for a recreation-ground. The house is built on well-wooded rising ground above the Waterloo Lake. The porch and wing to the right are recent additions. The new dining-room in the wing is fitted up with a brown oak dado 3 feet 6 inches high, and an elaborately-panelled and moulded ceiling also in brown oak. Messrs. S. E. SMITH & J. TWEEDALE, of Leeds, are the architects.

## HOUSE, POOL BANK.

THIS house, also designed by Messrs. SMITH & TWEEDALE, is being erected on a site embracing one of the most beautiful views in Wharfedale (one of the favourite resorts of TURNER). The terrace commands views of Ormescliffe Crag, Ilkley, and Arthington. The whole of the walling is carried out in tooled local sandstone. The three sitting-rooms have oak dados. The main staircase will be carried out in oak, walnut, teak and mahogany.

## PICTURES BY OLD MASTERS.

A GIFT has just been made to the National Gallery by Sir John Savile, G.C.B., late Ambassador in Rome, of a small sketch by Murillo, three pictures of still-life of the highest quality, and fifty-nine small copies in oil-colour of pictures by Velasquez at Madrid. Arrangements are being made for these last to be hung in a room on the ground floor, where they will as soon as possible be exhibited to the public. The other pictures will be hung upstairs as soon as they have been placed under glass. The Murillo is a very beautiful sketch by the master for his large picture of *The Birth of the Virgin*, now in the Louvre; and, like many of the sketches of Murillo, is so light in touch, so exquisite in colour, as to be, from an artistic point of view, preferable to the finished picture. The other three are (1) a small canvas with lemons and a glass, painted with extraordinary brilliancy, and signed "Jan van de Velde," a very rare master, probably the uncle of the well-known painter of ships; (2) a small panel picture of various still-life objects, including a Japanese sword, signed "H. Steenwyck," also a very rare painter, and not to be confused with the painter of church interiors; (3) a picture with a loaf of bread and a bottle, signed "Chardin, 1773." This will be a welcome addition to the very scanty collection of French pictures. In quality it is as fine as any of the Chardins in the Louvre. All the pictures are in the most excellent condition.

## NATIONAL PORTRAIT GALLERY.

THE 31st annual report of the trustees of this Gallery has just been issued. They deplore the death during the past year of their valued colleague, Mr. Beresford-Hope, M.P., who was for twenty-one years a member of the Trust. To supply the vacancy thus caused at the Board, as well as that caused by the withdrawal of the Bishop of Chester, a Treasury minute had appointed trustees the Earl of Pembroke and the Speaker. In the previous report the purchases were stated to amount to 417; they may now be continued to 420, and include portraits of Lieut.-General Sir James Hope Grant, 1806-1875, by Sir Francis Grant, P.R.A.; Mrs. Sarah Trimmer, 1741-1810, educational writer, painted by Henry Howard, R.A.; and Admiral Sir Cloudesley Shovel, 1650-1707, painted by Michael Dahl. An important alteration of name in one of the principal pictures has recently been made. A portrait formerly in

the possession of Mr. Fraser Tytler, and described as a portrait of Mary Queen of Scots, has been found to be a portrait of her mother, Mary of Lorraine. The manner in which the arms of France and Scotland are quartered clearly indicate the date, 1560, when Francis II. and Mary ruled in France, and Mary of Lorraine was Regent of Scotland. The picture would appear to have been painted whilst the Regent was besieged in Leith, and the distant city and castle among rocks would be intended for Edinburgh. Another picture, presented in May 1877, as a portrait of Sir Randolph Crewe, has since been proved to represent Sir John Bramston, an eminent judge, painted by Daniel Mytens. Several pictures have been cleaned and lined, others have been cleaned, and seven portraits have been put under glass. The number of visitors to the gallery from the commencement in Great George Street, Westminster, in 1859, to September 1885 (when the pictures were removed to Bethnal Green), was 1,493,365.

## PUBLIC BUILDINGS FOR OLDBURY.

AT the monthly meeting of the Oldbury Local Board, a resolution was brought forward by the chairman, Mr. A. Thompson, that it was desirable the Board should take the necessary steps to provide public buildings for the district of Oldbury, which would include a free library, and that the matter be referred to a committee, consisting of the whole Board, to consider and report thereon as to the cost. He remarked that there was no question as to the desirability of public buildings for the town. He had had some plans prepared on his own responsibility in connection with a site he had in view. He thought that Oldbury could now very well afford the expense which would be incurred in erecting public buildings. The site was one which faced the old churchyard and Freeth Street, and that could be purchased for something under 2,000*l*. He estimated that the buildings could be erected for about 2,000*l*, making the total estimated expenditure 4,000*l*, and he did not think it would increase the present rates, because the rateable value of Oldbury was advancing, and the increase in that direction would nearly make up the amount required for repaying the principal and interest. Ultimately the resolution was carried, with one dissident.

## PERMANENCY OF WATER-COLOURS.

THE first report in the experimental investigation of the effect of light on water-colours, in its scientific bearings, by Dr. W. J. Russell, F.R.S., and Captain Abney, R.E., F.R.S., has been issued. A representative committee of artists, appointed to consider the question from the art point of view, have accepted the first report now presented to Parliament, and have acknowledged the thoroughness and ability with which the investigation has been conducted. The committee consisted of Sir F. Leighton, Bart., P.R.A. (chairman), Mr. L. Alma Tadema, R.A., Mr. T. Armstrong, Mr. Sidney Colvin, Mr. Frank Dillon, Mr. Carl Haag, Sir James D. Linton, Mr. E. J. Poynter, R.A., Mr. Henry Wallis, and Mr. Arthur Torrens (secretary).

This committee held four meetings, and Dr. Russell and Captain Abney had numerous communications with individual members, from whom they received valuable information on the subject of their inquiry.

The report now presented deals with the physical effects of light on water-colours. It states that the subject divides itself into at least three parts. First, the nature of the optical changes; second, the character of the chemical changes; and third, the causes which initiate and accelerate these changes. Owing to the time required to carry out such an investigation the report had to be divided into two sections, the first of which is now published.

Some preliminary remarks are made on the optical property of pigments and the different character of lights to which they may be exposed. The following extracts must serve to indicate the lines on which the investigation proceeded:—

Colours, the report states, are popularly talked of as greens, blues, reds, &c., and to these distinctive appellations are added by artists. Thus they talk of emerald green, cobalt blue, Venetian red, &c. Though to some extent to the trained eye an idea is thus given of the hue and luminosity of the colour, yet to the scientific experimentalist the definitions of colours require supplementing, and in estimating any change which may take place in them an exact quantitative value of each is a desideratum. As to why a pigment is coloured, science has hitherto not furnished a satisfactory answer; nor for the inquiry which we have undertaken is it at all necessary that an answer should be given. The question, however, as to how a pigment produces the impression of colour, is one which can be answered. Colour is due to the selective action of the pigment, or stain, on light. That is to say, the rays of certain

wave lengths, or colours, are transmitted and reflected by each pigment, or stain, in a more or less perfect manner, and the others are absorbed. The transmitted and reflected rays will be shown to be identical—except in certain cases which it is unnecessary to consider here—and it is to these that the colour of the pigment is due.

If we decompose a thin slice of white light into its component colours by means of a prism we get what is known as the spectrum, and if we allow this variegated band to fall on a white surface, such as white card or a surface of zinc oxide or barium sulphate, that surface becomes luminous where the colours fall, and they are presented to the eye with the greatest brilliancy possible. If, however, for the white surface we substitute a surface covered with some coloured pigment we at once perceive a difference. That which is generally supposed to be the colour of the pigment is lost, and we have a stripe of the surface illuminated with the different rays of the spectrum, but their different colours are presented to the eye with their brilliancy unequally reduced. Probably no one coloured ray is reflected with the same brilliancy as it was from the white surface, and a large part of the spectrum is very much dimmed. In other words, the pigment does not reflect any component of white light with the same intensity as does the white surface. If by proper means we collect the different coloured rays of the spectrum reflected from the coloured surface, and recombine them, we get back again the colour of pigment. If we measure the brightness of each colour reflected from the pigment in terms of the brightness of the same colours reflected from white paper, we have a quantitative measure of the light reflected from the pigment, such light being that by which the pigment produces the impression of colour. Thus, if we measure the light reflected from cobalt blue in the various parts of the spectrum, we may produce the colour of cobalt on white paper by reducing in proper proportions the different rays of the spectrum formed by white light, and then recombining them. The colour of a pigment, we may say, is dependent on the amount of the components of white light which it reflects back to the eye.

Further, it will be seen that no matter what the source of light may be—whether the yellowish-white light of gas, the purer white of the electric arc light, or of the sun, or the bluer white light from the sky—the comparative measures of the brightnesses of the different colours reflected from the two surfaces will always be the same. Thus, if the spectrum formed by gaslight be used, and the brightnesses of the different parts of the spectrum reflected from a white surface and from a coloured surface be compared, the comparative values of the different rays thus obtained will be the same as if the source of light had been the sun. To see what will be the colour of a pigment by gaslight, the rays of the spectrum of gaslight must be reduced in the proper proportion found for the particular pigment, and be again recombined, and this will give the colour of the pigment seen by gaslight. In the same way, if the spectrum be formed by sunlight, the different parts of that spectrum must be reduced in exactly the same proportion, and the recombined spectrum will give the colour of the pigment as it would be seen in sunlight. Careful measurements of the various simple and mixed water-colours which are usually employed by artists have been made and are given in another part of the report. The source of light employed was the electric arc light, and the relative intensities of the different coloured rays were measured by a method which was described in a paper recently read before the Royal Society.

In tracing the sequence of phenomena which happen when white light falls on a coloured surface, it is stated that colours may be divided into two classes, those which are insoluble and those which are soluble in water. Many of the soluble colouring matters are precipitated as lakes, and the same arguments hold good for these as for the solid pigments. In the case of an insoluble pigment a ray of white light falls on one of the particles, but only some components of the light can pass through it, and it emerges after its passage as coloured. This strikes the next particle, and part is reflected back, reaching the eye as coloured light, but part penetrates through the next particle. This in its turn is partly reflected back and partly transmitted, and so on. At the same time, however, a certain amount of white light is reflected from the surface of the particles, and mixes with the coloured light, which has passed through one or more particles. Hence the colour of a pigment always contains a certain percentage of white light, together with the coloured light. Thus the colour of Prussian blue is principally due to the transmission through the particles of a large proportion of the violet blue and blue-green rays, together with a small quantity of white light reflected from the surface of the particles to which the original light falling on it had direct access. It may be remarked that when thin washes of these colours are washed over white paper the number of coloured particles are comparatively few, and that the white paper reflects relatively more white light to the eye. A microscopic examination of such a surface reveals this fact in a

very interesting manner. The colour is, therefore, less intense in hue, and whiter. The nearest approach to the real colour of a water-colour pigment is seen when a mass of the moist colour is on the palette, the white light reflected being then at its minimum. The same argument applies to those colours which are soluble and which, consequently, we may take to be continuous. The light which penetrates such a colour will be of the same hue as that reflected to the eye from the paper. The white light passes through the stain, loses certain portions of the original spectrum colours, is reflected from the white paper beneath, and is once more transmitted through the colour, reaching the eye as a coloured light. Thus the colour of the carmine (cochineal) is due to the transmission by the dye of most of the red and a good deal of the blue of the spectrum of white light. The effect of mixing a white with a coloured pigment is to cause more white light to be reflected, and thus to give a pale and less transparent appearance to the colour.

A comparison is then instituted as to the light reflected from colours with that transmitted from them, and it is stated that in the Prussian blue the reflected and transmitted light are very nearly identical, but in the carmine the transmitted light was less than the reflected. The small difference in the first case and the larger difference in the second is due to the fact that the depth of colour in the reflected and transmitted lights was not equal.

Of the effects of absorption, the report says it is a received axiom in physical science that in any body which absorbs radiation, the energy so disappearing performs work of some kind in that body. The work so done is a raising the temperature of the body, a chemical decomposition of the body, or a rearrangement of its molecular condition, as for instance in the iodide of mercury. Each kind of work may be done at the same time, but the energy which is expended on one form cannot be again expended on another form of work. On elements such as carbon, gold, &c., the work done only raises the temperature of the body above that of the surrounding objects, but in chemical compounds, such as nearly all the pigments in use are, there may be besides a chemical decomposition. The chemical decomposition of a colour means a fading or an alteration in its colour, but the raising of its temperature to the small degree which the visible (light), or invisible, radiation to which it is ordinarily exposed can effect, does not alter its composition or colour. That the temperature above that of the surrounding objects to which a colour can be raised, even by sunlight, when freely exposed, is small, is not only shown by theoretical reasoning, but by direct experiment. In the case of a wash of water-colour, the particles on which the radiation falls are very small, and they consequently have a large surface compared with their volume. As the rapidity of loss of temperature in equal volumes under the same conditions is in the ratio of the radiating area, it follows that the loss of temperature by radiation in the small mass is very nearly equal to its gain. In other words there is an equilibrium of temperature established which is but very little higher than the temperature of surrounding objects. When chemical decomposition takes place by light, however, the results are different. The decomposition once effected remains, and the quantity of the matter decomposed increases with the length of exposure. The outside of the particles is first acted upon, and then gradually (as light continues to act) the inner portions are decomposed, until finally the whole particle is changed. Evidently those colours, the effect of light on which is to bleach them, are the most rapidly acted upon. Again, too, the large area of the surface of particles, as in a water-colour, compared with their small volume, is favourable for the rapid effect of the action of light in altering their composition.

As work depends upon absorption, it is important to remember that when the radiation (light) is decomposed into its prismatic components, it is only those rays of the spectrum which are absorbed that can do this work. Thus, if a pigment only absorbs in the red, it is only the red rays which can do work and no others, and so on.

Chemical action in bodies and the action of "light" waves on atoms and molecules are dealt with. As to the light to which pigments in water-colour drawings are ordinarily exposed in a room, it is stated that there is no doubt that pictures are, as a rule, carefully protected from direct sunlight, but it is nevertheless true that the greater portion of the light they receive is reflected sunlight. On a bright day clouds reflect sunlight, and on a dull day the principal part of the diffused light is also sunlight which is reflected according to the laws of geometrical optics from particle to particle, a certain percentage eventually reaching the earth through the clouds. There is, of course, also a fair proportion of the light due to the sky, and this light is bluer than reflected or diffused and weakened sunlight. In cases where the windows of a gallery are in the vertical walls and have an uninterrupted view of the horizon, the blue light reflected is comparatively small, the light near the horizon being distinctly more like sunlight than is that nearer the zenith. In galleries lighted like those at South

Kensington by skylights the light to which pictures are subjected is on the whole bluer. The artificial lights to which water-colours are exposed are gaslight, the arc and incandescence electric lights, and the first and last are very deficient in blue rays.

In conducting the experiments it became necessary to choose the light which would most readily adapt itself to giving a clue as to which colours were affected by exposure in a time which would be measured by months instead of by years. A careful consideration led us directly to avail ourselves of as much sunlight as we could secure in this rather sunless climate of ours, together with the diffused and skylight, when sunshine was absent, which would act less energetically. We are aware that writers have expressed themselves as disinclined to accept deductions as to the fading of pigments when exposed to this bright light of the sun, but they have, as far as we are aware, never given any serious reasons for their disinclination. Their arguments have usually been based upon their own convictions rather than on experimental proof of any kind, or if experimental proof has been quoted from other writers, half the truth or more is most frequently and probably unwittingly concealed. Probably, however, they express what is in the minds of many, so we shall enter somewhat fully into the arguments which decided us to adopt the step we did.

To the eye the hue of the lights mentioned above undoubtedly differ considerably, and unless the cause of the difference had been tracked out experimentally, and with scientific exactness, it would have been unwise to have chosen out any one of them with which to conduct experiments, since the results obtained with it might not be applicable to any other. Happily, however, for such work, the spectroscopic analysis of light furnishes irrefutable evidence that from the results obtained from exposure to one light, correct deductions may be made as to what would happen were the exposure made to another.

The results of the experiments with various colours are dealt with in detail, and include the exposure of colours to light, to dry air, to moist air, to light in presence of hydrogen, to light in vacuo, and also the results of experiments with the colours as they are affected by combustion of gas, heat without light, electric light, &c. Besides single colours the action of light was tried on mixtures of two or more colours, Sir J. D. Linton and Mr. E. J. Poynter and others having been consulted. Whatman's paper was used, and the colours to be tested were applied by a practised hand to the paper in a series of washes. Two strips cut from the same sheet were introduced into a glass tube  $\frac{3}{4}$ -inch in diameter and 2 feet long. The tubes were hung in the open against a wall facing south in full sunshine. One half of each tube being covered with American cloth, the two pieces of identically tinted coloured paper were under the exact same conditions in all respects, except that one was exposed to light and the other was in the dark. The following (table 2 in report) shows approximately the order of instability of the single colours in open tubes exposed in an ordinary atmosphere, beginning with the most fugitive:—

Carmine, crimson lake, purple madder, scarlet lake, Paynes grey, Naples yellow, olive green, indigo, brown madder, gamboge, Vandyke brown, brown pink, Indian yellow, cadmium yellow, Leitches blue, violet carmine, purple carmine, sepia, aureolin, rose madder, permanent blue, Antwerp blue, madder lake, vermilion, emerald green, burnt umber, yellow ochre, Indian red, Venetian red, burnt sienna, chrome yellow, lemon yellow, raw sienna, terra verte, chromium oxide, Prussian blue, cobalt, French blue, and ultramarine ash.

Of these thirty-nine single colours, the twelve latter were not acted upon at all by light, and two others were only after this long exposure to direct sunlight very slightly faded. All these, except Prussian blue, are purely mineral colours. Of thirty-four mixtures tried, only three remained absolutely unchanged; but six containing Prussian blue, although at first altered, after being placed in the dark for six weeks or more, returned more or less to their original colours.

In experimenting with light in dry air mostly the same pigments were used. Thirty-eight experiments were made with single colours, but under this altered condition twenty-two instead of twelve were found to be permanent, principally those colours which in the former experiments were only very slightly faded. In two cases the colour in the open tube was not acted on, while that in the dry tube was; these cases are brown madder and Prussian blue. The colours which were unchanged in dry air, but were acted on in ordinary air, are madder lake, cadmium yellow, Naples yellow, emerald green, olive green, Paynes grey, sepia, and burnt umber. Again, with the single exception of madder lake, all the above which were not acted on in dry air are mineral colours.

For exposure of colours to light in moist air, the paper was saturated with moisture, and was sealed up in tubes containing moist air. Thirty-seven experiments with single colours were made. Only ten colours withstood the action of light under this condition; these were Indian red, Venetian red, burnt sienna, yellow ochre, raw sienna, emerald green, terra verte,

chromium oxide, cobalt, and ultramarine ash. No vegetable colour is in this list; and both Prussian blue and Antwerp blue were entirely destroyed. Twenty-nine mixtures were also tested in a similar way, and only two remained unchanged; these were raw sienna and Venetian red, and cobalt and Indian red.

In a series of experiments made in which the colour was exposed in an atmosphere of moist hydrogen gas, thirty-six were made with single colours, and of these no less than twenty-two remained unchanged; even carmine and crimson lake did not alter, neither did madder lake, Indian red, Venetian red, brown madder, burnt sienna, chrome yellow, yellow ochre, raw sienna, terra verte, chromium oxide, olive green, indigo, cobalt, French blue, ultramarine ash, permanent blue, Paynes grey, sepia, Vandyke brown, and burnt umber.

In exposure of colours in vacuo hardly any colour was affected by light, and action where it occurred was very feeble. Mixtures containing Prussian blue changed, the other colour becoming dominant. Vermilion also blackened. With other mixtures hardly any change occurred. With colours placed in a close cupboard, lighted by gas, and of course free from moist air, hardly any change occurred. Under exposure to electric light, the light falling on the colours is estimated as having an illuminating value of 2,000 candles at a foot off, little change, and in the majority of cases no change, took place with colours or mixtures. The colours selected for testing in this case were those most easily acted on, some in a frame with a glass in front and others in sealed tubes with moist air, being the most favourable condition for fading. The action of heat without light was tested by sealing strips of colours in tubes with moist air and heating them seven hours a day for three weeks in boiling water, all light being excluded. Indian yellow changed very decidedly, a mixture of Prussian blue and gamboge went brown, also a mixture of Prussian blue and burnt sienna and Prussian blue and raw sienna, Antwerp blue, Leitches blue, and permanent blue all bleached. In a second experiment the permanent blue did not change. Indigo and Venetian red also bleached very slightly and became more red in colour, whereas carmine, crimson lake, vermilion, Venetian red, Prussian blue, indigo, sepia, and brown pink underwent no change. Two tubes with rose madder were used, one of them bleached very slightly, the other not at all.

The action which must occur on diluting any colours with a solid white medium, such as Chinese white, is pointed out, but it is stated that but few comparative experiments have yet been made. Mixtures of rose madder and Indian yellow, and of Prussian blue and gamboge, when mixed with Chinese white faded more rapidly than without it, and a mixture of Prussian blue and crimson lake are strikingly acted on, for without Chinese white the mixture becomes blue, but if mixed with Chinese white it becomes of a bright pink colour. The fading of Prussian blue appears to be brought about by the addition of Chinese white. On the general question the deduction is made that fading is chiefly due to the blue rays of light, and that between sunlight and skylight of equal intensity sunlight is the safest, since it contains a far less proportion of blue light than does skylight.

The final results, it is explained, were obtained after an exposure between May 1886 and March 1888, during which time there had been about 3,000 hours of sunshine in all, 2,100 of which we may take it fell on the colours. Making the same estimates as before, we find that this was equivalent to 8,800 hours of mean blue skylight. There would be left about 8,000 hours of light during which no sun was shining. Taking it as before, we should find that this was equal to 6,000 hours of subdued blue skylight, and, when reduced to one-third, would be equivalent to 2,000 hours of mean bright blue skylight. This, with the sunlight, would give a total of 10,800 hours of the blue skylight to which the pigments were exposed, or about 4.8 times the amount which they received between May and August 1866. To produce the final result, therefore, we should have had to expose them in the gallery for at least 480 years, and to the gaslight continuously for 9,600 years. Had we exposed to the whole of the light coming from the southern sky alone, shielding the colours from direct sunlight, we should have had to extend our observations for four years, and if to a northern sky probably for nearer 10 years, since the mean brightness of the latter is considerably less than the former.

Among the conclusions arrived at it is found that mineral colours are far more stable than vegetable colours, and amongst those colours which have remained unaltered, or have only very slightly changed after an exposure to light of extreme severity, a good gamut is available to the water-colour artist.

The presence of moisture and oxygen are in most cases essential for a change to be effected, even in the vegetable colours. The exclusion of moisture and of oxygen, particularly when the latter is in its active condition, as experiments to be described in the next report will show, would give a much longer life, even to these, than they enjoy when freely exposed to the atmosphere of a room. It may be said that every pigment is

permanent when exposed to light "in vacuo," and this indicates the direction in which experiments should be made for the preservation of water-colour drawings.

The effect of light on a mixture of colours which have no direct chemical action on one another, is that the unstable colour disappears, and leaves the stable colour unaltered appreciably.

The experiments also show that the rays which produce by far the greatest change in a pigment are the blue and violet components of white light, and that these, for equal illumination, predominate in light from the sky, whilst they are less in sunlight and in diffused cloud light, and are present in comparatively small proportion in the artificial lights usually employed in lighting a room or gallery. They have also shown that about a century of exposure would have to be given to water-colour drawings in galleries lighted as are those at South Kensington before any very marked deterioration would be visible in them, if painted with any but the more fugitive colours, and that when the illumination is of the same quality as that of gaslight, or of the electric glow light rendered normally incandescent, and of the same intensity as that employed in those galleries, an exposure to be reckoned by thousands of years would have to be given to produce the same results.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### ADDISON ON ARCHITECTURE.

ACCORDING to Dr. Johnson everybody who desires to write in a style that is elegant without being ostentatious, and familiar without being coarse, should give days and nights to the study of Addison's essays, but it is to be feared that very few now follow the advice of the sage of Fleet Street. One might ask, like Burke in respect to Bolingbroke, "Who now reads Addison?" Extracts from the *Spectator* are published as a school-book—which is an infallible way to make a writer disliked—and an occasional edition of the whole work may appear as part of a series, but opinion now runs in favour of Steele's papers rather than Addison's, as they are supposed to be inspired by a more genial spirit and affection. Whatever may be the eventual decision as to the relative worth of the two essayists, it ought not to be forgotten that the revival of "Queen Anne" was in a measure owing to admiration for Addison. Thackeray, while having a kindly feeling for the foibles of Steele, recognised the superiority of the scholar and moralist to whom poor Dick always looked up as if he were a small boy and his friend a monitor. In Thackeray's lectures, and especially in his "Esmond," the Queen Anne period assumed a new and ideal form, and the public were prepared to approve of anything which recalled it. The novelist having set the example of building a red-brick house, the imitation of the so-called Queen Anne style became easier.

It would not, however, be right to assume that Addison was filled with any affection for the English adaptations of Flemish buildings. He was never a patron of the builder's art. When he was not living in lodgings, or in a college-room, he could not be called the tenant of a house, and after his marriage he was not master when his wife was present. His views on Domestic architecture, assuming that he condescended to think of that subject, are unknown to us and are not to be inferred from any of his actions.

His one essay on an architectural subject (which we now reprint) shows that his ideal building was the Pantheon in Rome, and unless a work was great, uncommon or beautiful, it was not satisfactory in Addison's eyes. In the beginning of the eighteenth century he could discover few buildings in England that might be said to possess the desirable qualities, especially as he was incapable of recognising the beauties of any of the Gothic cathedrals or churches. Addison was deficient in a knowledge of art, but his essay is interesting as evidence of what was thought about architecture by the Englishman whose taste was the finest of his time. The original appeared on Thursday, June 26, 1712, and is part of the series on the Imagination.

*Addite tot egregias urbes, operumque laborem.*

VIRG. *Georg.* ii. 155.

Next add our cities of illustrious name,

Their costly labour, and stupendous frame.—DRYDEN.

Having already shown how the fancy is affected by the works of nature, and afterwards considered in general both the works of nature and of art, how they mutually assist and complete each other in forming such scenes and prospects as are most apt to delight the mind of the beholder, I shall in this

paper throw together some reflections on that particular art which has a more immediate tendency than any other to produce those primary pleasures of the imagination which have hitherto been the subject of this discourse. The art I mean is that of architecture, which I shall consider only with regard to the light in which the foregoing speculations have placed it, without entering into those rules and maxims which the great masters of architecture have laid down, and explained at large in numberless treatises upon that subject.

Greatness, in the works of architecture, may be considered as relating to the bulk and body of the structure, or to the manner in which it is built. As for the first, we find the ancients, especially among the eastern nations of the world, infinitely superior to the moderns.

Not to mention the tower of Babel, of which an old author says there were the foundations to be seen in his time which looked like a spacious mountain, what could be more noble than the walls of Babylon, its hanging gardens, and its temple to Jupiter Belus that rose a mile high by eight several storeys, each storey a furlong in height, and on the top of which was the Babylonian observatory? I might here likewise take notice of the huge rock that was cut into the figure of Semiramis, with the smaller rocks that lay by it in the shape of tributary kings; the prodigious basin, or artificial lake, which took in the whole Euphrates, till such time as a new canal was formed for its reception, with the several trenches through which that river was conveyed. I know there are persons who look upon some of these wonders of art as fabulous, but I cannot find any ground for such a suspicion, unless it be that we have no such works among us at present. There were indeed many greater advantages for building in those times, and in that part of the world, than have been met with ever since. The earth was extremely fruitful, men lived generally on pasturage, which requires a much smaller number of hands than agriculture. There were few trades to employ the busy part of mankind, and fewer arts and sciences to give work to men of speculative tempers, and, what is more than all the rest, the prince was absolute, so that when he went to war he put himself at the head of a whole people; as we find Semiramis leading her three millions to the field, and yet overpowered by the number of her enemies. 'Tis no wonder, therefore, when she was at peace, and turning her thoughts on building, that she could accomplish such great works with such a prodigious multitude of labourers; besides that in her climate there was small interruption of frosts and winters which make the northern workmen lie half the year idle. I might mention, too, among the benefits of the climate what historians say of the earth, that it sweated out a bitumen or natural kind of mortar, which is doubtless the same with that mentioned in Holy Writ, as contributing to the structure of Babel. Slime they used instead of mortar.

In Egypt we still see their pyramids, which answer to the descriptions that have been made of them; and I question not but a traveller might find out some remains of the labyrinth that covered a whole province, and had a hundred temples disposed among its several quarters and divisions.

The wall of China is one of these eastern pieces of magnificence which makes a figure even in the map of the world, although an account of it would have been thought fabulous were not the wall itself still extant.

We are obliged to devotion for the noblest buildings that have adorned the several countries of the world. It is this that has set men at work on temples and public places of worship, not only that they might, by the magnificence of the building, invite the Deity to reside within it, but that such stupendous works might at the same time open the mind to vast conceptions, and fit it to converse with the divinity of the place. For every thing that is majestic imprints an awfulness and reverence on the mind of the beholder, and strikes in with the natural greatness of the soul.

In the second place, we are to consider greatness of manner in architecture, which has such force upon the imagination that a small building where it appears shall give the mind nobler ideas than one of twenty times the bulk, where the manner is ordinary or little. Thus perhaps a man would have been more astonished with the majestic air that appeared in one of Lysippus's statues of Alexander, though no bigger than the life, than he might have been with Mount Athos, had it been cut into the figure of the hero, according to the proposal of Phidias, with a river in one hand, and a city in the other.

Let anyone reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing! and at the same time consider how little in proportion he is affected with the inside of a Gothic cathedral, though it be five times larger than the other, which can arise from nothing else but the greatness of the manner in the one, and the meanness in the other.

I have seen an observation upon this subject in a French author, which very much pleased me. It is in M. Freart's parallel of the ancient and modern architecture. I shall give

it the reader with the same terms of art which he has made use of. "I am observing," says he, "a thing which, in my opinion, is very curious, whence it proceeds that in the same quantity of superficies the one manner seems great and magnificent, and the other poor and trifling; the reason is fine and uncommon. I say, then, that to introduce into architecture this grandeur of manner, we ought so to proceed that the division of the principal members of the order may consist but of few parts, that they be all great and of a bold and ample relieve and swelling, and that the eye beholding nothing little and mean the imagination may be more vigorously touched and affected with the work that stands before it. For example, in a cornice, if the gola or cymatium of the corona, the coping, the modillions or dentelli make a noble show by their graceful productions, if we see none of that ordinary confusion which is the result of those little cavities, quarter rounds of the astragal, and I know not how many other intermingled particulars which produce no effect in great and massy works, and which very unprofitably take up place to the prejudice of the principal member, it is most certain that this manner will appear solemn and great, as, on the contrary, that it will have but a poor and mean effect where there is a redundancy of those smaller ornaments, which divide and scatter the angles of the sight into such a multitude of rays so pressed together that the whole will appear but a confusion."

Among all the figures of architecture there are none that have a greater air than the concave and the convex, and we find in all the ancient and modern architecture, as well in the remote parts of China as in countries nearer home, that round pillars and vaulted roofs make a great part of those buildings which are designed for pomp and magnificence. The reason I take to be, because in these figures we generally see more of the body than in those of other kinds. There are, indeed, figures of bodies, where the eye may take in two-thirds of the surface; but as in such bodies the sight must split upon several angles, it does not take in one uniform idea, but several ideas of the same kind. Look upon the outside of a dome, your eye half surrounds it; look upon the inside, and at one glance you have all the prospect of it; the entire concavity falls into your eye at once, the sight being as the centre that collects and gathers into it the lines of the whole circumference. In a square pillar the sight often takes in but a fourth part of the surface, and, in a square concave, must move up and down to the different sides before it is master of all the inward surface. For this reason the fancy is infinitely more struck with the view of the open air and skies that passes through an arch than what comes through a square or any other figure. The figure of the rainbow does not contribute less to its magnificence than the colours to its beauty, as it is very poetically described by the son of Sirach, "Look upon the rainbow, and praise Him that made it; very beautiful it is in its brightness; it encompasses the heavens with a glorious circle, and the hands of the Most High have bended it."

Having thus spoken of that greatness which affects the mind in architecture, I might next show the pleasure that rises in the imagination from what appears new and beautiful in this art; but as every beholder has naturally a greater taste of these two perfections in every building which offers itself to his view than of that which I have hitherto considered, I shall not trouble my reader with any reflections upon it. It is sufficient for my present purpose to observe that there is nothing in this whole art which pleases the imagination but as it is great, uncommon, or beautiful.

#### A Royal College of Architecture.

SIR,—In conclusion, I desire to protest against Mr. Fleming's illogical method of argumentation, and I feel sorry to have to accuse him of repeated *ignoratio elenchi*. Since I shall not, for the present, again address you on this subject, for the very good reason stated in the commencement of my last letter, therefore I hope no one will think it fair to misunderstand and to so criticise this one particular letter in such a manner as to tempt me to reply. But in any case I shall not presume to further occupy attention on a matter concerning which I deny the privilege of competence to abler men than myself.

The discussion and organisation of extensive university schemes is not my forte. As Mr. Fleming truly says, it would require a paid organiser of no mean abilities. My first two letters were all I had intended, until he interrupted what might have been a truly profitable sifting of the subject, for doubtless others would have enlarged thereon.

My whole scheme rests solely upon the contents of those first two letters, and not upon that casual, though very significant item, "the ventilation of a grievance," as any practised

logician would have known. Now there is nothing in those two first letters which Mr. Fleming has or can disprove; no, nor in anything I have written subsequently. In them will be found the outcome of a practical, personal, and thorough acquaintance with what is wanted, and in a very ordinary and common-sense manner I presumed to suggest a remedy. Mr. Fleming informs me that his Society cannot possibly undertake anything so extensive; the which I thoroughly believe. I never asked it to; in fact, I have already said it is beyond the reach of the Architectural Association.

The whole matter resolves itself into a triangular problem:—(1) Some such provision is needed; (2) it is within the means of unselfish and energetic co-operative efforts; (3) who will do it?

One only of these necessary quantities is absent. Will Mr. Fleming answer me which? In France, that home of architecture and art, given the two first, and the last would immediately present itself. Such would also be the case with her young and willing pupils in the United States; yea, such is already the case in both countries.

Am I to believe that Mr. Fleming really desires me to communicate with the secretary of the Affiliated Societies' sub-committee of the Association (Architectural Association, I presume)? I do not know them. Mr. Fleming says he issued the circular-letter. Should I not write to him? I am in a dilemma. I know not with whom to communicate. In that letter occurs the regal *We*. "The men *we* want to reach;" perhaps "*we*" means the sub-committee, Architectural Association. However, this, with the circumstance of a copy gratis of the Architectural Association "Notes," appears to make it a rather delicate question as to how far, and to what intent, the publication of the letter is private.

If private, as Mr. Fleming claims it to be, then with what additional force does my former remark apply:—"The very vagueness, the want of assurance that a determined effort was about to be made, doubtless caused many business men to little heed what must have appeared to them a well-meaning attempt, but without backbone."\* I wonder not that only fifty replies came to hand. Must I accept the "majority" out of ten per cent. as final? Reason forbids me!

No, sir, I will communicate with neither. I am consistent, and I decline to co-operate with any non-responsible person or persons, since I have already expressed my belief that the resources of the Architectural Association are totally inadequate. Of course, should the Royal Institute of British Architects help them in this matter, then the aspect changes; but under those circumstances there is little doubt that the Royal Institute would be overwhelmed with eager assistance from its own ranks, without me; failing which, here I am, *pro bono publico*.

Further, I am at a loss to understand why Mr. Fleming encourages my ideal of a local society in Worcester, while in the same breath he denounces it as impossible—to the Architectural Association. However, he must not imagine that I dream of a Worcester Architectural Society as apart from the general scheme; it would not thus work, and although his sub-committee may think it practicable, I do not. Mr. Fleming also adds that the Royal Institute of British Architects cannot undertake any sufficiently extensive scheme, and although I would rather not accept this information second-hand, yet, if such be the case, then I gladly lay aside my ideas for the present, and anxiously await that enlargement of the scope of the Architectural Association for which he appeals towards the close of his first letter.† If I cannot get all I want, is it reason to refuse part thereof?

Space prevents me to advise upon the uselessness of a little knowledge of logic—it is not like architecture. Perhaps Mr. Fleming will draw his own inference, and learn in the future to distinguish between the main issue and any apt side reference; and also not to imagine that everybody else usually attempts to float theories which they can neither understand or substantiate.

And now, having done all that in me lies to secure the gracious attention of those most concerned, with many apologies, I remain, yours truly,

Worcester: August 2, 1888. FRÉDÉRIC E. THOMASSON.

#### Contrast or Harmony?

SIR,—Can any of your readers advise me in the following matter? I have enlarged an Elizabethan house for a client, the extension being considerably larger than the old part. Old and new work are of stone from the same quarry—a hard sandstone. The old walls are of course a beautiful dark grey, the new ones very light, but still of an agreeable tint. My client objects to the contrast, and proposes to "reface" the old work, to which I of course object. The only alternative he gives me is that I may darken the new walls. How may this best be done to look well and not interfere with the mouldings?—Yours sorrowfully,

IN A FIX.

\* *The Architect*, July 20, 1888.

† *The Architect*, July 6, 1888.

## SCHOOL BUILDINGS.

**Manchester.**—Building operations for new schools at Monton Green, near Manchester, have just been commenced, adjoining the church erected here some time ago. The schools are intended to be a memorial to the late Mrs. Booth, and other members of a family who have been large benefactors to the church. The building will be faced with stone parpoints and Darley Dale ashlar, and contains large school and classrooms for boys, girls, and infants on the ground floor, with meeting room 64 by 32 feet, and social rooms for the use of the congregation on the first floor. Messrs. Thomas Worthington & John G. Elgood, of Lombard Chambers, 46 Brown Street, Manchester, are the architects, and the general contractors are Messrs. W. Southern & Sons, of Salford.

## CHURCH BUILDING AND RESTORATION.

**Llandovery.**—The memorial chapel to Williams Pantycelyn, at Llandovery, was opened on Tuesday last. The cost of the building was 2,200*l.* Accommodation is provided for about 280 worshippers. The architect is Mr. John H. Phillips, of Cardiff.

**London.**—The new church of St. Philip, just opened in Buckingham Palace Road on a site given by the Duke of Westminster, who also gave 4,000*l.* to the building fund, is for a new parish to be formed out of St. Michael's, Chester Square. The building consists of nave and chancel, 120 feet long by 27 feet wide, and north and south aisles 13 feet wide, north and south transepts, morning chapel, and large vestries, with organ chamber over. The accommodation is by chairs for 850 people, and the total cost will be about 8,000*l.* The walls are faced outside with Gainsborough pressed bricks. Inside they are plastered, and have Bath stone dressings. The core of the walls is cement concrete, bonded with hoop iron. The roofs are of pitch pine covered with tiles, and the flèche, which rises to a height of 100 feet, is covered with copper by Messrs. Ewart & Son. The floors are laid with Messrs. Davison & Creed's patent wood-block flooring; the heating is Grundy's hot-air system. Messrs. Macey & Sons, of the Strand, were the general contractors; Mr. Robinson, of Bloomsbury, made the oak stalls; Messrs. Daymond & Son, of Vauxhall Bridge Road, the pulpit; and Mr. G. W. Milburn, of York, the font. Messrs. Carter, Johnson & Co. did the encaustic tiling; the wrought-iron work and gas-fittings were executed by Messrs. Starkie, Gardner & Co. A peal of seven Harrington's chimes has been fixed in the flèche. Messrs. Demaine & Brierley, of York, are the architects, and Mr. T. W. Creed the clerk of works.

**Old Malton.**—The restoration of the old Priory Church, under the supervision of Mr. Temple Moore, F.S.A., is approaching completion. The church is one of the finest remaining houses of the old order of Gilbertines. About ten years ago the lay rector, Earl Fitzwilliam, spent 3,000*l.* on the restoration of the tower and south walls, and the vicar, the Rev. E. A. B. Pitman, is now endeavouring to carry out an idea suggested by the late Sir Gilbert Scott, to make the restoration thoroughly complete, so that the old church may stand an historic monument of the past for many years to come. The work of restoration is now approaching completion. A solid new lead-covered oak roof has been put on, and the floor of the church has been lowered several feet to its original level, showing the beautiful bases of the finely-carved pillars, almost as fresh as when erected nearly 700 years ago. The walls have been cleared of unsightly plaster, the old furnishings entirely removed, and new (patent) Grundy's heating apparatus inserted; the whole of the floor paved with Lowe's wood pavement in neat design; the windows have been reglazed, those at the west end being filled with coloured glass, whilst the chancel floor and sacarium has been paved with coloured tiles. Other very necessary work has been done, but much more remains to be accomplished in the way of re-furnishing, &c., before the original idea of a thorough restoration can be carried out. The contracts for the chief work—new roofs, floor, &c.—amounted to about 1,950*l.*

**Seacombe.**—The foundation-stone of the church of Our Lady and St. Joseph has been laid by the Roman Catholic Bishop of Shrewsbury. The building will be in Gothic style of architecture. The principal dimensions are as follows:—Length of nave and chancel 125 feet, to be extended to about 135 feet when the porches are built; width of nave from centre to centre of columns, 29 feet; width across aisles, 53 feet; height from floor to nave ridge outside, 60 feet. The hot-air heating apparatus will be supplied by Mr. John Grundy. The building is being erected by Mr. John Shaw, of Priory Street, Birkenhead, from the designs of Mr. Edmund Kirby, architect, 5 Cook Street, Liverpool. Mr. H. L. Whittingham is the clerk of works. The external walls will be of Liscard sandstone facings, with red Runcorn stone dressings to the aisle and

clerestory windows and all other door and window openings. The windows will be glazed with lead glazing, the ceiling of panelled pitch pine, the chancel walls and roof corresponding in height to the nave. There will be seating accommodation in the church for about 600 persons.

**Northampton.**—The restoration of All Saints Church has been taken in hand. Inside the decorative work is being done by Messrs. Smith Bros. The stonework, exterior and interior, will be carried out by Mr. Beardmore, and the painting by Mr. Goy. The east window is to be filled up by a large painting of the Crucifixion, which will be executed by Messrs. Heaton, Butler & Bayne. On either side of this will be painted the Decalogue, the existing form of which will be removed to the west gallery, where will also be placed the pictures of Moses and Aaron. The chancel itself will also be completely restored. The work is being done from the designs of Mr. E. Law.

## GENERAL.

**The Liverpool Arts Committee** have agreed to make a loan of pictures from the permanent collection for exhibition at Wolverhampton.

**Mrs. Warrington Wood**, widow of the late Mr. Warrington Wood, sculptor, has offered to the Warrington Corporation the whole of the original plaster casts of her husband's works. The casts will be conveyed from Rome at the cost of the Corporation.

**Mr. F. E. Kempson, F.R.I.B.A.**, Hereford, has been appointed surveyor of ecclesiastical dilapidations for the arch-deaconry of Monmouth. He was elected surveyor for the arch-deaconry of Llandaff in 1886, and is now, therefore, diocesan surveyor for the whole diocese of Llandaff.

**A Committee** has been appointed to carry out the restoration of Kettering parish church. The probable cost of the work is estimated by Mr. Blomfield to be about 7,000*l.*

**Mrs. Rushton**, of Bowden, has offered a sum of 2,000*l.* towards the erection of a church proposed to be built for the Peel district of Cloughfold.

**At Seville Cathedral** last week one of the pillars gave way, bringing away with it a portion of the roof, and destroying the organ. Two years ago attention was called to the dangerous condition of parts of the fabric.

**Mr. Doubleday**, of Colmore Row, Birmingham, has prepared plans for a first-class family and commercial hotel, which is to be built for Mr. G. Mountford, in Dalton Street, Birmingham.

**An Additional Building**, in connection with the Leeds General Infirmary, is to be erected at an estimated cost of about 30,000*l.*, to make provision for a medical children's ward, a casualty-room, and isolation wards.

**Mr. P. C. Lockwood**, after holding the post of borough surveyor of Brighton for thirty years, has sent in his resignation to the Town Council.

**The Design** of Messrs. Demaine & Brierley, architects, of York, has been selected for a new church and mission hall, for the newly-formed parish of St. Thomas, Kensal Town, London. The estimated cost is 5,500*l.* Five London architects were also invited and submitted designs.

**The Poplar Board of Works** have succeeded in obtaining a rule *nisi* calling on the East and West India Docks Company to show cause why a *mandamus* should not issue compelling them to rebuild bridges connecting the Isle of Dogs with the mainland.

**The Top Stone** of the steeple of St. Michael's Church, Coventry, has been replaced, thus practically completing the work of restoration. The height to the weather-cock is 303 feet.

**Messrs. Worthington & Elgood** have changed their address to No. 46 Brown Street, Manchester.

**A Roman Amphitheatre** has been discovered in a cornfield at Deutsch Altenburg, on the Danube. The state of part of the crop indicated a stony subsoil in the form of a circle, and excavations were made, which brought to light the uppermost gallery of an amphitheatre.

**The Devil's Bridge**, over the River Reuss, near Andermatt, fell in on Tuesday. The structure, a single arch of granite of 26 feet span, was constructed in 1830, 100 feet above the picturesque cascade.

**A Fire** broke out last week in a tenement at West Quay, Port Glasgow. The concentration of the sun's rays through a knob in the glass of one of the old windows is supposed to have caused the fire.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, AUGUST 10, 1888.

## TENDERS ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."*

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## COMPETITION OPEN.

## TRADE NOTES.

WE are glad to see that Messrs. J. B. Orr & Co., Limited, of 48 Cannon Street, E.C., have done an extensive work at the New Law Courts, Nottingham. Their Duresco has been used throughout the buildings with very great success, some four or five tons being employed.

A NEW small-pox hospital has been erected at Swinton, and special attention has been paid to the ventilation, Messrs. Robert Boyle & Son's latest improved patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

MR. JOHN GRUNDY, of 30 Duncan Terrace, City Road, London, and Tyldesley, Lancashire, has just been instructed to apply his patent warm air apparatus to heat the following buildings:—Crawthorne Church, Hants, under the direction of Mr. A. W. Blomfield, A.R.A.; Cork Lunatic Asylum, Mr. W. H. Hill, architect, Marlborough Street, Cork; Sherborne Abbey, Messrs. Carpenter & Ingelow, architects, Regent Street, W.; Hampstead Conservatoire, Mr. Rowland Plumble, architect, 13 Fitzroy Square, W.; St. Kevin's new Church, Dublin, Mr. T. Drew, R.H.A., architect, Dublin; Tiverton, for warming the Wesleyan Chapel, the Baptist Chapel, and Elm House; Seaforth, for warming the new Catholic Church, Mr. E. Kirby, architect, Liverpool; Haslemere Church, Mr. W. Penfold, architect, Westminster; Somerleyton Church, Mr. Horace Cory, architect, London; Halton Church, Messrs. Jeffery & Skiller, architects, Hastings.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his patent Manchester grates to the new Board schools, Castle Hill, Edinburgh. This makes the fifth school this year for the Edinburgh School Board which has been warmed and ventilated by means of Shorland's patent Manchester grates.

## WATERPROOFING MASONRY.

ASSUMING that the particulars of a process which absolutely preserves buildings from decay will be of interest to our readers, we give a few lines to the origin and merits of the process introduced to this country many years ago by Messrs. N. C. Szerelmey & Co., and now so successfully adopted. Colonel Szerelmey was an officer of Engineers in the Hungarian army, and during travels in Egypt in the pursuit of his studies concluded that some process must have been known to the ancients for preserving stone surfaces from corrosion and decay. He set himself the task of discovering such a process, and, believing he had succeeded, came to this country in 1855 to submit it to practical test. The time was opportune, for it was about two years after the completion of the new Houses of Parliament, and Sir Charles Barry, the architect, happened to be looking out for some method of preserving the stonework from decay, which had already begun to manifest itself, and also to preserve the ironwork of the roofs from rust. He examined many processes, and favoured Szerelmey's, but the matter being thought of great importance, the First Commissioner of Works availed himself of the best scientific assistance he could procure in an independent investigation. He employed Sir Roderick Murchison, then President of the Royal Geological Society, and the eminent Professor Faraday, and their conclusion, after an investigation extending over two years, was in favour of the Szerelmey process. They summarised its advantages in a report to the House of Commons in 1860. Professor Faraday stated:—"In my opinion the results of the trials (and I may say large experiments) made by Mr. Szerelmey are better than any of the rest, and, so far as one can form a judgment upon the experience of two years, justify the expectation that the process will sustain its character for a lengthened period of time." Sir Roderick Murchison added:—"I have no hesitation in saying that the process of Szerelmey is the best." The result was that the whole of the iron roofs of the House of Commons were painted with Szerelmey's iron paint, and a portion of the stonework was treated with his stone liquid. The Speaker's Court of the building affords very interesting evidence of what may be done in the direction of preserving stonework from decay, because the results of three phases of treatment may there be seen. The ashlar walls were thoroughly treated, and have been preserved; but the string course, which

FLOOR WITH GUTTERING

had previously been saturated with oil, thus preventing the stone liquid from having full effect, was only a partial success. Again, the porch of the Speaker's house, which was added after the other work had been completed, was not treated at all, decorative wash only being applied to it. This suffered very seriously from decay. The actual work done on Szerelmey's process is still uninjured by decay to the present time.

Many other buildings were also treated by the same process at the same time, and with considerable though not invariable success. If the process had not at that time reached perfection, it had, at any rate, shown capabilities worth development.

In 1875 the business came into the hands of the present owners, who at once applied their resources to the development of a material which should be free from objection, and which should be reliable. They aimed at the following points:—  
1. It must be capable of being applied to every kind of stone, without disfiguring it, and, if possible, without altering its appearance. 2. It must be incapable of chemical combination with the stone, for experience had shown that unless this condition was complied with the effect would be useless. 3. It must last at least ten years. 4. It must be easy of application. 5. It must be cheap enough for everyday use. These qualifications have all been attained, for the stone liquid is so simple that anyone can apply it, it is so cheap that everyone can use it, and it can be applied to stone, marble, or brickwork with equally good result.

The third qualification required a most important test—the test of time. Messrs. N. C. Szerelmey & Co. were willing to wait a ten years' public experience of it amongst their customers before claiming success. That period having elapsed, they wrote to their customers, asking for their verdict. Their reports are contained in a lengthy list. In every case it had given absolute satisfaction, and done everything that was expected of it. These reports include the names of several prominent architects.

The Szerelmey stone liquid under notice is a nearly transparent fluid, having a specific gravity somewhat less than that of water. When newly applied it gives the appearance of dampness. This is caused by a film which the liquid leaves upon the surface. In time this film recedes within the stone itself, where it forms an impermeable diaphragm. It is not, of course, possible to say how far it enters the stone, but probably never more than one-eighth of an inch. There is thus a surface of the stone exposed to the atmosphere which is found to harden in the natural way, but which never scales.

The action of moisture, necessary to produce scaling, is prevented by the impervious diaphragm.

Every colour of stone can be treated with the same liquid; and Messrs. N. C. Szerelmey & Co.'s offices at Mowbray House, Victoria Embankment, London, E.C., would be well worth a visit to inspect the numerous specimens of stone, bricks, &c., treated.

The important subject we have raised by this notice we hope will lead to our readers taking an interest in an invention which is open to their inspection and test.

### REGISTRATION OF PLUMBERS.

At the City Guilds Institute, Finsbury, last Saturday, an examination was held under the auspices of the Plumbers' Company for certificates of registration. The practical examination included various branches of leadwork, and the theoretical questions relating to the several subjects of plumbers' materials, house fittings, and sanitation. Plumbers attended from several districts of Middlesex, Surrey, and Yorkshire. The examiners were Mr. Charles Hudson, assistant chairman of the Registration Committee, and Messrs. Clarke, Gilbert, Millis, Nurse, and Webb. Seventy-five per cent. of those attending passed the full examination.

The system instituted by the Plumbers' Company in 1888 has, through the instrumentality of the Manchester and Salford Sanitary Association, been introduced into that city and district, and is now fully organised. The Council, of which Mr. John Holden, F.R.I.B.A., is chairman, and Mr. Fred Scott, secretary, consists of representatives in equal numbers of the public, master plumbers, and operative plumbers. The representatives of the public, appointed at a public meeting in the Town Hall, include the Mayors of Manchester and Salford, chairmen of the Health Committees, city and borough engineers, medical officers of health, the chairman and secretary of the Sanitary Association, architects, builders, and sanitary engineers. The masters and operatives also in public meeting selected their own representatives, and the Council are now prepared to carry out the work of registration in Manchester and Salford and a district of about thirty miles radius, except on the Liverpool side, where the district will extend only to Warrington, Liverpool being another centre. At the last meeting of the Council the first batch of applications were passed for nomination in the Plumbers' Company.

## THEATRE EXITS AND FIRE RISKS.

A GENERAL meeting of the renters or debenture holders in Drury Lane Theatre was held on Thursday last week in the saloon of the theatre, Major Sharpe presiding. The report of the architect stated that improvements of a considerable nature had been made with regard to the means of exit. The exits were now so numerous and conveniently situated that visitors might feel the utmost possible security. Before the meeting closed it was suggested that the electric light should be introduced into the theatre.

THE cost of the improvements just completed at the Prince of Wales's Theatre, Birmingham, will be over 2,000/. The auditorium has now been entirely cut off from the stage. A brick wall of exceptional thickness extends from the foundations to the roof behind the line of the proscenium arch, and the archway can be closed in ten seconds by a double asbestos curtain, with an iron framework weighing eight tons. Those dressing-rooms which extend beneath the pit and the boxes on the O.P. side are in like manner separated from the theatre by concrete walls, floors, and roofs, braced by short girders. The auditorium itself may now be emptied without haste in a very few minutes. The exits from the different parts of the house have been improved and additional ones constructed. From the gallery are two staircases, one of which, however, strongly built of stone and unusually broad, is much better than the other, and has only the demerit of emptying into the broad exit from the pit. All the doors are kept unlocked, open outwards, and, once thrown wide, secure themselves by a spring attachment from closing again. Behind the scenes the greatest changes have been made. The dressing-rooms, like that portion of the building to which the public is admitted, are separated by a brick wall and asbestos doors from the stage, and are served by an admirable staircase. Their floors are of concrete, laid with wooden blocks, and their fittings are coated with asbestos paint. Formerly the suite of dressing-rooms on the prompt side was not only a portion of the stage, and subject to almost immediate invasion by fire, but was served only by a narrow spiral staircase of wood. In the flies the gas-jets are covered with wire-guards, and the use of naked torches in lighting them has been discarded in favour of a system of automatic illumination. There is also a most elaborate provision of fire-extinguishing apparatus, and the scene-shifters are subjected to regular drills; also there is a direct telephonic communication with the Central Fire Station. The decoration

has been done by Mr. J. Seers, of Broad Street. The architect is Mr. W. Jenkins, of Bennett's Hill. The builder is Mr. Loud, of Selly Oak.

The Theatre Royal, Halifax, is to be reopened on the 20th inst. The alterations have been made from plans prepared by Messrs. Horsfall & Williams, Halifax, and Messrs. Milnes & France, Bradford, and will be carried out jointly by the two firms, under the superintendence of Mr. Williams. The dress-circle will be materially altered—the portion known as the back boxes will be swept away and converted into a crush room about 13 feet by 18 feet, out of which two doors will give access to the circle, which will be carried further back, and furnish extra accommodation. The present main entrance to the theatre will be used for this part of the house exclusively, and a new fireproof concrete staircase from the opposite side of the crush room will give access to the street in case of emergency. A new entrance is making for the pit, to run parallel with the one for the boxes, but divided by a thick brick wall, and the exit on the Shakespeare Street side will be cut off from the gallery entrance by a double brick wall, so the people from these parts will not meet until reaching the street. The new exit door on the Horton Street side will be considerably improved. The gallery is receiving particular attention—the present wood staircase is to be replaced by one of concrete, fireproof—and an exit is to be constructed at a low level on the Horton Street side, from which will run a commodious iron staircase. An iron balcony is also to be erected in front of the building, access being gained from the three windows at the top of the gallery. The stage is to be entirely separated from the auditorium by a 15-inch brick wall, extending from 12 feet below the stage to above the roof, the proscenium being closed by a double iron curtain, worked by hydraulic power, made by Messrs. Elkanah Hoyle & Sons. An iron fire-escape is to be constructed for the stage, and extra dressing-rooms provided.

FETES AT ANTWERP.—In commemoration of the freedom of the Scheldt, fetes will be held at Antwerp from Saturday, August 11, throughout the following week. On the night of Tuesday, the 14th inst., a Venetian water fête upon the Scheldt has been organised by the Chamber of Commerce of Antwerp, comprising a naval procession and general illuminations of the river. In connection with these celebrations return tickets have been arranged by the Great Eastern Railway at reduced rates *via* the Harwich route, available from the opening to the close of the festival.

## WATER SUPPLY WORKS.

ON Friday last the completion of the new storage reservoir of the Grand Junction Waterworks was formally celebrated. The company, whose present works are situated at Hampton, Kew Bridge, Ealing, Campden Hill, Kensington, and Kilburn, has a district of supply extending from Pall Mall to Sunbury, and the population supplied with water by the company numbers nearly half a million. The number of houses supplied is nearly 55,000, of which 42,000 receive constant service, and the quantity of water annually filtered and pumped into the district amounts to 6,300,000,000 gallons. The original supply of water for this company, which was incorporated in 1811, was taken from the Grand Junction Canal at Paddington. In the year 1819 the source of supply was removed to the river Thames at Chelsea; in 1835 it was taken higher up the Thames to Kew Bridge; and in 1852 it was again removed to the river Thames at Hampton. The storage reservoir is situated on an eminence called Mount Park Hill, and is designed to act as a reserve to meet any emergency caused by excessive drought, large fires, or other contingencies. Its surface extends over six acres, and, with a depth of 45 feet, it will contain 51,000,000 gallons of filtered water. It is lined with Portland cement concrete, and the slopes are paved with vitrified brick. The level of top water is 193½ feet above Ordnance datum, or more than 100 feet above the level of the ground of the Marble Arch, and the water will be supplied from the works at Kew Bridge through a line of pipes 30 inches in diameter. Messrs. John Aird & Sons were the contractors for the work.

On the same day was also inaugurated the new reservoir constructed on Addington Hills for the Corporation of Croydon. Messrs. Kirk, Knight & Co., of Sleaford, carried out the works from plans by Mr. Walker, borough engineer. The water is obtained from a well situate three-quarters of a mile south of Addington village. It is sunk in the chalk to a depth of 200 feet, the surface being 318 feet above sea-level. The storage capacity of the headings and the lower part of the well is about 502,000 gallons. A compound beam-engine of the Woolf type is employed to raise the water, its delivering power being 77,760 gallons per hour. The reservoir will hold 5,000,000 gallons. Its overflow level is 465 feet above sea-level. The total length of mains laid is about 13¼ miles. Last year the consumption of water averaged 2,255,327 gallons per diem. The district for domestic supply is the area of the borough within a two-mile radius from the Town Hall, with about 75,000

people. Luncheon was afterwards served. After the customary loyal toasts, the Mayor went at length into the work done by the Corporation, and spoke of the open spaces and recreation grounds, of the fact that they had learned the secret of ventilating their sewers above the people's heads instead of under their noses, how they had spent 27,700*l.* improving their foot-paths, purchased a freehold farm for irrigation purposes at a cost of 52,000*l.*, widened bridges, spent 3,500*l.* on baths, and how, although they had expended in all 147,000*l.*, the rates were lower than in the days of the old local board.

## THE SANITARY REGISTRATION OF BUILDINGS.

THE Bill dealing with the better sanitation of dwelling-houses, schools, colleges, hospitals, factories, workshops, hotels, lodging-houses, and other buildings within the United Kingdom, prepared and brought into the House of Commons by Dr. Farquharson, Sir Henry Roscoe, Sir Guyer Hunter, and Dr. Cameron, entirely meets with our sympathy, says the *Lancet*, in so far as its general aims and principles are concerned. But we fear that in some of its details it will be found open to objection. The compulsory establishment of "sanitary registration authorities" throughout the kingdom is a most important step, and calls, above all things, for a competent staff of experts in order that justice may be done to the public. An attempt is made to secure such a staff by the initiation of examinations under certain bodies. These include the Royal Institute of British Architects, the Institution of Civil Engineers, the Institute of Architects in Ireland, the Association of Municipal and Sanitary Engineers and Surveyors, and the Surveyors' Institution; but it will be most unfortunate if all these bodies become competing authorities for the issue of certificates in sanitary practice. And if anything is done in the matter an effort should be made to secure a combination of these authorities for the purpose of a single certificate having uniform value. But pending the inauguration of the examinations in question, the Local Government Board are to be required to grant certificates to a body of individuals, some of whom are not really competent, and who will acquire the right to hold a Government testimonial of their fitness merely because they happen at the time of the passing of the Act to hold a certain office, which they have secured without any evidence of their competency to fulfil it. We more than doubt whether the Local Government Board will consent to be placed

## THE FIRE AT THE GRAND THEATRE.

The destruction of this fine Building might have been PREVENTED by the USE of GRIFFITHS' "PYRODENE," which would have made the WHOLE of the SCENERY, STAGE, and its SURROUNDINGS—in fact, THE THEATRE in every part—ABSOLUTELY NON-INFLAMMABLE.

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE.

NON-POISONOUS.

ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

## RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIR.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIR.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly,

To Messrs. Griffiths Bros. & Co., London.

S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C., LONDON.

in such an invidious position; and we are inclined to think that, having regard to the small number of surveyors, &c., who are well grounded in sanitary knowledge, the Bill should have been tentative in the first instance.

#### PURIFICATION OF THE THAMES.

ALLUDING to a notice in the *Times* of July 26 of a visit by the Society of Engineers and experts to the new sewage-precipitating works for the northern outfall at Barking, Sir Robert Rawlinson writes:—The notice is headed, "The Purification of the Thames." My experience would compel me to substitute the following heading, "For the Continued Pollution of the Thames." The Greeks are reported to have said, "Whom the gods intend to destroy they drive mad." With regard to this sewage-purification question, the Metropolitan Board have on this question gone mad from their beginning, the works they are now prosecuting being the ultimate passion of madness. When the Metropolitan Board was established Parliament put upon them, as its prime duty, the purification of the river Thames, and to this end at first they consulted many of the most eminent chemists of the day as to the use of chemicals for precipitation of the solids and purification of the fluids. To make a long story short, the common results were that no chemicals purified sewage; that the best left seven-eighths of the salts of sewage in the clarified water, *plus* some of the chemicals; and that the clarified fluid, when passed into small streams or rivers, would ferment, become putrid and offensive—these being the results, whatever chemicals or precipitants were used. In some small places, where there is a stream having a swift current, and it is in the country, chemical clarification, when well attended to, is allowed. In other cases, chemical treatment, with subsequent land filtration, is allowed. But at Liverpool the great tidal estuary receives and disperses the whole of the crude sewage. The case of London is exceptional. An enormous population, fully sewered, and having not less than 1 million water-closets or soil-pans, from which excreta to the extent of 12½ millions of pounds every day is poured into the sewers and into the river at a point some ten or twelve miles below London, and some fifty miles from the sea, the tides flowing up and down past the great sewage outfalls and past London each day, constitute a vast difference.

But to the conditions imposed from the first on the Metropolitan Board by Parliament. These were, in short, to remove the

entire volume of sewage from the Thames in such a manner as should effectually free the metropolis from its sewage day by day, and the river Thames from pollution, neither of which has this most unfortunate Board done. At the outset of their work there were many projectors in the field, professing to have at command modes of dealing with sewage so as to purify it at a great profit. There were also persons who professed themselves willing to take the entire volume of sewage down to the Maplin Sands, and there to use it, pouring any surplus into the sea. Surveys and plans were made for sewage conduits to convey the entire volume of sewage, north and south, to land or to the sea, at no cost to the Metropolitan Board. These baits proved so tempting that the Board allowed itself to be turned from its true duty and to try, by negotiating with outside parties, to relieve itself from the obligation for which it was principally called into existence, namely, to embank the river through the metropolis, complete the main drainage, and purify the river, this latter being the crowning work, without which the other expenditures would be in a great degree waste of money.

Before embarking in these enormous works now on hand, the Board cannot have informed itself of the position of the sewage question at this day. I must assume that they do not know what good progress has been made in the use of sewage when applied to land in broad irrigation in England and on the Continent, where the entire sewage of the town is disposed of year by year and all the year round so as not to be a nuisance. There are sewage farms in England sufficient to convince any open-minded persons that where land can be acquired for broad irrigation the problem of what to do with sewage is solved. But on a very large scale, out of England, there is Berlin, where, by pumping, sewage is distributed all the year round over some thousands of acres of land with perfect success, and that which is done for Berlin may be done for London.

Between the metropolitan sewage outfalls and the sea sewage conduits may traverse fifty miles of agricultural land, opening out from 50,000 to 100,000 acres of land hungry for sewage, which, if applied, would find employment for thousands of labourers, and add fivefold to the productiveness of the soil.

The Metropolitan Board say that they are carrying out the recommendations of Lord Bramwell's Commission. I say they are not, and I am in a position to say that I know they are not. But, apart from all dispute and argument, time will show that the 50 acres of sludge-tanks and works will be 50 acres of an abominable nuisance; that the mud barges will be costly

incumbrances to the river; and that the working expenses will be enormous, and all waste. The sewage of the metropolis cannot be less than 200 million gallons per day. The new works are to treat 90 millions of gallons per day. What is to be done with the 110 millions over and above? If this moribund Board had been well advised it would not so recklessly have plunged head over ears into the present costly mess, in the face of all previous warnings and of the recommendation of the last Royal Commission, especially appointed to take evidence and to report upon this notoriously vexed question.

How the Government can have permitted it is difficult to imagine. Recent inquiries and revelations must, however, show that wisdom does not dwell in Spring Gardens.

#### EXTENSIVE SALE OF BUILDING SITES AT FRINTON.

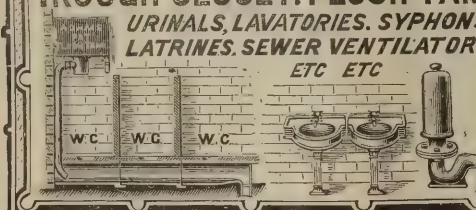

ON Monday, the 30th ult., Mr. Richard J. Collier, of Milner's Buildings, Finsbury Pavement, conducted a large sale of freehold building land at Frinton, the new seaside resort on the east coast, situated between Clacton-on-Sea and Walton-on-the-Naze, at which an estate of upwards of 100 acres in extent has been purchased by the Marine and General Land, Building and Investment Company, who have laid out the estate for building upon, several new roads having been formed, together with an esplanade facing the sea upwards of a mile and a half in length, in front of which is a spacious turfed promenade running the entire length of the esplanade. The estate stands upon high ground, considerably above the beach or shore, with a commanding view of the German Ocean. Already several high-class houses have been erected along the esplanade frontage, and also in several of the new roads, whilst building is now going forward on different parts of the estate. The Tendring Hundred Water Company, whose district includes Walton-on-the-Naze, Clacton, and several surrounding parishes, have nearly completed the laying down of water-mains along all the newly-formed roads, and amongst other works to be carried out is an ornamental pier, and also a sea wall running the full length of the cliffs and esplanade. A special train from Liverpool Street took a numerous party to Frinton to attend the sale, and the rain having cleared off, with a charming sunshine, the visitors, on arriving at their destination, inspected the newly-formed marine locality, large numbers parading the promenade and esplanade for some hours previous

to the commencement of the sale, which took place at the recently-erected Queen's Hotel. The plots offered were ninety-seven in number, including several shop plots and a large hotel plot facing the sea. The plots submitted were all unusually large ones, varying in their frontages from 30 to 120 feet, and in depth from 100 to 170 feet. On the sale commencing, the biddings became close and spirited, and a large proportion of the plots offered were sold at prices ranging from 30% for the smaller lots to 60%, 80%, and 100% for those having a larger area. The plots on the East Cliff, facing the sea, and situated on that part of the estate described as the Crescent, having frontages of 100 feet and depths of 170 feet, were sold for 125% each. For the large hotel plot, facing the West Cliff, having frontages of 200 feet, 410% was offered, but being below the reserve was bought in at 450%. An angular plot, close to the sea, containing 3½ acres, and described as suitable for a lawn-tennis ground, was sold for 395%. The total proceeds of the day's sale amounted to 2,400%.

#### INCORPORATED TRADES OF CALTON.

THE management and administration of the properties of the ancient Barony and Incorporation of Calton were, the *Scotsman* says, formally transferred to the Edinburgh Town Council on Monday, when a meeting of the Town Council Committee took place. The meeting was presided over by Baillie Turnbull. Among the articles laid before the meeting were—(1) Ram's horn mounted as a snuff-mull, having the Incorporation arms engraved on a silver plate, and surrounded with silver bands bearing the names of the Conveners since 1810, when the horn was presented to the Incorporation by Mr. Simon Cunningham; (2) large and handsome table snuff-box, in silver, with gold plates on top, bearing the City arms, &c., an inscription on the box intimating that it was presented for the use of the Con- vener, and as a mark of respect, on occasion of the formal opening of the Convening Hall, on April 15, 1819; and (3) the Seal of the Incorporation. In this connection mention was made of the following properties now in the Convening Rooms as worthy of the attention of the Town Council:—1, Lord Balmerino's chair, a fine specimen of the antique, in perfect preservation and order; and 2, the three official chairs, in Spanish mahogany, having the arms of the various trades beautifully carved by the late Mr. John Steell. Although in one aspect the proceedings involved the handing over of pro-

perties of comparatively little importance, consisting chiefly of the burying-grounds in Waterloo Place and in Regent Road and the Convening Hall and Rooms, yet the transaction is significant as the closing act in the history of an institution venerable by antiquity, and surrounded by many interesting associations. The Incorporation was originated by Lord Balmerino, the owner of the estate and barony of Calton or Caldtoun, and dated back to 1631. For many long years the community living within the bounds of the barony led an isolated existence as a barnacle burgh attached by locality and interests to the city—exercising rigidly the rights of exclusive trading, and managing all their own affairs (municipal, police and parochial) by means of the Baron Baillie and the officials of the Incorporation; but the sweeping away of a large number of dwelling-houses and other buildings in 1814 to make way for the new Calton Road and Bridge, the change in public feeling consequent on the advance of Liberal notions, and, finally, the passing of the Act of Parliament of 1846 repealing the right of exclusive trading, wrought a great change in the Incorporation, and the body has since existed very much as a territorial mutual benefit society, which during the whole course of its career, as well as in its closing years, has conferred many and substantial benefits on its members, their widows and children. The membership having become all but extinct, and the last widow having dropped off the roll, it became necessary for the Incorporation to take steps for transferring the management and administration to some body having perpetual succession, and the Town Council are now taking over all its properties and becoming responsible for its obligations. The circumstance of the grounds having been so long used for cemetery purposes demands their suitable maintenance and upkeep in all time coming. The hall and grounds occupy prominent positions, and form important architectural features in the approach to the city from the east, and they cannot be in better hands, as securing the amenity of the city, that in the custody of the Town Council. There is, too, a peculiar fitness in the properties falling into the hands of the Town Council, the superiors of the old barony and proprietors of the lands of Calton, which they purchased in 1724 from John, Lord Balmerino, and James, Master of Balmerino.

As many citizens and others have private tombs and spaces and are otherwise interested in the grounds, it will be satisfactory for them to know that their rights of interment are in no way interfered with; their case formed one of the special points stipulated for by the Incorporation. The following

names may be taken as representatives of the several classes of the now silent denizens of the grounds:—Of civic dignitaries there are Lord Provosts Allan, Alexander Henderson, and Kincaid Mackenzie, besides a long line of bailies, town councillors, and municipal functionaries; John Sinclair, town clerk of Edinburgh, and clerk to the ancient barony of Calton; Isaac Bayley, of Manuel, long clerk to Heriot's Hospital; and Archie Campbell, principal city officer—a figure of such importance in his day as to be immortalised in "Kay's Portraits." The Church of Scotland is represented by Dr. David Ritchie, of St. Andrew's Church, and Professor of Logic in the University; the Free Church by Dr. Candlish (who is interred in his father's tomb in the old ground); the Episcopal Church by Bishop Teviot; the United Presbyterians by Dr. John Brown and others; and the Roman Catholics by their tomb in the new ground, in which are interred the Rev. Alexander Gordon, a man of great erudition, and others of their clergy. Law and Justice are represented by the following Lords of Session:—Sir William Miller, of Glenlee, and Lords Gillies, Ivory, and Adam Gifford. Medicine has some illustrious names—Professor Sir Robert Christison (interred in the tomb of his father, Professor of Humanity in the University), Dr. James Begbie, Andrew Fyfe, surgeon, and his son Dr. Andrew Fyfe, Professor of Chemistry; Dr. Adam Warden, Aurist to the Queen; Dr. George Wilson, Lecturer on Chemistry and Professor of Technology; and Professor Dick, founder of Dick's Royal Veterinary College, who, and his father before him, were members of the Incorporation. Literature and art embraces the names of Baron Hume, the historian; Dr. John Brown, author of "Rab," &c.; Archibald Constable and Blackwood, publishers; David Allan, historical painter; and Robert Stevenson, C.E. Histrionic art is supported by the names of William Woods, who at the beginning of this century was the leading and favourite actor on the Edinburgh stage; and Charles Mackay, who, as his stone indicates, was better known as "Bailie Nicol Jarvie." There is a strong list of architects, and several of them were members of the Incorporation—Robert Burn, David Bryce, David Nisbet, John Neill, Robert and Richard Dickson, Lewis Alexander Wallace, and Charles Macgibbon. The profession of arms is upheld by many noble sons of old Edinburgh who distinguished themselves in the various branches of the service.

Their good swords are all rust,  
Their bodies gone to dust,  
Their souls are with the saints, we trust.

## BREWERY ENGINEERING.

At the Congress of the Institution of Mechanical Engineers in Dublin last week, Mr. Samuel Geoghegan, engineer to Guinness's Brewery, read a paper on the tramways and rolling stock in the establishment. As the business of the establishment increased, it became necessary to extend the premises, and the ground which lay between James's Street and the Liffey was purchased in 1873 with the view of bringing the brewery into direct communication with the port by means of steam barges. The traffic, not only within the old and new premises, but also between them and between the new premises and the river and the railway terminus, was effected by the construction of a double system of tramways, namely, a tramway of 5 feet 3 inches gauge, the same as the Irish railways, for communicating with them from the new premises, and a tramway of 22-inch gauge for the work within the brewery, and for communication between the higher and lower premises. This narrow-gauge tramway and the rolling stock for working it form the special subject of the present paper. The working of the broad-gauge waggons with a narrow-gauge engine, developed by the requirements of the traffic, is novel, and may be considered under the four following heads:—1. Design of line; gradients and curves. 2. Permanent way; points and crossings. 3. Rolling stock; locomotives, waggons, and haulage trucks. 4. Traffic and signals. In designing the line the author set himself to comply with the following conditions:—That as far as possible all the traffic within the brewery should be worked by steam power; that the levels should be connected by gradients not exceeding 1 in 40, and with as easy curves as practicable; that the weight of the engines should be as great as could be obtained upon their limited wheel-base, as the loads to be hauled were considerable, and in addition the gradients were heavy, the curves sharp, and the wheels small; and that the rolling stock should be of as great a capacity as a width of 5 feet and a headway of 6 feet would admit. The first difficulty was the difference of level to be surmounted within a limited area. To meet this a hydraulic lift had at first been employed, by which the waggons were raised or lowered, one by one, between the two levels. This was a slow and costly process, involving the separation and making up again of the trains. A great advantage would accrue from connecting the two levels, without exceeding the set gradient of 1 in 40. To meet these conditions a spiral tunnel might be constructed, and proved to be perfectly feasible. The height of the tunnel is 7 feet 3 inches

from the rails, the width 7 feet 10 inches, and the thickness of arch 18 inches. A short connecting tunnel was formed at the bottom by driving a heading and lining with brickwork in the usual way.

On issuing from the tunnel at the top the line takes a short stretch to the left, forming a junction with other lines; and then returns, passing again over the tunnel in the open, thus forming a third lap; and finally runs out on the level of the brewery yard about 35 feet above the rail level at the bottom entrance to the tunnel. The remaining 15 feet of rise, from the quay up to the bottom of the spiral, is effected by means of a zigzag incline from the quay up to the mill stream. This road crosses the mill stream twice, continuing the incline by a small brick viaduct up to the bridge over Cooke's Lane. The bridge is on the same level as the entrance to the tunnel under James's Street. For the sake of quickness and convenience in working the line is constructed with curves, no points being used; so that a train can be run from the lowest to the highest level, and over the whole extent of the premises, without shunting or changing the engine to the other end of the train. On the small line the permanent way has undergone some changes, more particularly at those parts where it has been laid with rails above the ground level, which has been done at places where there is not any horse traffic or much other traffic. The first rails were as light as 16 lbs. per yard, and the weight has since been increased to 46 lbs. per yard. In the laying out of the line, triangles have been so worked in as to form easy means of turning a train whenever required, without uncoupling. Owing to the small radii of the curves in the triangles, very little ground space is occupied for this purpose. Both narrow and broad-gauge roads are now entirely without turntables, with the exception of one only, which is used for placing the engines and waggons over their pits in the running shed. As there is horse traffic over the broad-gauge rails on which the railway waggons run, these rails are grooved, and the waggons run on the flanges of the wheels in the grooves instead of on the tread, thus keeping the tread of the wheel well clear of the pavement and avoiding the use of a guard-rail.

The total length of the line is about four and a half miles. At first the points and crossings were made out of the rails themselves, as on the broad-gauge railway lines. But experience soon demonstrated that, in order to make a good permanent job, they must be something more than a mere reduction in proportion from the sections used on broad-gauge lines.

MOSAIC & ENCAUSTIC.

**MOSAIC & C.**

The present rolling stock comprises nine locomotives and 177 waggons. The first locomotive ordered weighed only about two tons, and is suitable only for light work. It has the defect that, owing to the gearing being so close to the ground, it is very difficult to keep in order when working full time. Geared engines were then procured, weighing about five tons, and, owing to their increased hauling power, were found very useful; but the absence of springs rendered them costly in repairs and hard on the road. They were also slow in speed, and somewhat troublesome in starting. The next class, weighing six tons, and having outside cylinders, proved better adapted to the traffic. They have circular ends for foot-plates, and have also water tanks for condensing the exhaust steam. The motion being all outside, made it very accessible for cleaning and repair; but being so near the ground it got very dirty, and the wear on this and on the horn-plates from the same cause necessitated very frequent adjustment. The difficulty in finding an engine suitable for the duties required was overcome by designing an entirely new form of engine, which should combine the best points of each and avoid their defects. A good arrangement with springs could be made by placing the cylinders and crank-shaft horizontally above the boiler, and the motion could be communicated through vertical coupling-rods from the crank-shaft to the main driving axle, the upper and lower axle boxes being connected together by a link which would keep the centres at a fixed distance.

In the carrying out of this design sundry difficulties presented themselves. The first of these was the connecting together of the upper and lower crank-pins in such a way as to allow for the oscillation of the two shafts due to defect in the road, without interfering with the true bearing of the brasses on their respective pins. The question arose how much oscillation it would be necessary to allow for; and it was considered that a play of  $\frac{3}{4}$  inch would be sufficient to allow. In the inclined position due to this amount of play, it is astonishing how much out of line the two shafts appear. To overcome this difficulty the author adopted the expedient of thinning down the ends of the coupling-rods near the crank-pins, so as to allow of their springing, while at the same time making them sufficiently broad to retain the necessary sectional area for strength. The second difficulty was the adjustment required for the wear that was likely to take place in the top axle-boxes, owing to the thrust of the vertical coupling-rods, in addition to that due to the forward and backward thrust of the pistons. This has been overcome by the arrangement of brasses. As

the vertical and horizontal thrusts, and consequent wear, are on the whole about the same, the side cod-pieces are made to a right angle, so that when adjusted they close in the bearings equally both vertically and horizontally. A third difficulty was how to avoid the use of horn-block guides, which had been found to be a constant source of trouble and expense. The pull of the engine, the side oscillation, and the thrust of brake-blocks had all to be provided for. The arrangement adopted has been found to get over this difficulty. The axle-boxes of the carrying wheels do not slide in horn plates in the usual way, but have vertical play to the extent that the spring-frame will allow; and the brass linings are turned as parts of a cylinder, for allowing the axles to adjust themselves in case of an unequal lift on either side of the engine. This bogey has to transmit the pull of the drawbar only, and not the forward and backward pressures from the pistons.

A manufacturing firm is differently situated from a public carrying company in having to provide only waggons adapted to its own requirements, which are more clearly defined and more easily ascertained than when the wants of every description of traffic have to be met. In the case of an existing establishment where the old buildings were not laid out for such a contingency as a railway, the necessarily sharp curves and narrow openings, and probably low headways, will very much affect the design of rolling stock. In the present instance 5 feet in width, 8 feet in length, and 6 feet in height, on a wheel base of 3 feet, were the limits not to be exceeded with the four-wheel tip waggons. The object of this arrangement is to get as large a body as possible, and at the same time a sufficiently great angle for the complete discharge of the load. When loading with materials to be shovelled from the ground level, the fastenings are pulled out of the catches by the chain at the side opposite to the loading; and a slight additional pull causes the rollers to rotate, which they readily do, being urged by the extra weight of the upper part of the body. For discharging a load it is only necessary to pull the chains attached to the spring catches until the body is released, and then to give it a slight tilt; and as the centre of gravity is high, the body will tip itself over until the springs are caught by the top of the frames, in which position the sloping side of the waggon gives a sufficient angle of discharge for all brewery materials or products. In addition to these four-wheel waggons for carrying in bulk, waggons are also required for the larger materials which could not be accommodated on four wheels with such a short base. For this traffic a platform waggon mounted on two

bogey frames is used. Its weight is about 28 cwt. The bogey is made simply of two longitudinal timbers resting on the axle-boxes, with a piece of transverse plate bolted across, to which is rivetted the centre carrying the platform beams. It was thought advisable to put in side rollers, so that in case of excessive load on either side the roller will come into play. The coupling bars are at the same height, and the same in every respect as those used on the four-wheel waggons, and are fixed to the bogeys and not to the body of the waggon.

The haulage truck is an apparatus designed to enable the existing small engines to be employed, thus saving the expense of two shunting locomotives of the 5-feet 3-inch Irish gauge, and avoiding the need of a second shed. It was considered that for the slow speed required one of the small locomotives would be quite equal to the work to be done, and thus far the plan is found to answer its purpose well. The engine is lifted by hydraulic power upon a broad-gauge haulage truck having four wheels, on which the wheels of the engine rest; and on the counter shafts carrying these wheels are pinions, gearing into spur wheels on the shafts of the truck carrying wheels. The total traffic at present is about 1,500 tons per day. In most cases the roads have been laid out at the brewery with the view of working in circuits.

Signals are scarcely needed with such slow speeds and short runs, and are used in only two places, namely, a little outside each end of the spiral tunnel. The following will explain the working:—First, should a driver entering at one end find that the lever at his end is over with the weight looking towards him, he knows that the line is blocked, and he waits till the driver who has blocked it clears it again, which is done on leaving the opposite end from that at which he entered by catching the hanging rope attached to the wire. The pulling of this stretched wire, which is done while the train is in motion, will pull over the blocking lever at the entering end, and will thus clear the line, which cannot be effected by pulling at the lever itself at the outgoing end of the line. The driver who has been waiting then follows, having first blocked the line again himself at the entering end. Second, should a driver coming to the signal find that the lever is apparently in "line-clear" position, he tries to block it; but should he be unable to pull it over, he knows that there is some one coming in the opposite direction who has thrown the opposite lever over to block. He then backs into a siding to get out of the way of the driver coming in the opposite direction, who when he comes to the rope hanging from the stretched wire catches it and so clears the line.

The first driver then throws his own lever over to block and proceeds. Third, should two drivers come to the signals at the same time, one at each end of the line, then whoever pulls his lever over first has got the road to himself. As the men know that their situations, and perhaps their lives, depend on the regular working of the signals, there is found to be no trouble with them. In the case of local traffic, like that of the cask-washing and the removal of grains and malt, a conductor accompanies the train, shifting the points and signalling with the flag; and when passing through the public thoroughfares he carries out the requirements of the Board of Trade and other public authorities.

#### EMPLOYERS' LIABILITY.

AN action has been brought by a workman named Pearson, of Hoole, in the Chester County Court, against Messrs. Neill & Sons, of Manchester, contractors, who had the contract for building the new goods station at Chester. In November last the workmen were engaged excavating foundations, and in order to keep the banks from collapsing they drove in piles. At first the piles were driven in with a hammer, but as this destroyed the timber iron caps called "dollys," to fit on top of the planks to prevent them being damaged while being driven, were used. Four men were engaged at the pile-driving, two being in the hole and the other two on a platform, the one striking and the other holding the "dolly" on to the top of the post. On the occasion in question the plaintiff was in the hole, and the workman had struck a blow at the post and was raising the mallet again when he knocked a "dolly" off the next post, and it fell on Pearson, who sustained such injuries that he was still suffering from nervous shock. After the accident the defendants had a rope fastened to the "dollys," so that if they were knocked off the top of the posts they would not fall more than a yard. The Judge said it would be a very dangerous thing to lay down that, because the defendants took steps to prevent a recurrence of the accident, they thus admitted their liability. The machinery was undoubtedly defective, because fastening a rope to the "dolly" made it effective. The minds of the employers were open to the dangerous nature of the plant, because they gave orders that the "dollys" were to be held on while the post was being driven, on pain of instant dismissal of the workmen. He therefore thought there was a defect in the machinery, and he thought it involved negligence; therefore

MAKERS TO HER MAJESTY, BY SPECIAL APPOINTMENT A.D. MAY 13, 1876.

## STEEL STRONG ROOMS, DOORS, LOCKS, AND SAFES

TO THE BANK OF ENGLAND AND ITS BRANCHES,

*Including the New Law Courts Branch now in course of Erection.*

### IMPORTANT COMMUNICATION.—WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration of the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all the proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebattd Doors for all the par walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed)

WILLIAM WHITELEY.

he should give judgment against the employers for 75% and costs, and stay execution for a month on payment of 10% to the workman.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

10876. William Hardcastle, for "Attaching lines, cords, or chains to window-sashes, shutters, and lifts." July 27, 1888.  
10880. James Gush, for "Improvements in the method of fixing sliding windows in their casements to facilitate cleaning from the inside." July 27, 1888.  
10960. Edw. Tippell Newton, for "Improvements in and relating to surveying and levelling instruments." July 28, 1888.  
10990. Charles Shewbrooks, for "Improvements in the construction of roofing tiles." July 30, 1888.  
11001. Sidney Turner, for "An improved instrument and apparatus for use in the mechanical reproduction of writing, drawings, and other delineations." July 30, 1888.  
11019. Walker Moseley, for "Improvements in electric bells." July 30, 1888.  
11027. Robert Muir Petrie, for "An improvement connected with draw and push bolts for furniture, doors, windows, and the like." July 30, 1888.  
11029. Ann Knevet, for "Improved apparatus to be used in connection with domestic firegrates." July 31, 1888.  
11030. Joseph Pulsifer, for "A mechanical sketching device for artists." (Complete specification.) July 31, 1888.  
11056. George Forbes, for "An appliance for increasing the draught in boiler chimneys." July 31, 1888.  
11085. Richard Isaac Kiln and Charles Henry Kiln, for "Improvements in roller blinds and fittings therefor." July 31, 1888.  
11093. Henry Harrington Leigh, for "An improved automatic fire alarm." (Complete specification.) July 31, 1888.  
11219. William Perry and William Henry Reed, for "Improvements relating to roofs or covers for ricks and the like, to scaffolding, and to means for raising and lowering the same." August 2, 1888.

11223. Thomas Mace Cannon and James Osborn, for "Improvements in or connected with dust-pans." August 2, 1888.

PROVISIONAL SPECIFICATIONS ACCEPTED.

17261. William Henry Hazlewood, for "Improvements in blind racks." December 15, 1887.  
4787. William Rabbit, for "Improved automatic apparatus for extinguishing fire." March 29, 1888.  
5808. Archibald Campbell Ponton, Benjamin Lewin Moseley, and Crompton Chambers, for "Improvements in the manufacture of artificial marble, granite, or other stones." April 18, 1888.  
9377. Ralph Edwin James and Alfred Haley, for "Improvements in apparatus for heating water for bath and other purposes." June 27, 1888.  
9442. Mark John Lansdell, for "An improvement in the manufacture of set squares, T-squares, and other analogous appliances." June 28, 1888.  
9648. Joseph John Phillips, for "An Improved sanitary trap gully for streets and other places." July 3, 1888.  
9788. James Higson Jolly, for "Improvements in and connection with locks." July 5, 1888.  
9792. Walter Stephenson, for "Improvements in door-closing apparatus and door-checks." July 5, 1888.  
9826. Isaac Kirkbride, for "Improvements in apparatus for raising or lowering window sashes, and holding them in any desired position." July 6, 1888.  
10180. Joseph Henry de Fonseca, for "Improvements connected with water-closets and urinals." July 13, 1888.  
10308. John Turner, for "Improvements in smoke-consuming apparatus." July 16, 1888.  
10331. Robert MacIntyre, sen., for "Improvements in preventing or consuming smoke, and in economising fuel in steam boiler and other furnaces or fires, and in apparatus connected therewith." July 17, 1888.  
10467. George Holmes, for "Improvements in night latches and other spring locks." July 19, 1888.  
10473. Julius Schlesinger, for "Improvements in the manufacture of cement." July 19, 1888.  
10673. Richard Wright, for "Self-locking window-sash fastener." July 24, 1888.  
10715. William Henry Luther, for "Improvements in the construction of corrugated sheet metal for roofing, and such like purposes." July 24, 1888.

## COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

13258. William Henry Dutton, for "Revolving door-post or other revolving posts for public buildings or theatres." September 30, 1887.

13782. George Willsmere, for "An improvement in dust-bins." October 11, 1887.

9234. John Howard Cartland, for "Improvements in the manufacture of bolts for doors and other similar purposes." June 25, 1888.

9271. Alfred Coleby Ernery & Wm. Henry Tylor, for "An improved appliance for use when jointing pipes." June 25, 1888.

9532. John Rippon, for "Improvements in the manufacture of fire-lighter." June 30, 1888.

## PATENTS SEALED, AUGUST 3, 1888.

3950. John Insham, for "Improvements in or relating to domestic fireplaces." March 16, 1888.

5591. For "Improvements relating to apparatus for operating hydraulic lifts or elevators." April 16, 1887.

7835. Joseph Sinclair Fairfax, for "Improvements in boilers, flues and furnaces, and in the plates used in constructing the same." May 28, 1887.

9398. George Edwards, for "Improvements in expanding apparatus useful for fire-escapes, scaffolding, ladders, observatories, piers, pontoon and other bridges and the like." June 11, 1887.

9694. Fredk. Wilfrid Scott Stokes, for "Improvements in the continuous manufacture and burning of cement." July 11, 1887.

10042. Alfred Julius Boulton, for "Improvements in or relating to roofs and roofing material." July 18, 1887.

10132. Henry Lewis Doulton & Mark Marshall, for "Improvements in the manufacture of spiral tubes, rods, pedestals, chimney-pots, architectural moulding and such like articles of terra-cotta or other earthenware, and in apparatus to be used for that purpose." July 19, 1887.

## ABRIDGMENTS OF SPECIFICATIONS RECENTLY PUBLISHED.

"Automatic door closer and check." No. 12291. 1887. William Frazer, 49 Oxford Road, Finsbury Park.

*Claim I.*—Combining with a concealed door-spring or check, or a door-spring and check combined of hinged or knuckle flaps, jointed as described and represented; which are firmly secured to a door and door frame, and with a knuckle snug of the one part passing through a gap of the other part. (Eight other claims follow.)

"Improvements in fireproof curtains for theatres and other buildings." No. 12328. 1887. A. Melville, Grand Theatre, Birmingham. This invention consists of composing the curtain of slag wool (silicate cotton), which is stiffened by wire netting or such-like contrivance placed either on one or both sides of the slag wool. When wire gauze is used the slag wool may be interwoven with it.

*Claim I.*—The use of slag wool (silicate cotton) in any form for fireproof curtains.

*Claim II.*—A fireproof curtain constructed of slag wool (silicate cotton) in combination with wire netting, &c.

"Draught-proof reversible window." No. 8011. 1888. W. W. Clayton, Nydd, near Ripley, Yorkshire. This invention is to prevent draught in windows where the two or more sashes are in the same vertical plane and open on pivots. When closed these sashes are fixed tightly together and to the frame by means of a rack fixed in the frame.

*Claim I.*—The way in which reversible window sashes are secured and rendered draught-proof by means of racks, as shown on drawings.

*Claim II.*—Making the sashes to shut one immediately above the other so that they are in the same vertical plane, and made damp-proof, as set forth on drawings.

*Claim III.*—The mode of holding open the sashes at any angle by means of the spring lever peg or alternative fastening, as shown on drawings.

"Improvements in ventilating apparatus." No. 8385. 1888. J. McConachy, 53 Ardgowan Street, Port Glasgow.

*Claim I.*—A ventilating panel constructed substantially as described, &c.

*Claim II.*—A ventilating shaft provided with improved ventilating panels at its upper part, and divided internally by radial partitions substantially as hereinbefore described, and as shown on fig. 4 of the accompanying drawings.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

AT last week's meeting of the Bath City Council, Mr. RADWAY, one of the councillors, stated that Major DAVIS, the city architect, had given copies of his papers on the Arms of Bath to *The Architect*. The meaning of the assertion was, we suppose, that Major DAVIS had incited this journal into opposition against the Council. The councillors may possess some means of discovering what is done inside the houses of Bath, but if Major DAVIS was observed making up a parcel of his writings for *The Architect* they never reached our office. We have a right to ask Mr. Councillor RADWAY what evidence he has of the act of Major DAVIS? Is he making use of imagination, like the men who devised the amazing Arms of Bath which Major DAVIS tried to set aside?

THE first commission given by M. LARROUMET, the new director of Fine Arts in France, was to M. PAUL SÉDILLE, the architect, and M. OLIVIER MERSON, who stands in the front rank for wall-painting. The commission is for a doorway to the section of the Exhibition of next year which will comprise examples of pottery and tapestry, from the Government factories of Sèvres, the Gobelins, and Beauvais. The gates will be designed by M. SÉDILLE, and M. MERSON will supply the studies for the figures in mosaic, symbolising the arts of tapestry and mosaic, which will be introduced at the sides.

THE two pictures by M. MUNKACSY, *Christ before Pilate* and *Christ upon Calvary*, which have gone the round of English provincial towns, are now the property of M. VANAMAKER, who has paid 20,000*l.* a piece for them. It seems an enormous price, for the scene at Calvary did not extend the reputation of the artist.

A DECISION has at last been given on the question whether clay is a mineral, and Glasgow is relieved from all fear of destruction of a part of its reservoirs. In 1871 the Corporation paid 11,000*l.* for land on which it was proposed to construct a reservoir and other works. In the conveyance all coal and other minerals are reserved to the seller. A seam of clay for bricks was worked on the neighbouring ground by the successor of the seller, and he claimed the right to follow the seam and work, in spite of any obstacle offered by the waterworks, unless he received 10,000*l.* It was necessary to take an action in the Scottish Courts, and in the first instance it was decided by the Lord Ordinary in favour of the Corporation. On an appeal the Court of Session with one dissentient decided against the Corporation. The case was therefore brought to the House of Lords, when the majority decided in favour of the Corporation. The one dissentient was Lord HERSCHELL, of whose ability as a lawyer there is no question. The result is exactly what we anticipated several months ago. In a mineralogical sense, and, we might say, in a microscopical, clay could sometimes be considered a mineral; but in the sense in which the word is used in Courts it could not have that acceptance.

CONFERENCES on copyright are not exhilarating to anybody but the speakers. There is, however, a chance that the one which opens next month may, through the influences of the surroundings, have less of the qualities which are supposed to be inherent in anything relating to the Dismal Science. A Congress in the Senlis Gallery of the Doges' Palace of Venice should certainly show some signs of grandeur in order to be worthy of the place. On Saturday, September 15, the inauguration of the Copyright Conference will take place. Then there will be a discussion upon the new copyright proposals of America, which are another example of the ease with which this country can be hoodwinked in its foreign relations. It will then be considered whether any improvements can be made in the foolish recommendations of the Convention of Berne.

The relations between authors and publishers will be discussed, and a model form of contract will be exhibited. The success of the Congress will be celebrated in a characteristic way with the aid of fireworks. It is worth remarking that the French artists will not allow themselves to be befooled by conferences of fussy men who are seeking after notoriety. They have lately held a meeting at which it was declared that their interests were more menaced than ever by the Americans. So much plain speaking is not to be expected in England, where there is unbounded faith in congresses and conventions.

M. BAUDOUIN, whose decorative frieze for one of the schools of Paris, and paintings in the theatre of Rouen, have been reproduced in *The Architect*, is again successful in the competition for the decoration of the Mairie of Arcueil-Cachan. His design was well deserving of acceptance from the poetic spirit which was manifested in it. Of all the pupils of M. PUVIS DE CHAVANNES, not one has been more successful than M. BAUDOUIN. But he is no copyist, for his style is distinct from his master's in everything except in a recognition of the relation between poetry and painting. It is a pity there is no French LESSING to write a discourse upon the paintings of the master and pupil. The second prize was awarded to M. BRAMTOT, and the third to M. VIMONT. Examples of the paintings of both have been illustrated in *The Architect*.

Now that the Post Office Department of France has at last taken possession of the building which for years could not be used owing to the difficulty of finding suitable lifts, a question arises about the disposition of the part of the site of the Tuileries containing the wooden sheds which served for the temporary chief post-office for Paris. It will not do to have the sheds exhibited to the visitors who are to appear next year. Some officials desire to convert the site into a garden, but others have a grander scheme, and want to have the entire site of the Tuileries used for a colossal memorial of the Revolutions. It was intended to apply for a grant to enable the place to be transformed, but the Chambers did not wait to discuss the subject. One thing is certain, that some improvement, although it may be only temporary, must be effected before next year.

OPERATIONS have begun this week for carrying out the improvement designed by a private benefactor, as we lately noted, on the waste ground on the western side of the Law Courts, and the ground has been invaded by workmen with an imposing array of wheelbarrows. The work is expected to be completed in about five or six weeks' time. Unfortunately the winter will by that time be getting near, so much of the enjoyment of the place as an ornamental garden and open-air lounge must be postponed for another year.

THE fate of relics in Scotland is not always happy. Persons, it seems, are willing to possess them if possession does not necessitate pulling out the purse. A week or two ago there was found in the foundation of an old house a fragment of a sculptured stone that in days gone by had formed part of an altar tomb in Arbroath Abbey. An inscription on an effigy is rare, but there was lettering on the collar of the torso, and this has been deciphered by Dr. JOSEPH ANDERSON, of the Edinburgh Museum of Antiquities, as forming the words, "HIC JACET ALES . . . GARDI"—part of the inscription being obliterated. The date of the stone is put down as about the end of the fifteenth or beginning of the sixteenth century, and several names of ALEXANDER GARDYNE appear in the Abbey chartulary about that period, pointing probably to the identity of the tomb. The stone, however, disappeared on Saturday from the yard of the builder of the new Inverbrothock Church. As it weighed about three hundredweight, it must be imagined that only the most enthusiastic devotee of archæology could have been inspired to annex it. At Dalmeir, it is stated, a workman some twenty years ago found a Roman monumental stone with well-preserved inscription, but as no one was found to contribute a shilling to the man for his time, an American secured it for Chicago.

## THE FADING OF WATER-COLOURS.

WHEN it was announced by Sir J. C. ROBINSON that the water-colours in the South Kensington Galleries were gradually fading, no visitor was prepared to say that anything was ever done to resist the transformation. One might go through the galleries of the Museum all the year round without meeting with an officer who seemed to watch the effects of sunlight or gaslight upon the drawings. At the National Gallery a visitor may always expect to be disturbed while he is gazing on a picture. Sir F. W. BURTON apparently is always thinking of his treasures, and rushes in with a magnifying glass from time to time in order to ascertain whether the change of a cloud may not produce an effect upon a particular picture. If his scrutiny is satisfactory he goes away smiling. But at South Kensington there is no longer any resemblance of the old enthusiasm. It is now to all appearance conducted on the principle adopted in the ordinary Government office, which is to avoid trouble at all cost. If a visitor has need of information, he will do well to consult the constables rather than the permanent officials.

With all their knowledge of the contents of the museum, it was not to be expected that the policemen could discern any changes which time, gas, or electricity could produce in the water-colour drawings, and of course the public knew enough about the value of the official statements. There was so little confidence in the administration, that the mere assertion by one expert of a deterioration in the drawings was followed by the appointment of a Special Commission.

The first report which has appeared is from the scientific advisers, and, like most documents of the kind, it is of a roundabout character, and facts which are universally known are announced as if they were discoveries. When it is found that the reporters are puzzled at the beginning as to why a pigment is coloured, or, in other words, why a pigment is a pigment, a reader will be apt to throw the report aside. But that sort of speculation must be taken as part of the scientific procedure in an inquiry, as in the ancient systems of conducting war there are no short cuts. We must make allowance for the preliminary posturing, or take no notice of it, and draw what is practicable from the researches.

It may be said that the conclusions of the experts show that the fading of water-colours is an extremely slow process unless under special conditions. It would take a century at South Kensington to produce any marked alteration in water-colour drawings, supposing they were subjected for that time to sunlight, and they must be exposed for thousands of years to artificial light to produce a similar effect. The latter statement will be a surprise to many, and, for our part, we believe injury to the paper of the drawings would be accomplished in a lesser time. But the experiments by Dr. RUSSELL and Captain ABNEY will be sufficient to allay a panic among collectors, although there may be some misgiving about assuming that the condition of thousands of years hence can be inferred from the effect produced by light on a series of washes by a practised hand on WHATMAN'S drawing-paper. We may conclude that no fear of a diminution of value will keep people from buying water-colour drawings. The estimates of the time allowed for the permanency of water-colours may be over-liberal, but, with all deductions, enough remains to give security to buyers. We may therefore conclude that the patronage of a form of painting which may be said to be English will remain as before or become more general.

It is plain, however, that colours do not fade in an equal degree, and after a number of years a scheme of colour on a drawing may be changed. But it is not impossible that cases may arise when the change will be advantageous. The experiments, also, will appear to be unfavourable to the system of using opaque and transparent colours together. Twelve mineral colours were found to withstand the action of light, and it is easy to imagine the difference which would be presented by a drawing in which they were used along with transparent colours which are more amenable to light. Another result is that Chinese white not only diminishes the permanency of any colour with which it may be combined, but it ceases to be white and therefore changes the other colour. Prussian blue, crimson

lake and Chinese white become a bright pink instead of a bluish purple. These circumstances were observed before, but the report will give them scientific precision.

But the number of colours which may be considered as permanent is remarkable. Out of thirty-nine colours in open tubes which were exposed to the atmosphere, twelve were not affected and two in a slight degree. When the same colours were exposed in dry air twenty-two were unaffected. In a moist atmosphere the number fell to ten, but in an atmosphere of moist hydrogen gas the number again rose to twenty-two, and when the trial was made in vacuo there was hardly any change. It is even laid down as a rule that all pigments are permanent when exposed to light in vacuo.

It must be remembered that the conditions under which the experiments were made did not entirely correspond with water-colour painting. If every artist could lay on his washes once and for ever like the practised hand employed by the Commission, the results would be conclusive. But water-colour drawings are not always produced in that way, and what is needed are experiments with works of another kind which are more than "a series of washes." It would appear from some of the experiments that most danger arises from combinations of colours which are mixed by the artist himself. In one experiment, all the combinations of which Prussian blue was an element were transformed. But it cannot be expected that prepared colours will ever be produced to suit all circumstances. The artist must always be to some extent his own colour-mixer.

But the inquiry will not be complete if it is restricted to an analysis of colours. It would be well to inquire whether drawing-papers exercise no influence. Considering how varied are the sources from whence materials for paper are derived, is it not unreasonable to suppose that the paper is always innocuous, and is without effect on the pigments which are applied? Another subject might be whether the combination of colours by different makers will produce a result the same as that when the cakes or tubes of the same maker are used. There are colour makers who are supposed to be most successful with certain colours; one, for instance, always produces excellent crimson lake and Prussian blue, but it is not impossible that they would not ally themselves in a friendly way with the products of a rival maker.

There are many other points which will suggest themselves to the artists on the Commission as requiring investigation. Nowadays commissions are not restricted by rigid conditions, and although the primary purpose of the inquiry was whether the water-colours in the South Kensington Museum had become less valuable, it is easy to give a wider interpretation to the words of the direction by which the investigation was initiated.

The report is an additional testimony to the value of the electric light as a means of illumination in galleries. It was found that with colours most easily acted on, and when placed under conditions most favourable for fading, no change took place in the majority of colours and mixtures. This conclusion cannot fail to be used by the advocates for the opening of the National Gallery at night. For it will be said that oil-colours must excel water-colours in permanence, and when the danger of fading with the latter is infinitesimal, with oils it need not be taken into account. But a special inquiry will have to be made on the subject, and it would be best to allow the trustees of the National Gallery to select the chemists and members of the Commission.

The report does not give any suggestion which may be utilised by architects when designing galleries or rooms which are to hold pictures. The nearest approach to one is in the part which says that the presence of moisture and oxygen are in most cases essential for a change to be effected even in the vegetable colours, and the exclusion of moisture and of oxygen, especially oxygen in an active condition, would give a much longer life to the vegetable colours than they enjoy when freely exposed to the atmosphere of a room. It is not difficult to operate on the moisture, but with free oxygen it is otherwise, and it is to be hoped that more will be said on the subject in future reports. In an inquiry of the kind, it might be supposed that questions of lighting and heating would arise, and, therefore, the presence of an architect on the

Commission would be an advantage. Architects are not in favour at South Kensington, and they were ignored in forming it.

### NATIONAL GALLERY, DUBLIN.

SOME of the recent purchases for this gallery have now been hung. First there is a full length portrait of John Fitzgibbon, first Earl of Clare, the Lord Chancellor of Ireland of the time of the Union. This fine picture, which was recently purchased from the Fitzgibbon family, at their seat, Mount Shannon, in the county of Limerick, was at the sale erroneously attributed to Sir Joshua Reynolds, but is no doubt in reality the work of Hugh Hamilton, who was at the time it was painted in the full enjoyment of his reputation as the chief portrait painter in Dublin. He is represented standing in full Chancellor's robes, holding the official purse in his right hand, and appears to be speaking somewhat energetically about a paper on the table beside him, to which he points. For an historical collection of this kind the picture is an acquisition of importance, the subject being a prominent figure in Irish history, and the portrait having the qualities of thorough authenticity and artistic excellence, the latter also exemplifying the native talent of the time.

Next there is a portrait by Sir Joshua Reynolds of Richard Burke, the only son of the Right Hon. Edmund Burke, whose premature death at the age of thirty-six brought his father's career to an end, and broke his heart. The picture represents a young man of almost effeminate beauty. As a painting it may be said somewhat to lack finish, and probably was commenced and put aside to make way for the one now in the possession of Earl Spencer, and from which an engraving was made for Burke by James Ward, which so satisfied him that after receiving a few impressions of it for his own use he returned the plate to the engraver as a gift. A good impression of it from the Chaloner-Smith collection is here placed near the picture for comparison. Until it appeared at Christie's its existence was unknown, and it is likely to be the only portrait of young Burke except the one above mentioned, and a replica of it in the possession of Lord Fitzwilliam.

A portrait represents King William III. as a boy of about eight or nine years of age. It has always been attributed to Cornelius Janssen, but is more likely an old copy of the original, which is known from a contemporary engraving. It comes from the Hardwicke collection, and was probably brought to England by one of the family who was sent as ambassador extraordinary to the Hague early in the last century. Near it is a quaint contemporary portrait of Robert Dudley, Queen Elizabeth's Earl of Leicester, appointed Lord Deputy of Ireland the year of his death. In another part of the room is a pastel drawing of Philip Earl of Chesterfield, of the "Letters," Lord-Lieutenant from January 1745 to October 1746. It is the work of William Hoare, commonly called Hoare of Bath, where he flourished in the days of its glory, and was famous for his coloured crayon or pastel portraits, of which this is a first-rate specimen.

Oil portraits of Lord Carteret and of the Marquis Camden have also been added to the list of Viceroy's represented in the collection. The former is by Hudson, the master of Reynolds, and comes from the Hanbury-Williams family. The latter is by Sir Thomas Lawrence, as well as a portrait of the Right Hon. John Wilson Croker, which is looked upon as one of the painter's masterpieces. The picture came from Lord Lonsdale's collection, and has been engraved in mezzotint by Samuel Cousins. Illustrating another phase of Irish genius will be found the portrait of Quin, the Irish actor, in his part of Falstaff, in a group from a scene from the play of "King Henry IV." It is painted by Francis Hayman, R.A., a contemporary of Hogarth. In the same category is the little head of Macklin in the part of Shylock, by Zoffany.

### ARCHITECTS' DRAWINGS AT EXHIBITIONS.

AN article on the "General Indifference to Modern Architecture," from the pen of Mr. G. Washington Browne, of Edinburgh, appears in the current number of the *Scottish Art Review* :—

Mr. Honeyman, in his able article on "The Exhibiting of Architectural Drawings," has, Mr. Washington Browne says, struck deep at the root of the lack of interest in such exhibitions. If this lack of interest were confined to architectural drawings it would be a matter of comparatively little regret, as an architect would no more desire to have a final judgment passed upon his artwork from a conventional drawing representing his building from one fixed point of sight, than he would desire to have his deportment judged by a *carte de visite* representing his person in one single aspect. He could equally well afford to dispense with both representations, or, if you

prefer it, *mis*-representations. The indifference of true lovers of art to architectural drawings is an unpleasant fact that architects must admit, with more or less reluctance, according as they feel it touches their art; but they might endure this neglect with calmness did it measure the full extent of the indifference. I fear, however, the evil is a deeper and more serious one—that it is not limited to architectural drawings, but extends to architecture itself.

Before we can accept the theory that the deserted condition of the architectural gallery is to be wholly accounted for by the absence of the buildings themselves, we must be persuaded that, were it possible to have them present, they would be studied by all true lovers of art with an interest and an affectionate regard equal to that bestowed upon the paintings in the adjoining galleries; or that, in the places where they stand they are so studied and lingered over. I am not sanguine enough to believe that they are so. Do the various buildings that are within the grounds exercise this attractive influence? And I seek to apply the question to two buildings only, which are most favourable to that view of the question. Is the Bishop's Castle regarded with that loving interest that a local building called back into life from the grave of past centuries might be expected to excite, were we to accept Mr. Honeyman's theory? Is the clever reproduction of a Dutch House, in which Van Houten's cocoa is dispensed, studied or lingered over with one tithe of the affectionate regard bestowed on a single picture of Maris or Israels? And yet these have much in them to attract the curious—a more numerous multitude than true lovers of art. But it may be urged that these are not real, that they are but representations, neither cleverer nor better than many of the architectural drawings, and equally false as far as true art is concerned. Then surely the University Buildings on Gilmorehill are sufficiently real; and how many of the refined and cultured men who enter its gates daily study or think of it as a work of art, though seeing it just where it stands? The Royal Exchange is sufficiently real; and how many of the wealthy merchants who pass under its noble portico regard it, or think of it, as a work of art? Yet many of these men are art patrons, with worthy sculptures in their halls and exquisite paintings in their rooms, and who shall say they are not, many of them, true lovers of art? And what shall we say of gifted and successful painters who are content to live in houses innocent of architectural art? or of Royal Academicians voting for the election of Architect Associates on hearsay, without a knowledge of or opinion concerning their artwork? Surely this, that even true lovers of art do not love all the arts equally; and there are many reasons, technical and other, why architecture must always have fewer admirers than the sister arts of painting and sculpture. Architecture is their elder brother, more practical and hard-headed than they, and less lovable than the softer, fairer sisters.

There seems, then, to be a weightier problem requiring solution than that Mr. Honeyman has dealt with, and which bears much the same relation to his that the substance does to the shadow. Will modern architecture bear the test of attractiveness which Mr. Honeyman applies to the exhibition of architectural drawings? And if it will not, is the inference inevitable, "it is falsehood that intervenes"? If the test and inference are true as applied to architectural drawings, can we escape them when applied to architecture? Or is the test unfair and the inference untrue in one or both cases?

It appears to me that the lack of interest taken in architecture outside the profession, whether it be in conventional drawings or in the buildings themselves, is due in large measure to the absence of any personal identity of the architect with the artwork he produces. The personal identity of the artist with his work, of the producer with the thing produced, is a special characteristic of modern life and thought. The value attached to a picture attributed to a great master is determined rather by the presence or absence of an authentic signature than by the intrinsic merit of the picture itself. The personality of the architect is seldom thus identified with his buildings, and this has much to do with the lack of interest taken in them by lovers of art as well as by the general public. Add to this that a building is not the work of the architect's own hands in the immediate and direct sense that a picture or a statue is the handiwork of his brother artists of the brush and chisel, and his personality becomes more obscure, and the interest in his work diminishes proportionately. Why should not the architect inscribe his name on his building as the painter does on his canvas, or the sculptor on his marble and bronze? It is done in France, and the French take a deeper and more real interest in architecture than we do. How many of those merchants or students we spoke of know the name of the architect of the building they frequent, or would be interested in remembering it, though they heard it? Yet one never looks at a painting or a statue without asking, "Who is it by?" Erase the names from the canvases in the picture galleries, and how much of the interest vanishes with them?

Let me not be understood to say that by inscribing the architect's name upon the corner of our buildings, general

interest would at once be excited in architecture. The interest would not be immediate, and I have already indicated my belief that interest in architecture will never be so general nor so deep as in painting and sculpture. But I submit that the absence of a personal identity of the architect with his work has much to do with the lack of interest in this important department of art.

### MASONS' MARKS.\*

THE substance of this paper was prepared many years ago at a time when I found myself interested in the subject whilst engaged in work on a building in the North of England, where upwards of 1,000 masons were employed, and each man working in the sheds had a separate and distinct mark, a register being kept by the chief foreman wherein every man's name and mark were entered side by side.

The system in use at the present day amongst masons is that each man, as he finishes his work at the banker, places his mark upon the stone before it leaves the shed. The banker is the stone bed or bench upon which a mason works when squaring the rude material and forming the finished article. In the Coventry Guild accounts of 1461 the benches in St. Mary's Hall are called bankers. These marks have hence been called banker marks, and perhaps the name is more appropriate than that of masons' marks, as the setters, who are usually selected from amongst the best workmen, make no marks upon the stone. The object of the register of marks, and the necessity of the marks being placed upon the various stones, is that the setter whilst erecting the walls is able to distinguish the work of individual masons, and if he finds anything wrong with the stonework can complain to the foreman, who will ascertain to whose account the error is chargeable. Masons' marks are now placed upon the top bed of the stone, and hence do not appear upon the face of our new buildings, but in times past, when Gothic architecture flourished in England, from later Norman, Perpendicular, and even to Tudor periods, the marks were for the most part placed upon the face of the stone, to be seen and inspected; but with the decline of Gothic architecture they appear to have disappeared from the face of buildings.

On leaving Manchester, in 1872, I found leisure to look up the subject in this locality, and the eleven sheets of marks before you represent, for the most part, those upon certain Warwickshire buildings within a few miles of Coventry collected at that time. There appear several kinds of marks in this district; first, a mere rude scratch of from 4 to 6 inches in length, and from 3 to 5 inches in breadth, made of various easy shapes, and formed by sharply drawing the edge of the chisel upon the stone. These are found upon the buildings to the west of Caesar's Tower, on Gaunt's Perpendicular work, and the so-called "Saintlow Tower" at Kenilworth Castle, and at Bubenhall Church. They are probably the work of restorers, and not of the original masons who first erected the buildings. Secondly, there are the more finished marks, smaller in size, of from 1 to 3 inches by half an inch to 2 inches, assuming correct forms and lines shaped into letters, numerals, squares, crosses, arrows, and various other characters. At Kenilworth they appear upon Leicester's Gatehouse and Leicester's Buildings (1570 to 1575) in considerable numbers, and also upon various parts of the castle restored by the Earl of Leicester in those years. They are found upon Berkswell and Foleshill Churches, and of a slightly larger size upon the walls of the crypt under the banquetting-hall (1392) at Kenilworth Castle, and exceedingly small upon the inner walls of the tower of St. Michael's Church at Coventry (1373 to 1395). These marks are, for the most part, worked in the centre of the face of the stone, unless the stone has been cut to make it fit in the course. They appear both under and above the plinth, and from the base to the top of the buildings. A third kind of mark is upon the Coventry town walls (1355 to 1415), and consists of marks in the shape of crosses and arrows, of sizes of 6 inches by 3 inches, cut deeply in the stone. A fourth kind is the hanger or line mark, peculiar for its length of line, which has a figure or character at one end, whilst the other end is generally turned up or down. These kind of marks are found on Berkswell Church, and at Kenilworth Castle upon the White Hall (1392), and the base of the staircase projection at the angle of Leicester's Buildings, which was probably the original Saintlow Tower built about 1390, and formed part of an older erection than Leicester's Buildings. Fifthly, there are also circle marks of from 5 to 16 inches in diameter, some plain and some with rays radiating from a central point. Circles with segments of circles and other circular form marks appear. These large marks greatly disfigure the stone upon which they are drawn; but smaller examples occur at St. Mary's Hall, Coventry (1394 to 1414), upon Hawkesworth's Porch to Leicester's Gatehouse,

Kenilworth, and upon Astley Church font. The sixth kind are double-pointed marks, generally in letters, as at the buildings west of Caesar's Tower, Kenilworth, and Berkswell Church and in monogram marks upon Foleshill Old Church.

Having thus briefly gone through the principal kind of marks found in the district, it may be as well to particularise the various characters met with, and then say something about masons' marks in general. Plain cross marks of two strokes only are common and occur at Kenilworth Castle, on Leicester's Buildings, circular staircase to ante-room, Leicester's Lobby and Gatehouse, and upon the Water Tower; also upon the Kenilworth Priory barn at Temple Balsall, Berkswell, Exhall, Corley, Astley, Baginton, and Sowe Churches. Two of these occur on one stone at Leicester's Buildings, which is unusual. A cross of three strokes occurs on Leicester's Gatehouse, and upon the circular staircase to ante-room. A cross-mark of four strokes occurs at Offchurch Church, whilst a similar one at Lichfield Cathedral has one of its ends terminating in a crook. There is a cross of two strokes more deeply cut on the buildings west of Caesar's Tower, and upon the projection to Leicester's Buildings, at Kenilworth, whilst there is a cross fitted, with the thin points meeting at centre, upon the buttress of corridor leading to the crypt under the banquetting-hall at Kenilworth. On the Coventry walls is a plain deeply-cut cross-mark with equal members; the same appears with the leg extended, and the same mark with legs in the shape of an inverted V occurs, and also one having two strokes on the left side. A regular formed cross-mark, with legs, occurs at Kenilworth, in the crypt under the Great Hall in Leicester's Gatehouse, and in the base of the staircase projection to Leicester's Buildings. Deeply cut cross-marks, with the points terminating in dots of various forms, occur upon the Perpendicular work of the banquetting-hall and recess adjoining at Kenilworth Castle, St. Mary's Hall, Coventry, and Exhall Church (near Coventry). At the latter place are several interesting specimens close together, upon the west side of the tower, the lower parts of which are enclosed within a circle. There is an interesting panelled stone with a masons' mark at Exhall, a sketch of which is shown on sheet No. 9 of drawings. On the walls of the Presence Chamber, Kenilworth, is a cross with an angle under it, similar to those at Chester Cathedral. The square cross form with ends turned up towards the left occurs at the Priory Gateway, Kenilworth, whilst at Temple Balsall and Stoneleigh Church the ends of the cross are stopped or barred in some or all of its members.

Masons' marks are represented hereabouts by sixteen letters of the alphabet; some letters are rarely used, whilst others, as N, R, and Z, are often repeated; but alphabet marks are not found to be largely used on most buildings. Sometimes a double W occurs, as at Kenilworth Old Church; at Wyken and Sowe Churches a W has dotted ends; at other places the ends are barred; on the buildings west of Caesar's Tower, Kenilworth, an R has double points. Numerals are not often represented; there is a small figure 1 at St. Mary's Hall, Coventry, and the figure 4 occurs on the buildings to the west of Caesar's Tower, and on Lunn's Tower, Kenilworth; a 1, Ryton Church, and on St. Mary's Hall, Coventry, doorway to crypt. There is a figure 8 in Dudley's Lobby, Kenilworth. The hour-glass mark occurs at Berkswell Church, Leicester's Buildings, and Dudley's Lobby, Kenilworth. The pentacle or five-pointed figure exists in numbers upon the north end of the stables at Kenilworth Castle, sometimes with plain points, at others dotted at the terminations. The hanger or line marks are peculiar, and the terminations at the end are strange, as will be seen in the drawings. Arrow marks appear upon St. Mary's Hall, St. Michael's Church tower, and the city walls at Coventry; upon Foleshill Old Church, the oriel window of the banquetting-hall at Kenilworth Castle, and at Temple Balsall Church. There are many other figures representing squares, angles, and various geometrical figures, as the drawings will show.

We have thus run through the chief kinds of masons' marks found upon the buildings in the Coventry and Kenilworth districts, and now proceed to offer some remarks upon the marks in general, first premising that masons' marks are found in all civilised countries—on the Pyramids of Egypt, the Anglo-Roman work of Hadrian's Wall (second century, England), the temples of India, and the walls of Allahabad, walls in Syria, the church of St. John at Jerusalem, on Greek and Roman temples, and the wall of Carthage. The explorer has even found them upon the squared stones left and not used at the quarries by King Solomon, and in a tumulus in the island of Zetland, in Mexico, Persia, Lycia, Mesopotamia, and Asia Minor. Most of the great ruins, castles, manor-houses, cathedrals, and churches of England, Ireland, Scotland, France, Germany, Switzerland, Austria, Spain, Portugal, the Tyrol, and Italy, show these marks upon their walls. They occur upon the finished stones only, generally upon the outer walls, from base to battlement. Through the world many of them agree in character, many of the same figures being universally produced. We may well be at a loss to comprehend why these

\* A paper read by Mr. T. W. Whitley, of Coventry, on Wednesday evening, the 8th inst., at the meeting of the Royal Archaeological Institute, Leamington.

precisely similar marks should have been adopted in different countries, unless we attribute them to some widespread organisation, some system adopted by and coming from a central source or authority. In England few if any marks appear on very early Norman work, and I may hazard an opinion that their origin, in a great measure, was fostered, if not attributable, to the guilds of masons, whose members used them.

Now, with reference to these guilds and their foundation, the Pope issued a bull shortly before the year 1200, granting powers to bishops and others to build churches, and to attach to them a certain number of "liberi muratores," or "free-masons," which had great effect upon church buildings at the time. The purpose of these workmen was to direct and execute the more ornamental parts of buildings, and Bishop Lucy, building his cathedral at Winchester in 1202, instituted a confraternity to last five years, and almost simultaneously masons were at work upon Wells (1213), Salisbury (1220), Worcester (1218-30), Peterborough (1233-46), Lichfield (1235), Durham (1230), Ely (1235), Lincoln (1240), York (1227), and many other places in England, encouraged by the clergy to band together. The greater lords and gentry soon obtained the services of these early guild masons to build their castles and manor-houses. The guild masons spread far and wide, becoming travelling masons, amongst whom were many foreign workmen, coming and going from place to place, where they had lodges or guilds, sometimes settling permanently, where sufficient work could be obtained, each mason in the guild having his mark. It is not known in what year the masons first obtained a guild in London, but the Masons' Company, springing from the guild, had its existence in the time of Edward III. At Coventry there was a Masons' Company at an early date, but it never was large in numbers. In 1448, out of a total of 603 armed men supplied by the twenty-three City companies, in a call during the wars of York and Lancaster, the masons only supplied seven men, the average being twenty-six for each company. In the play acted before Queen Elizabeth, at Kenilworth, in 1575, valiant Captain Cox, a mason of Coventry, appeared, and was probably engaged in the Earl of Leicester's extensive additions at that time just completed. It does not seem, as has been thought by some, that there was a system of symbolism in these masons' marks, and that each character had an hidden meaning. In this country the stones were picked at random by the setter, and worked indiscriminately into the walling, and thus sometimes the mark is upside down and sometimes on its side, as the setter's will or the necessity of the case required. If they had been symbolical, greater care and regularity would have been used in their arrangement in building the walls.

The marks have nothing whatever to do with the Freemasonry of to-day, and there is little to be solved about them. Kings, lords, and gentry had their arms and badges to distinguish themselves and their families, the merchant had his mark, by which in later times his goods were known, the porcelain manufacturer placed a mark upon his manufactures, and we have shown the purpose for which these marks are now used on large works. They were the forerunners of trade-marks, and diffused by travelling masons. We know that even beggars and tramps in our day have marks which they leave in different ways, to distinguish good, bad, and indifferent places for their companions to call at, whilst the Bedouin Arabs have marks which they place on tent or wall, by which their tribes are known and distinguished the one from the other. Upon examination of the stonework of the Norman Keep of Kenilworth (circa 1130), no masons' marks are found, but the late Mr. Godwin (who was the first to direct attention to the existence of these marks) alludes to one representing a letter W, but this was probably upon the restored parts of the buildings to the west thereof. I have, however, found marks upon late Norman work at St. John's, Chester, Offchurch Church, Beaudesert Church, and Berkswell Church, but they may be upon restored parts. These marks, as has been said, I venture to suggest as more or less attributable to the members of the masons' guilds or companies. Every man, after serving his apprenticeship and becoming free of his guild, had a mark allotted him, and the mark when placed upon the stone not only served the place of individual recognition, but was sometimes for the purpose of payment when piecework was done. Their occurrence is evidence of a great building society having been diffused through the country, which had a common object and purpose. Where large quantities of the same mark are found, as the N at St. Michael's Tower, Coventry, or the R and X at Leicester's Buildings, it seems probable that all the stones thus marked were not the work of one workman alone, but of several working in common in the sheds, and the figure was adopted for the payment of taskwork. It is likely that most of these stones were worked and marked at the quarry, and brought to the building for use as required. It is rarely that two marks occur on any one stone. In that case, probably, two men worked upon it, for some reason. Instances occur at Beaudesert Church and at Kenilworth. Where a large body of

men were employed on a building, it was often to their benefit to prepare the stones by piecework, Gothic stonework being of small, and of an innumerable quantity of stones, with considerable work thereon. To enable the builder to give payment to the numbers employed in an easy way, without error (for we cannot suppose that in the early days, when few masons could write, that a very elaborate system of book-keeping existed), the time being calculated by the day, and not by the hour as now, as the men finished the stones they placed their mark upon them to show the work done, and were paid accordingly. The marks, too, were a kind of rude heraldry, the secret shop marks of the trade, by which not only was one mason known to the others, but the marks were in some cases handed down from father to son, and by these marks the members of the family, or shopmates working together, could, in some cases, be distinguished by various additions being added to the chief or foreman's mark. The marks upon the Coventry city walls appear to illustrate this. Taking the foreman's mark as a cross of equal members, another person has a similar cross with a longer leg added, another with legs slanting right and left, added to the foreman's mark, another with two slanting strokes thereto, and another with the two slanting strokes without the first or foreman's mark appears.

Masons not only used their marks upon the stones they worked, but placed them upon the various instruments of their trade, for in an excavation at Newminster Abbey, near Morpeth, in 1878, a hone or sharpening stone was found, upon which was a masons' mark. In many instances, by careful attention, the approximate number of masons engaged upon a building may be found by counting the number of marks thereon. There are no less than thirty-six distinct marks upon Leicester's Gate House, Kenilworth, which are mostly repeated upon Leicester's Buildings, and discernible upon other parts of the Castle, which the Earl of Leicester enlarged in 1570, at the great cost in those days of 60,000*l.* to render the place suitable for the reception and residence of Queen Elizabeth; but upon these buildings we find many stones unmarked, side by side with those having marks thereon. Were these left so by accident? It would be necessary to engage non-guild or non-company masons and local masons to hasten on the work, and thus the existence of non-marked stones may to some extent be explained. The stones of some buildings have no marks shown whatever. Were all the worked stones left without the marks the work of non-society men? Then some were the work of apprentices, who would have no mark. The number of apprentices that a master mason could have was regulated by constitutions. The stonemasons of Strasburg in 1459 were to have but three each, and we find that "he may set to work fellows of the same lodge—that is, if the Lord so permit"; but we are told that if "he have more buildings than one, then shall he have no more than two apprentices on one building, so that he shall not have more than five apprentices upon all his buildings." In one of the earliest English documents where the word "Freemason" occurs, viz. in the building contract of 1435, where William Horwood, "master mason," contracts with Richard Duke of York, "to neyther sett mor or fewer Freemasons, rough setters, no boys thereon, but such as shall be ordeigned" (that is, non-members of the Company), from which it appears that "unordeigned" masons were sometimes set on at the work, the "rough setters" being local men and "stone wall or hedge builders," and the "boys" apprentices. Some local instances there are where old stones, having no mark on the face, have been found to have one upon the upper bed similar to the work in our time. We find that as some buildings advance in height the marks become fewer in number as the building progresses, whilst there are many marks in the lower courses and few in the top. But this is not always the case, and St. Michael's steeple contains marks from the ground to the top of the tower. The thirteen modern marks shown on drawing No. 7, which were placed by the masons working this year at St. Michael's Church restoration upon the top stone of the spire, fixed on August 1 last, may be of interest. A knowledge of these marks is useful to the archaeologist. For instance, on careful examination we find that the marks upon Leicester's Buildings, Kenilworth, and the projection or angle buttress adjoining thereto, are of quite different kinds, and this leading to re-examination of the buildings we find the projection is part of an older tower; again, the old stabling at Kenilworth Castle has been much disturbed, and the existence of marks on the northern end point out the unaltered part of the wall there. They may also help to fix the date of the erection of buildings in some cases. Perhaps I have devoted more time to this subject than it deserves, but, at all events, I hope to have shown that the subject is of interest. It is possible that if the various marks in the Midlands were collected together, with the known dates of the various buildings they are upon added, a more definite conclusion could be come to as to the object, use, and meaning of these characters, and it would throw considerable light upon the working of the builders to whom we owe the ancient and historic buildings of our native land.

## ART TRAINING FOR JEWELLERS.

THE arrangements between the Birmingham Jewellers and Silversmiths' Association and the committee of the Municipal School of Art, for the opening of art classes for students between the ages of twelve and twenty have been completed. The following scheme has been accepted as an experiment for two years:—(1) A special room to be set apart for the Jewellers' Association class, in the Board Schools, Ellen Street, Birmingham, the students to be taught by a separate master or masters, on definite lines, preparatory to the study and practice of artistic design, suited to the trades in which the students are engaged. (2) Every student to be entered by and through the Jewellers' Association, and to have the option of attending the classes five nights per week during the autumn and winter terms, but to undertake to attend at least three nights per week as a condition of being allowed to study. (3) The education of the Association students to be free, except so far as the cost of drawing materials, which they will themselves provide. To secure this the committee propose that the Association shall subscribe one-half the cost of the education of the students, the employer in each case providing the remaining half. The School of Art committee have met this case by placing the entire fee at 3s. the autumn, and 2s. 6d. the winter term for each Association student. These fees must be paid in advance. The plan is to commence in September, on condition that forty students are prepared to take advantage of it. The committee hope that a great impetus will thus be given to the character and position of the trade in its artistic developments, as well as a new interest awakened in their occupations on the part of jewellers themselves.

## THE LATE MR. JOHN M'LEOD.

THE death of Mr. John M'Leod, of Hope Street, Glasgow, at the age of fifty years, took place last week at his residence, Overcliffe, Dumbarton. Mr. M'Leod, who was a native of Dumbarton, and son of Mr. William M'Leod, joiner, saw miller, and timber merchant, The Saw Mills, Dumbarton, started business as an architect many years ago, and his career has on the whole been successful. His professional attainments were of a high order, and his services were therefore constantly in demand. He has designed many public buildings in Glasgow, including the Christian Institute. In Dumbarton he acted as the burgh architect, and designed many public buildings, chiefly in the way of schools and churches. His latest effort in the latter direction was the West Bridgend U.P. Church, a structure characteristic of his work for his professional skill and ability. Knoxland School in Dumbarton is also one of his buildings. Deceased was of a modest, unassuming disposition, greatly respected by all who shared his friendship. For some time past he has been in rather indifferent health, but the end came somewhat suddenly, having been seized with a very violent illness, which baffled all medical skill. Mr. M'Leod received his professional training from Mr. Spence, of Glasgow, after which he went to London, where he was engaged under Mr. G. E. Street.

## TESSERÆ.

## French and English Windows.

SIR G. G. SCOTT.

THE Romanesque windows were simply openings with round heads, the jambs and arches being either perfectly plain, moulded, with or without enrichment, or the jambs shafted. These windows were most usually isolated, but were here and there grouped into couplets, triplets, &c., or made to form portions of continuous arcading. In the early days of the Transition the windows remained unaltered, otherwise than as to the general refinement of their details. Later on the arches were made pointed, and their proportions somewhat elongated; and even in the fully developed Early Pointed style—properly so called—the window differs little in principle from that of the Romanesque period, though in fact it assumes a widely different form, through its carrying towards their ultimate results of the principles of grouping began during the previous styles, and those of refinement and elongation incidental to the Transition. It is in carrying out these principles to a still greater extent that the Early Pointed of England differs from that of France. It is really the same style, and no important feature can be pointed out in the one country which is not to be found in the other; but just as the Germans, by dwelling longer on the Romanesque style, rendered it more refined and perfect than elsewhere, the English, by the continued retention of the unmullioned window, systematised its use in a manner not equalled in other countries. I see no difference of principle in the fenestration of the Early French and the Early English Pointed styles; in both the principle was the

decoration and combination of single lights. Nor do I see that in England this was done in a manner essentially differing in any respect from what was common in France. The great difference was the far greater width of the French openings, which often rendered their windows inelegant in proportion, while it offered a noble field for stained glass. The characteristic of the English windows, on the other hand, was narrow and tall proportions, and a greater amount of enrichment of the jambs and arches, though none of these are by any means constant features. Sometimes we find in English work lightness carried to a vicious extreme, as in the beautiful but frail eastern transept at Worcester; though in the majority of instances it retains a masculine firmness and solidity, as in the east end of Whitby.

## Etymology of "Fret."

S. BEAZLEY.

When I mentioned the triangular *frette* of the Saxons, I had not met with the following etymology of the word, and the probable origin of the ornament, in Turner's "History of the Anglo-Saxons," which, as it is pleasant to derive all our decorations from objects in nature, I am particularly pleased at having seen. *Fratwan* is the Saxon word for adorning a building, and *fratw* for the ornament itself. From these words, *frette* is naturally derived—and *fratan*, meaning the teeth of fish, so nearly resembles them, that the triangular ornament of the Saxons most likely had its origin from the Saxon custom of stringing marine teeth.

## Points of View and Visual Angles.

C. R. COCKERELL.

"The architect," says Wren, "ought, above all things, to be well skilled in perspective, for everything that appears well in orthography may not be good in the model, especially when there are many angles and projectures; and everything that is good in model may not be so when built, because a model is seen from other stations and distances than the eye sees the building. But this will hold universally true, that whatsoever is good in perspective, and will hold so in all the principal views, whether direct or oblique, will be as good in great; if this only caution be observed, that regard be had to the distance of the eye in the principal stations." In this last particular the methods of the different masters have varied materially. For instance, Vanbrugh always supposed himself at a distance of 500 to 1,000 feet from his buildings, consequently his sky-line and contour are well studied, but his details wholly neglected, and the pleasing effect of his buildings in approaching them; whereas Adam supposed himself from 50 to 100 feet only from his buildings; consequently they have no contour from a distance, but are full of elaborate detail on the approach. The visual angle, extending at most to 45 deg., should be carefully applied to the points of distance, and the scale of the drawing or study should be correctly adjusted to this distance, so that no misconception should arise. A study for a building to be seen at 100 feet distance only will be on a large scale, and occupy the whole height of the paper, whereas, seen at 500 feet, it may be only one-fourth that size. The Greeks were consummate masters of this branch of optics, as we should doubtless have known had Aristotle's work on taste been preserved to us. The terms synoptic and eusynoptic correspond with the points of view which all their arrangements were calculated to afford. The Parthenon and the Temple of Jupiter Olympius—indeed, almost all the great temples—were approached on the angle, the peribolus and the propylea by which they were enclosed concealing great part of them, until they could be contemplated to the utmost advantage from a synoptical point of view. The plans of Palmyra and Baalbec and those of Rome, preserved to us by Palladio, are lessons in these respects demanding the most careful attention. It is obvious that street architecture, being seen chiefly in flank, should be treated otherwise than buildings at right angles with the point of view, as triumphal arches or terminations to the vista. In the fifteenth and sixteenth centuries perspective delineation became a new art in the hands of Lombardi, Bramante, Peruzzi, Raphael, and lastly the renowned Pozzi; and though Vitruvius assures us that in the fifth century B.C. Agatharcus wrote a treatise upon perspective, it is probable that the ancients never arrived at the skill attained by those masters. But perspective calculation applied to architecture, and the adjustment to the point of view was undoubtedly better understood practically by the ancients than ourselves, as their remains abundantly prove. The vista which shortens the length and discloses the end at once—the exposure of the entire object staring from a distance as well as near—the placing colossal objects in colossal places, are all modern mistakes. The temple at Luxor, the colonnade at Palmyra, are deflected in angles, so that the bounds are concealed, the successive columns disclose themselves by degrees, and the length seems interminable. The temple is partially hidden, and excites the imagination from the promise of its roof, entablature, and capitals, until it is permitted to be seen

in its overwhelming majesty. The columns of Trajan and Antonine are placed in confined positions, and the effect is tenfold. Palladio was remarkable for the adjustment of his building to the position, of which the Town Hall at Vicenza is one of the most remarkable examples. Vignola is said to have made his studies of his buildings at the points of view from which only they could be seen. It is quite certain that Sir W. Chambers was less master of this part of his art than of many others. Any one visiting the front of Somerset House, in the Strand, is satisfied with its scale and sufficiency in all respects; but when he enters the spacious quadrangle, and looks on the back of the same building, he experiences some disappointment—he finds the scale too small for the size of the quadrangle; but much more, when he observes the same proportions from the opposite side of the river, he deplors their littleness and want of mass and feature, the petty dome in the centre, and the confusion of chimney shafts which disfigure the roof. Had Vanbrugh disposed the river front, we should have seen those chimney shafts united in towers; the whole outline or sky-line would have been marked and varied with emphatic features, suited to the scale of the river and the majestic position given to the building.

#### Why Mortar Hardens.

G. R. BURNELL.

Until very recently it was held by most engineers and architects, by myself amongst others, that the solidification of mortars took place in consequence of the absorption of carbonic acid gas by the lime during the process of crystallisation; but it has been fairly objected to this theory, that the quantity of carbonic acid gas contained in the atmosphere which could be brought into contact with a large body of cement would not suffice to saturate the latter. The generally received opinion on the subject now is that limes harden simply in consequence of the combination with water which takes place during the slacking, and that the rapidity of the setting, and the permanence of the newly-formed hydrate of lime, depends upon its being combined with some other salt: the pure hydrate of lime in fact is soluble; the hydrated silicate of lime is tolerably insoluble, but it forms slowly; whilst the hydrated double silicate of lime and alumina, or of lime and magnesia, are practically insoluble. The facts actually observed seem to confirm these views, and they certainly enable us to account for not only the different modes of setting observable in different limes, but also for some of the more gradual actions which take place in that material, and the effects reciprocally produced by the mixtures of various ingredients. In the case of the now generally used Portland cements, and in that of underburnt lime, some very curious phenomena may however be observed, which appear to indicate that the simple laws mentioned above do not comprehend all the conditions which may arise; so that the above theory itself must only be considered as a step towards the attainment of a complete one of a more general character. The phenomena to which I thus allude are connected with the obscure subject of the chemical actions which take place under the influence of high degrees of temperature, and we shall have occasion to refer to them in the sequel.

#### The Treasures of Olympia.

E. CURTIUS.

The second temple in the order of size, though prior in time, is the Heraion, situated in the northern half of the Altis—a Doric temple, with six columns in front and sixteen on the sides. It has thrown new light upon the subject of the ancient temple architecture of the Greeks. Here is a building originally designed for the reception of votive offerings, and which accordingly had in the interior two rows of small chambers, like chapels. The entrance was in the southern long façade. In the lapse of centuries it was completely transformed, and we can see how the original wooden pillars were, one group after another, replaced by columns of stone. The entablature was probably always of wood, hence the extraordinary width (considering that the columns are Doric) of the intercolumniation of the portico. Henceforth the history of Hellenic architecture must begin from the temple of Hera at Olympia. Finally, the ground-plan of a third temple, surrounded by columns, has been discovered. This, the Metroön, or sanctuary of the mother of the gods, stood in the northern half of the Altis, just below the terrace of the treasures. This building we must regard as simply a place for keeping votive offerings. There were other buildings erected specially for the purpose of holding these votive offerings, namely, the *thesauroi*, or treasuries. Such buildings were familiar to us already from descriptions of Delphi and Olympia, but none had ever been discovered. Now the entire row of treasuries described by Pausanias is exposed to view, their main features preserved so far as they escaped ruin in Roman times. They were edifices built after the manner of temples, and two of the more important of them—namely, the treasury of the Syracusans, erected by them after the siege of Carthage, and that of the Megareans—are easiest recognised. The latter building had

one of its pediments decorated with a representation of the war of the giants, and of these sculptures considerable remains have been found. They display a style more ancient than that of the *Æginetæ*, and add materially to our knowledge of temple sculpture. Among the treasures must also be classed the Philippeion, the rotunda of marble built by Philip of Macedon after the battle of Chæronea, and which was filled with statues of his family. This is the oldest Grecian round temple whose date we are able to determine. Its ruins are in a tolerable state of preservation, and lie to the west of the Heraion, while to the east of the same the remarkable structure built by Herodes Atticus has intruded itself among the treasures. It occupies a semicircular niche cut into the foot of Mount Kronion, and was designed to hold a series of twenty-one marble statues representing the families of Antoninus Pius and Herodes Atticus. In two projecting round temples were statues of Antoninus and his wife Faustina. In front of this building there was a large walled basin, from which spring-water from the hills in the rear was conducted through the Altis. On the margin of this basin stood the figure of a bull, on which Regilla, wife of Herodes, had an inscription carved, to the effect that she, as priestess of Demeter, had consecrated the waterworks to Zeus. The building was an imposing structure, erected in the year 170, but it was impossible to complete it without injury to the treasures on each side. There is no doubt that one of the most notable buildings of Olympia, the double treasury of the Sikyonians, was destroyed to make room for it.

#### The Pont de l'Alma, Paris.

F. FOWKE.

The piers of this bridge are founded on concrete and masonry, laid by means of caissons, and such was the rapidity with which the rubble work of the arches and spandrels was executed that but three-and-twenty days elapsed from the time of commencing the springing of the arches until the opening of the bridge to the public. It must, however, be borne in mind that this opening for traffic took place before the ashlar facing was applied (this not having been carried up simultaneously with the rubble), before the centres were struck, the footpaths paved, or the parapets commenced. One of the most interesting points in connection with the construction of this bridge is the method employed for striking the centres by means of cylinders filled with sand; the employment of this method does not produce the slightest change in the construction of the centring itself, as the cylinder is simply substituted for the wedges on which the centres are supported. The apparatus consists of a cylinder of wrought-iron, 12 inches in diameter and 12 inches high, which is placed in a vertical position on a wooden platform, on which it is prevented from slipping by a circular piece of wood,  $\frac{3}{4}$ -inch thick, nailed to the platform, and fitting the interior diameter of the cylinder. Near the base of the cylinder, at four equi-distant points of its circumference, are bored holes an inch in diameter, which are stopped by corks introduced from the interior of the cylinder, which is then filled to within 2 inches of the top with sand previously dried and passed through a fine sieve; and into the space thus left is fitted a solid piston or plunger of wood, coinciding exactly with the interior diameter of the cylinder, and about 10 inches high; the whole apparatus, which is thus about 20 inches in height, is then introduced under the centres in lieu of wedges; and M. Bouziat, by whom this method has been invented and applied, gives the following account of the process of striking the centres:—"In striking centres, at a given signal, the corks closing the orifices in the cylinders are withdrawn by an iron rod a foot long and 0.31 of an inch in diameter, pointed at one of its extremities, and flattened and turned up at the other; the sand then issues slowly until it has formed a little cone opposite each hole, and stops. When everything is ready, the engineer gives the order to lower from  $1\frac{1}{2}$  to 2 inches; then, by means of the iron rods, the men remove the cones of sand, and help its escape with the curved end in the event of its having got wet during the process of the work, until the piston shall have descended the distance required, which will be noted by a scale attached to each piston. The workman then allows the little cone of sand to accumulate, and waits a fresh signal, and in this way the centre descends gradually, and detaches itself uniformly from the arch without shaking it. It will be seen that, being completely master of the operation, leisure is given to make all necessary observations, so as to be assured that all goes on well, or to take measures should the contrary be the case. At the Pont d'Austerlitz, commenced May 20, 1854, and opened for traffic on November 8, the centres were struck in two hours, and it might have been performed in still less time by placing a man to each of the cylinders, so as to lower all the centres simultaneously. Each arch of the bridge was supported by thirty-six principals, and the enormous weight of both the masonry of the arch and the metal of the roadway bore on the centres, they not having been removed until after the opening of the bridge to the public."

## NOTES AND COMMENTS.

M. JOSEPH ALBERT TOURNAIRE, a pupil of M. ANDRÉ, has been the enviable winner of this year's Prix de Rome for architecture. He is a native of Nice, and was born in 1862. M. SORTAIS, who is two years older, has gained the second grand-prix. He also obtains the consolation prizes of 2,000 and 500 francs. M. HUGUET was third in the competition. The subject assigned was a legislative palace. After his residence of four years in Rome, M. TOURNAIRE will receive 3,000 francs a year for three years—being a prize that was founded by the Countess of CAEN, who believed that assistance was never more welcome to an artist than during his early years of practice.

A CATALOGUE of engraved gems in the British Museum has been compiled by Mr. A. H. SMITH, in the Department of Greek and Roman antiquities. The bulk of the collection, over two thousand pieces, was formerly the property of the Duc de BLACAS, and of Signor ALESSANDRO CASTELLANI. It is now exhibited in the room adjoining the Department of the Coins and Medals. The Duke purchased the whole of the Strozzi collection, from Rome. The finest specimen in the collection is a head of AUGUSTUS, a sardonyx  $5\frac{1}{4}$  inches in length by  $3\frac{3}{4}$  inches in breadth. The ground, or layer of the stone out of which the head rises, is of a fine russet colour. A head of MEDUSA forms the centre of the shield which covers the breast. The Emperor has a band or fillet round his head, on which are various precious stones.

It is expected that the room in the Barbizon farmhouse which served as an atelier for J. F. MILLET will not be destroyed like the other parts of the house, but will be converted into a museum. But it can only have a circumscribed interest. Admirers of the painter will hereafter like to know what kind of rooms served for him during the time when he was not at his easel. The atelier is not the most interesting part of the house at present, and, when standing by itself, it will be simply a prosaic room. If the French Government interposed, the whole house could be saved; but that course will not be followed, as MILLET was never an official painter.

A MELANCHOLY account of the state of the woodwork in the Government House, which the Viceroy with his party was to occupy on the occasion of his visit, was furnished by a correspondent in Simla to a Bombay paper. The pillars supporting the galleries are of deodar instead of in teakwood, as they ought to be, and are all split and rotten-looking; the doors are falling asunder, or have never been properly fixed together; the window-frames, mantel-shelves, doorposts, lintels, pillars, and panels are all slanting in various degrees and directions, but are in many cases "off the level" to a very marked degree. The flooring is good in the Viceroy's study only. Everywhere else there are great gaps between the boards, in some of the staircases so wide as to admit of a finger being thrust between the planks.

THE Commission on Historic Monuments in France, of which PROSPER MERIMÉE was the first director, has exercised a sort of despotic sway over all the ancient buildings in France which can be supposed to possess an historic interest. Last year a law was passed which conferred on the Commission a control over buildings and other structures of less importance. An inventory is to be made—with or without the consent of the proprietors—of the objects which have any historic interest, and although the preservation or restoration of them does not devolve upon the State, it will be illegal for any one to alter them or repair them without the sanction of the Minister of Fine Arts. Furniture may be included among the historic works.

THE Parliamentary Buildings Commission of Melbourne lately recommended that Mr. KERR, who is the architect-in-chief at Parliament House with a salary of 600*l.*, should receive an addition of 400*l.* a-year on account of his work in connection with the new buildings. The Public Works declined to approve of the recommendation. The Parlia-

mentary Buildings Commission therefore resolved to solicit the Government to place a handsome sum on the Estimates as a gratuity to Mr. KERR, who has for many years back rendered eminent services to the State. The Commission also resolved to proceed at once with the carrying out of the alto-relievo designs by Mr. MACKENNA, awarding premiums to the following competitors for sculpture:—Bronze lion: First premium, 50*l.*, Mr. J. S. MACKENNA; 25*l.*, Mr. F. W. COMMONS. Allegorical figures: First premium, 40*l.*, Mr. M. B. FORTI; second premium, 20*l.*, Mr. E. R. KRETZSCHMAR. Alto-relievo panels: First premium, 20*l.*, Mr. A. B. MACKENNA; second premium, 10*l.*, Mr. E. R. KRETZSCHMAR.

A PORTRAIT of Queen MARGHERITA of Italy, painted and burnt in on glass by Professor MORETTI of Perugia, has been added to the many attractions of the Italian Exhibition in London. It has taken the artist two years of constant labour to complete this masterpiece, and the King and Queen of Italy on viewing it personally congratulated Professor MORETTI on his work.

M. BOSSAN, of Lyons, who died recently at La Ciotat, was the designer of one of the most remarkable of modern churches. We refer to Notre-Dame de Fourvières at Lyons. In size it exceeds the cathedral of that city. It was commenced in 1876, but owing to the liberality of the citizens it was soon completed. The style is Romanesque, but the architect was not hampered by precedents, and it cannot be denied that many details are over heavy. The interior of the church is rich in sculpture.

THE British consul at Mollendo has sent an account of the starting of a limited liability company for working the old burial-grounds of the Peruvian Incas, and the authorities in Lima have, it appears, granted a concession for the purpose. It is supposed that the grounds will yield treasure in the shape of antiquities, valuables, &c. The prospective company, or "Licensed Society of Tomb-Riflers," for that appellation has already deservedly been used to describe them, it must be supposed will be more interested in making a dividend than in conducting archaeological research. The only valid reason for such searches is that they are likely to be fruitful in archaeological discoveries, and add to the store of historical knowledge. Explorations cannot be carried on without funds, but those who contribute money look for quite another return than cash for their investment; neither can explorations be conducted archaeologically except by trained men.

THE unearthing of the ancient amphitheatre in German Altenburg, a town between Vienna and Presburg on the Danube, is proceeding. As we stated a week or two back, the peculiar growth of the corn led to the discovery. It was the opinion of Professor HAUSER, who is conducting the Carnuntum exploration, that the corn-field covered the site of an ancient amphitheatre, the varied shades of green in the growing corn marking out the elliptical lines of the structure under the ground. The bottom of the arena has been reached, and a pavement found in perfect condition, and a paved road leading to the camp of Carnuntum.

A MEMORANDUM on the proceedings which are advisable in places attacked or threatened with epidemics, which has been drawn up by Dr. GEORGE BUCHANAN, F.R.S., has been issued to sanitary authorities by the Local Government Board. It is stated that it is of more than common importance that the statutory powers conferred upon sanitary authorities for the protection of the public health should be well exercised by those authorities, acting with the advice of their medical officers of health. The memorandum relates to occasions of emergency. Therefore the measures suggested in it are essentially of an extemporaneous kind; and permanent provisions for securing the public health have, in express terms, been but little insisted on. It is to be remembered, however, that, in proportion as a district is habitually well cared for by its sanitary authority, the more formidable emergencies are not likely to arise in it.

"INK-PHOTO," SPRAGUE & CO., 22, MARTIN LANE, CANNON ST., LONDON, E.C.

HOUSE AT FALLOWFIELD, N<sup>o</sup> MANCHESTER - FOR DR. EMRYS-JONES.

EDWARD & FRANK HEWITT, Architects.

# ILLUSTRATIONS.

A COUNTRY VICARAGE, SAYERS COMMON, SUSSEX.

**T**HIS vicarage, which is now completed, has been erected for the use of the vicar of Sayers Common, a village a few miles from Brighton. It has been planned to afford as much convenient accommodation in accordance with the rules for parsonage houses laid down by the Ecclesiastical Commissioners as the funds available would allow; and as both this body and the Governors of Queen Anne's Bounty have contributed towards the cost, everything has been arranged to meet their requirements. The style is, as will be seen, an adaptation of the typical Sussex homestead pattern, the materials used being the local red bricks and tiles with oak barge-boards and fittings. The work was very satisfactorily carried out by Mr. NORMAN, of Burgess Hill, from the designs of Messrs. C. E. CLAYTON & E. BLACK, of North Street, Brighton.

HOUSE AT FALLOWFIELD, NEAR MANCHESTER.

**T**HIS house has just been completed for Mr. D. EMRYS JONES, and is situated in a finely-wooded position which adds considerably to the general effect. As will be seen from the plan all the entertaining rooms face south and west. It is from this aspect the drawing is taken. The external brickwork is built of picked white headers relieved with red Ruabon quoins—arches, strings, chimneys also being of red Ruabon. The plinth is formed of deep blue Staffordshire bricks, the roof being covered with EDWARDS'S red tiles, and ornamented with scalloped bands. The general contractors were Messrs. BROWN & SON, of Salford. The whole of the work (including internal fittings and decorations) was carried out under the superintendence of the architects, Messrs. EDWARD & FRANK HEWITT, of 9 Albert Square, Manchester.

## ARCHITECTURAL ILLUSTRATION SOCIETY. SECOND SERIES.

NO. 12.—SAN BERNARDINO, PERUGIA.

A SUBURBAN HOUSE.

VILLA RESIDENCE NEAR BELFAST.

**T**HIS house, now in course of completion for the Rev. FRANCIS M. GRAHAM, M.A. (Oxon), occupies an elevated site at the Knock, Belfast, overlooking the Castlereagh Hills. The materials used in its construction are red perforated bricks from the Ormean works, with stone dressings from the Dumfries quarries. The internal joinery work is carried out in selected yellow and pitch pine. The contractors are Messrs. H. & J. MARTIN, Limited, of Belfast and Dublin; and the architect, Mr. HENRY SEAVER, of Royal Avenue, Belfast.

HOUSE AND SHOPS, HEADINGLEY.

**R**ECENTLY erected on the Otley Road, these premises are fronted with hammer-dressed wall-stones with Harehills dressings, and were built for Mr. JOHN RAYTON by Messrs. W. THOMPSON & SONS, the revolving shutters being supplied by Messrs. ATTWOOD & Co. Mr. T. BUTLER WILSON, of Leeds and Harrogate, was the architect.

UNION OFFICES, BLACKBURN.

**T**HESE offices, which are now approaching completion, have been erected from the plans and under the supervision of Messrs. STONES & GRADWELL, architects, Blackburn. The design was selected in a competition confined to the architects in the Blackburn Union, Mr. HIBBERT, of Preston, being the architect called in to assist the guardians in making a selection. The plans received the approval of the Local Government Board without any alteration whatever being suggested. Provision is made

The buildings being erected at Sundridge Park are for Mr. W. Drown, and not for Mr. Deacon, as stated in description of illustration in August 3.

for the clerk to the union and for the relief (indoor and outdoor) of the paupers of the union. There is a large Board-room to seat eighty-one, including officers and reporters. Adjacent to this room are committee-rooms for rural sanitary authority, assessment purposes, &c. On the top floor are offices, store-rooms, &c. Caretaker's residence is also provided. The front and return is all of dressed stone, the remainder of brickwork with stone dressings. Glazed bricks have been freely used, both for exterior and interior walls. The whole of the floors are fireproof, finished either with granite finish, mosaic or wood blocks. The heating is by means of hot water on the low-pressure system. The ventilation is being carried out by Messrs. ROBERT BOYLE & SON. The works have been carried out by local contractors. The architects are at present engaged in designing the furniture intended for use throughout the building, and the whole is expected to be completed this year.

## GLASGOW ARCHITECTURAL ASSOCIATION.

**A**T the monthly meeting of the Glasgow Architectural Association last week, Mr. J. Keppie, president, in the chair, a paper was read by Mr. A. N. Prentice on Early English Architecture. Mr. Prentice observed that as there were few remains of Domestic work of that period, he would confine himself to the Ecclesiastical. Taking Lincoln Cathedral as his model, he gave an interesting description of the various characteristic features of the style. In his remarks he made special reference to the importance attached to the western doors. Naves, arcades, screens, pinnacles, the iron hinges, bases, and the round abacus were subjects of instructive remarks. He dealt with the sculpture work, showing its claims to artistic merit, and of its importance to the buildings where it was found, generally being part of the design. Mr. William H. McNab opened a discussion, which was taken part in by a large number of members. The paper was illustrated by sketches and photographs. A hearty vote of thanks was awarded to Mr. Prentice for his paper.

## EDINBURGH UNIVERSITY.

**T**HE sanction of the Edinburgh Dean of Guild Court has been obtained by the Senatus Academicus of Edinburgh University to remove the iron railings and parapet wall at the South Bridge front of the University buildings, to make the space between the parapet wall and the wall of the building up to the present line of the footways, and to pave the new surface with natural-faced Caithness pavement or nidded white Hailes stone. Alterations—though not of a structural character, and therefore not requiring the authority of the Dean of Guild Court—on the Chambers Street front are also contemplated. The three bays placed at intervals about the first floor level of that front will be scabbled over and polished, while the joints and beds will be rusticated to correspond with the beds and joints on the east front. The ornamental string, which at present extends only to the bay nearest the South Bridge, is to be continued along the whole length of the line. In giving warrant for the South Bridge work, Lord Dean of Guild Gowans remarked that it would effect an immense improvement. The plans had been prepared by Dr. Rowand Anderson.

## BRITISH ARCHÆOLOGICAL ASSOCIATION.

**I**N view of the forthcoming congress of this Association, which is to be held in Glasgow, a meeting of the committee took place on Friday evening. Mr. John Honeyman, F.R.I.B.A., presided, and there were present Archbishop Eyre, Rev. G. S. Burns, Sir Michael Connel, Messrs. Mitchell, Scott, Conbrough, J. Dalrymple Duncan, Black, and Marwick. The Marquis of Bute, president of the Association, it was stated had received intimation that the Queen and the Prince of Wales had consented to become the patrons of the Glasgow Congress.

The draft programme of excursions and meetings was gone over and approved. On Monday, August 27, there will be a brief reception in the City Chambers, after which the visitors will proceed to Langside, where the Lord Provost will hand over the custody of the Battlefield Memorial to the Preceptor of Hutchesons' Hospital. The members of the Congress and others will be entertained to lunch by the Langside committee. The cathedral will be inspected, and its architectural features described by Mr. John Honeyman, president of the Glasgow Archæological Society. The opening dinner will take place in the evening. On Tuesday the party will proceed by train to

Bothwell Castle, and a visit will also be paid to Bothwell Church. The members will then go by train to Craignethan Castle, the "Tillietudlem" of "Old Mortality," on which a paper will be read by Mr. J. Dalrymple Duncan, F.S.A. Scot. At the evening meeting the inaugural address will be delivered by the Marquis of Bute, K.T., president of the Association. On Wednesday members and their friends will proceed by train to Larbert, where carriages will be ready to convey them to inspect the Tapock Broch, which will be described by Mr. Dalrymple Duncan. They will then drive over the Battlefield of Bannockburn to Stirling, where the castle, church, Argyle's Lodge, Mar's Work, and the other antiquities will be examined. Return to Glasgow by train in time for evening meeting in Corporation Galleries for the reading of papers. On Thursday the party will proceed by steamer to Rothesay. On arrival the ruins of the castle will be inspected and described by Rev. J. K. Hewison, M.A., F.S.A. Scot., and Mr. E. P. Loftus Brock, F.S.A. The members and their friends will afterwards be entertained to lunch at Mount Stuart on the invitation of the Marquis of Bute, president of the Association, and arrangements will be made to visit the standing stones of Lubas, the vitrified fort of Dunagoil, and the chapel of St. Blane. On Friday members and their friends will proceed by train to Paisley, where the abbey will be inspected, and its architectural features pointed out by Mr. E. P. Loftus Brock, F.S.A. The party will then return to Glasgow, and visit the collection of antiquities in the Bishop's Castle and the Hunterian Museum. Evening meeting in Corporation Galleries for reading of papers. On Saturday members and their friends will proceed by train to Doune, where the ancient castle will be inspected, and a paper on its history read by Mr. Dalrymple Duncan. The Roman Camp at Ardoch will then be visited and described by Professor Young, and by invitation of Mr. Matthew Bulloch the party will be entertained to luncheon at Ardoch House. An examination of Dunblane Cathedral, under the guidance of the Rev. A. Ritchie and others, will conclude the day's programme. On Monday members and their friends will proceed by train to Bonnybridge Station, whence the party will follow on foot the line of the Antonine Wall to Falkirk. From Falkirk they will go by train to Linlithgow, where the ancient palace and church will be visited and described. Closing meeting in Corporation Galleries at 8 P.M. On Tuesday, September 4, the party will visit Dunfermline, and in the evening the Association will be entertained at a conversazione by the Town Council of Glasgow in the Corporation Galleries.

#### PERMANENCY OF WATER-COLOURS.

SOME further notice of the report by Dr. Russell and Captain Abney in its scientific aspect may be interesting. In the analysis of white light by the prism, besides the radiations which are visible, and which are called "light," there are other radiations which co-exist with the visible radiations, and though invisible to the eye may have to be taken into account. Of these invisible radiations some lie beyond, or, as it is generally termed, below the red in the spectrum, and some beyond or above the violet. Those which are below the red, and have a longer wave length, experiment has shown to possess more energy or capacity of doing work than all the radiation ("light") above the red. As to how the comparative energies of the radiations, visible and invisible, forming the spectrum can be measured, it will suffice to say that by allowing the different parts of the spectrum (light and dark) to fall on an undecomposable substance (lampblack) which can absorb them all, or very nearly all, the measurement by thermo-electric means of the rise in temperature of the lampblack produced by the different parts of the spectrum gives a comparative measure of the energy of radiation of these parts. It must be remembered that the energy of the slice of white light decomposed by the prism, and which includes the invisible radiations, is the sum of all the energies of the different radiations of the spectrum.

The diagrams given in the report serve to explain the measurements. They show, for instance, the comparative energies at different parts of the spectrum of sunlight, the electric (arc) light, and an incandescent light which is the same as that of gaslight; the luminosity of the different rays of the spectrum of sunlight on a day in July, of the electric light, and of gaslight, showing the comparative brightness to the eye of the light at the different parts of the spectrum.

In the scale for the electric (arc) light is seen the portion of the curve of the visible part of the spectrum, together with its luminosity curve, showing that the brightness of the visible spectrum bears no sort of relation to its energy. The brightest part of the visible spectrum is in the yellow; whilst the point of maximum energy is just below the red. Had the luminosity and energy curves of any other source of radiation been used, exactly the same result would have been arrived at. Dark rays, when falling on a pig-

ment, behave in exactly the same manner as those which are visible; some disappear, and others are transmitted, and, though they give no colour to the pigment (it would appear of the same colour if they were excluded), are just as much in the reflected light as those rays which are visible. The light which is transmitted through a pigment is of the same general character as that reflected, and the same holds good for the dark rays. By the scale drawn up in the report an idea is given of the total rays which are transmitted and reflected by Prussian blue and carmine as measured, not by their brightness but by their energies, and it is seen that in the Prussian blue there are very few rays in the red, yellow, and green, which are transmitted and consequently reflected, but that in the dark rays again there is a transmission of radiation. In the case of carmine more of the red is transmitted, and less of the dark rays. The energy existing in the invisible region beyond the violet is very small, but since all radiation consists of a wave motion in what physicists have called the ether, it may happen, and does indeed happen, that the wave period of this portion of the spectrum is of such a nature as to cause a destructive vibratory motion on the atoms of the molecules of the pigment on which the light falls. This action had to be considered. All radiation, visible and invisible, is not reflected or transmitted through the various pigments, and the question arises as to what has become of the rays which are apparently lost. The radiation, which is not reflected from the colouring matter, has disappeared in passing through it; in other words, the pigment has absorbed certain of the radiations, visible and invisible, and with close approximation to the truth it may be said that the rays absorbed are complementary to those reflected. Hence in Prussian blue the rays absorbed are principally in the dark part of the spectrum, and in the red and yellow, and partly, but in a minor degree, in the green, blue, and violet. Similarly in carmine, the rays absorbed are principally in the dark part, the yellow and the green, of the spectrum, and less in the blue and violet of the spectrum. In the case of any body absorbing radiation, the energy so disappearing does work in that body, and in the case of chemical compounds, such as nearly all pigments in use are, there may be besides a chemical decomposition, which in colour means a fading or alteration. In estimating the chemical action effected on a body by radiation, there are two factors to be taken into account, viz., the intensity of the radiation acting, and the time during which it acts. To obtain the same amount of action in two cases, the product of these two amounts must be the same. Thus, if a certain tint be exposed to an intensity of radiation which may be called 100, and bleaches in it, say, one hour, then if a similar tint be exposed to an intensity 1, it will require 100 hours' exposure to it to effect the same bleaching. This has been fully proved by experiment. There is an idea abroad that if the light be very feeble a bleachable colour, no matter what length of exposure be given, will not fade. This, however, is not the case. The same proportion of the total energy absorbed by the body which, with an intense radiation, effects chemical decomposition, is expended with a feeble radiation in doing the same kind of work. To appreciate this, allusion is made to what the deductions from scientific experiment led the investigators to believe was the manner in which light acts on the molecules of which a body is composed.

In a compound body, the molecules must at the very least consist of two ultimate atoms, and these oscillate to and fro from one another, each atom having its own constant time of completing an oscillation, the molecule itself oscillating in a period of its own. The time of these oscillations is not to be measured even by millionths of a second, nor the extent of the oscillation by the millionths of an inch, but by standards far smaller. A ray of light of any pure colour is due to a continuous series of oscillations or waves of a known and measurable length in the physicists' "ether." If it happens that the time of oscillation of some "light" wave agrees with the time of oscillation of one of the atoms, the length of swing of the oscillation of this last is increased with each beat of the ether, till, if the number of beats of the ether be sufficiently numerous—that is, if the light be allowed to play upon the molecule long enough—the length of its swing is increased till finally the atom will swing off from the molecule, thus changing its composition. This liberated atom may join itself to the molecule of some other matter which may be present, such as oxygen or water. The amount of increased swing the waves of light can give the atom depends on the amplitude of the waves (the amplitude in a wave in the sea is the height from trough to crest), the square of which is a measure of their energy as it is of the intensity of the light. To take a very familiar example, suppose we have a heavy church bell hung without any friction on its supports, and without any resistance to its motion, and that when vibrating freely it would make a complete swing once in a second. Suppose to the end of the bell rope was attached a small horizontal plate, and that at intervals of a second 1,000 grains weight of water fell from a fixed height on to the plate, the bell would gradually oscillate.

and finally the oscillations would become so great that it would ring. If instead of 1,000 grains falling from the same height we had one grain of water falling every second it would take 1,000 times longer before the bell rung, and if it was  $\frac{1}{1000}$  of a grain of water that fell every second it would take 1,000,000 times as long before it rang. The work done by the dropping water may be looked upon as the work done by the amplitude of the wave, and the church bell as the atom, moving without friction and without resistance.

It will also be noticed that it is only those rays whose waves beat in unison with the oscillation of the atom which increase the swing of the atom. The wave motion is then destroyed, and that particular ray disappears, *i.e.*, is absorbed. It must be recollected that the visibility of any change effected on a body merely means the number of molecules altered. In feeble light the numbers altered in a given time are much fewer than when light is intense. We have a good instance of this in a photographic plate, where the effect of the exposure for  $\frac{1}{100000}$  of a second to sunlight on a salt of silver is invisible to the eye, whilst a second's exposure is rendered visible. We know, however, that  $\frac{1}{100000}$  of a second's exposure to sunlight has chemically altered some minute portion of the silver salt on which it fell, as what is termed development proves it. Again, we have a further definite proof in the case of certain colours that the smallest intensity of radiation if sufficiently prolonged effects a chemical change in them. In photographic processes the chloride of silver is only sensitive, roughly speaking, to the extreme violet of the visible spectrum. When any one of certain colours which are fugitive are applied to stain the silver chloride, and the part of the spectrum which the colour absorbs is below the violet, then after exposure in the spectrum on applying a developer, as it is called in photography, the action of the spectrum in decomposing the colour of the dye is shown by a deposit of silver taking place in that part which the colour absorbs. Thus, if carmine (cochineal) be applied to the chloride of silver an action will be shown to take place in the green where the colour, as will be seen, absorbs. It must be remembered that without that colour no such deposit would be possible. The spectrum of sunlight will cause this phenomenon to appear in a few seconds, and the spectrum of skylight, or of candle-light, will equally cause it if the exposure is prolonged. That is to say a feeble radiation (light), if sufficiently prolonged, will give the same effect as a radiation (light) which is several thousand times as intense. And it further demonstrates that chemical decomposition takes place in a colour long before such change is visible to the eye.

The heating effect on a body may be taken to be an increase in the amplitude in the oscillations of the molecules rather than of the atoms (though the two are closely-connected), pointing to the fact that the shorter wave-lengths which have a greater rapidity of oscillation are those which would be most likely to increase the amplitude of the oscillations of the atom and thus to produce a chemical change in the body.

In analysing by a prism the different kinds of light, it is found that in the visible spectra so obtained no colour is absent, but on comparing the intensity of the same colours in the different spectra it is found that there is a variation. Comparing the spectrum of sunlight at midday in May with gaslight, it is found that there is considerably less violet, blue, green, and yellow light in the latter than in the former, and in light from a blue sky considerably less red and yellow. The intensities of the spectrum colours of sunlight near midday in May are not very different from those of the electric (arc) light, while the intensities of the colours of the incandescence electric light when rendered normally incandescent are a very close approximation to those of gaslight. The light of the gas, and therefore of the incandescence electric lamp, is yellower than that of sunlight, and therefore of the electric (arc) light, owing to the increasing diminution of comparative intensity of the colours from red to violet, whilst the light from the sky is considerably bluer than that from the sun. It has been recently shown how by cutting off the electric arc light (or from sunlight of known composition) the proper proportions of the different spectrum colours, the exact hue of gaslight or skylight can be produced. The difference in hue of the light from any of the sources considered is due to an excess or defect, but not to a total absence of intensity of the different parts of the spectrum. As regards the dark rays of the spectrum the same argument holds good. A diagram is then given which shows clearly the different proportions of dark rays in sunlight, the arc light and gaslight. In light from the blue sky the proportion of dark rays is much smaller, and no very accurate measurement of their intensity has been made, but as the rays below the red do not cause chemical change in any of the pigments tried, this want of accurate knowledge is of no great moment.

Since, then, all sources of light emit the same rays, but of different intensities, which can be measured, it follows that if we know which rays are chemically active, and the amount of work which, when of a certain intensity, they perform, we can,

from the work done by the light from one source, deduce the work that would be done by another. The most perfect manner of noting the action of light would be to expose for a given time the pigments to the action of the spectrum formed by an unvarying source of light, and to measure the amount of chemical action (fading of the colour in most cases) which had taken place in every part of the spectrum. When the relative intensities of the different parts of the spectra from other sources of light compared with this standard spectrum were known, then the length of time during which it would be necessary to expose the colour to any one of them to produce that same total effect could be calculated. Unfortunately for the experiments, even in full sunlight, which is the most powerful light to be worked with, months are often required to effect a visible chemical action on some of the pigments; it was therefore useless to take a narrow slice of light, say  $\frac{1}{10}$  inch in width, and  $\frac{1}{2}$  inch in height, and form a spectrum with it on a surface of coloured paper 4 inches in width and  $\frac{1}{2}$  inch in height, and wait to see when the bleaching took place.

To avoid this impracticable method resort was had to the use of coloured glasses to ascertain the part of the spectrum which was most active in producing the fading action. The glasses used were red, green, and blue. It may be well here to say something regarding what is meant by the terms red, green, blue, &c., as applied to glasses. It is a very popular idea that light coming through coloured glass is really white light, which is in some way transmuted into red, green, blue, &c., as the case may be. There is no transmutation. The effect of colour is merely produced by the abstraction of certain rays, or of a proportion of them, from the white light by the material of which the glass itself is composed.

In this case practically the visible spectrum was divided into three parts, and in every case where any fading took place it was always found beneath the blue glass, very much less often and to a far less degree under the green, and only twice under the red glass, and was then barely perceptible. The blue glass also allows most of the dark rays beyond the violet to be transmitted. Experiment has shown that these rays are chemically active, but not to the same degree as those which are visibly transmitted through the blue glass. This might be expected, as their energy or capacity of doing work is far less.

As to the proportion of dark rays which pass through the different glasses, they are nearly entirely transmitted through the red glass, very slightly through the blue and green glasses. Had the fading of the colours we have examined been due to the dark rays, it ought to have been shown beneath the red glass far more than under the green or the blue glass. This was not. Therefore, it may be said that the blue, violet, and ultra-violet rays are those which are by far the most active in producing a change in the pigments experimented on. As the intensity of the different rays of the spectrum coming from the different sources of light have been measured, it follows that the total intensity of the rays from each source of light transmitted through the blue glass can be calculated. These total intensities may be taken as a close approximation to an inverse measure of the time to which the colours would have to be exposed to produce an equal result as regards fading.

It might properly be objected that although it has been shown that the dark rays do not affect chemical decomposition, it has not been proved that the heating effect they have on a pigment might not aid the rapidity with which the decomposition takes place. Direct experiments were undertaken with this object in view. The backs of papers coloured with pigments proved in the investigation to be fugitive were placed in contact with a tin containing boiling water and exposed to light, together with similar papers merely resting against wood. Some few of those colours which are affected by heat without light in an atmosphere saturated with moisture did fade with very slightly greater rapidity where exposed as above, but with the majority the rate of change was, if anything, slower. Further experiment has also shown that if the dark rays be cut off from sunlight by proper means, the rate of fading in colours freely exposed is not diminished. In the experiments in the open tubes, which were described previously, the temperature was only a very few degrees higher than the temperature of outside atmosphere, and therefore the experiment made by heating the pigmented paper by contact with a vessel at the temperature of boiling water was an extreme example of the effect of heat. The results of experiments show that damp is often a factor in the rapidity of fading, and as heat tends to lessen the moisture present in the paper and pigment, it might be expected that in the majority of cases fading would result more slowly when the pigment was heated, whether by radiation or by heat applied as above.

That fading should principally take place in the blue rays was to be expected, from experiments that have been conducted with other objects, and is of great practical importance. It has been already stated that it is only those parts of the spectrum which are absorbed by a colour that can do work on it. Of all colours, the reds, yellows, and greens absorb principally in the

blue part of the spectrum, and the blues much less. Hence we may expect that the former pigments would fade more rapidly than the latter if they are fugitive. And, what is more important, it locates the action of the spectrum to the region which is least luminous, and which varies enormously in the different kinds of light to which pigments are exposed. Of the different kinds of daylight, viz., sunlight and skylight, to which water-colours are exposed, sunlight is the safest when reduced to equal intensity, since it contains a far less proportion of blue light than does skylight.

From a consideration of the amount of exposure given to the pigments is deduced, within limits, the time that would be taken to produce a similar effect in the light to which they would ordinarily be exposed. Between the middle of May to the middle of August, that is, from the time when the exposures were first made to the time when the first series of readings were made, there was registered at Kew Observatory 705 hours of bright sunshine, and at Greenwich 652. We may therefore take it that there were about 675 hours of the same bright sunshine at the place in which our colours were exposed. Not only, however, did they receive this sunshine, but also the light from the sky. The total number of hours of effective daylight which they received in the same time was about 1,700 hours. A fair comparison can be made between sunlight and skylight from the results obtained by experiment. When the sun is bright, we may take it that the sky is not overcast, but is fairly clear, and if, by photometry, we may measure the brightness of the total light from the sky and of sunlight, and of the skylight separately when illuminating a surface placed vertically, and facing the direction towards which the papers were exposed, we can calculate the ratio of the brightness of sunlight and skylight. It would be manifestly of little use to take measures of the whole of the components of the light, for, if we take a unit of light of blue sky and a unit of sunlight, we have much more blue light in the former than in the latter. And, as it is the blue rays that have been shown to be effective in acting on those pigments which do fade, the photometry had to be confined to these rays alone. The average intensity of the blue rays in direct sunlight (*i.e.*, with the receiving surface held normally to the direction of the sun's rays, is attained very nearly at 330; thus in the middle of August it is about 63 of that of the maximum. In the case of the tubes, however, the pigments were not exposed, so that the surface was normal to the direction of the sun's rays, but always with the surface vertical. As they were cylindrical, it might, at first sight, have appeared to be a matter of some difficulty to say whether the photometric measurements should be made with a vertical surface facing east, south, or west. A reference to the tubes themselves, however, solved the question, as it was found that the greatest fading took place in that part of the paper which was parallel to the building against which the tubes were hung, and it was this direction in which the surface of the photometer to be illuminated was placed. The conditions of exposure required that the effect should also take into account the reflection from the glass, and this was duly attended to. As a result, it was found that though the illumination by the sun near mid-day of a vertical surface facing 20 deg. east of south was on an average nearly 4.5 times more intense in blue light than was the sky, yet there was a steady diminution in the ratio after about three hours on each side of when the maximum was attained, owing to the greater inclination the paper had to the solar rays and also to the increased reflection from the glass from the same cause. It may be fairly taken that the average intensity of the blue of sunlight throughout the day is close upon 275 that of the average light from the sky. Although the sun soon after its rising shone upon the pigments, yet at about 3.30 in the afternoon they were shaded from the sunlight, and this reduces the number of hours' sun which they received to about 500 hours. The above average value of sunlight to skylight was taken with a knowledge of this fact.

The conclusion is thus arrived at that when the sun was shining for 500 hours, the pigments received blue light equal to 1,875 hours of that of a blue sky fully illuminated when the sun shone on them. Besides this, the pigments received 200 hours of blue sky towards sunset when the colours were in the shade, which may be taken as about equal to 50 hours of average skylight illumination. The light from a sky which is cloudy has very much the same composition as sunlight itself, as repeatedly proved. Supposing, however, that the light was half due to blue sky and half to that of sunlight, this is equivalent to the pigments being exposed for 600 hours to light of the same composition as that of a blue light from the sky and 600 hours to light of the same average composition as sunlight. Now for equal units of illumination skylight is almost exactly twice as rich in blue rays as is sunlight. Therefore, the 600 hours to which the pigments were exposed to degraded sunlight is equivalent to 300 hours of light of the quality of skylight. Hence it may be taken that the pigments were exposed when the sun was not shining to 900 hours of light of the same quality as that coming from the blue sky, but inferior in illumination. Measures taken

show that the light coming from the sky at the time of year when the exposures were made varies from  $\frac{3}{4}$ ths to  $\frac{1}{10}$ th, and sometimes less in brightness of that coming from an unclouded sky, the measurements being taken at the same time of day. If we assume that the average illumination of an overcast sky is  $\frac{1}{10}$ th of that of a blue sky, we shall not be far wrong. Applying this factor, we find that the pigments were exposed for an equivalent of 300 hours of average bright blue sky beyond that to which they were exposed when the sun was shining. It may therefore be said that the pigments received a total illumination equivalent to 2,225 hours of average blue sky, which is made up of the 1,875 hours, the 50 hours, and the 300 hours. This of course is only an approximate estimate, owing to the very variable quantities dealt with, but still it will give an idea of the illumination by the blue rays which were effective in causing the fading. A calculation is made as to the approximate amount of illumination which a picture hung in a gallery, such as those at South Kensington, would receive during the same period. No direct sunlight would be admitted, and therefore the illumination due to the direct light from the sun would be eliminated. Photometric measurements show that the blue light illuminating a picture in these galleries varies between  $\frac{1}{10}$ th and  $\frac{1}{20}$ th of that to which it (when no blinds are used for subduing the light) would be subjected if it were placed where our pigments were exposed and illuminated by the sky alone. When there is a blue sky the ratio is least, and we shall be safe in taking it as  $\frac{1}{10}$ th. For the 700 hours when the sun was shining we should, therefore, have an equivalent inside the gallery to about 9.3 hours of average blue sky. For the 1,200 hours of light from an overcast sky we may take the factor of  $\frac{1}{10}$ th both for the 600 hours of light which was of the quality of light from a blue sky, and also of the light for the 600 hours, supposed to be of the same quality as of sunlight, which, both together, were taken to be equivalent to 300 hours of light from an unclouded blue sky. This would give an exposure equivalent to 7.5 hours of the average light from a blue sky, such as that to which the pigments were exposed, or in all 16.8 hours. This would make the exposure of a picture inside the gallery about  $\frac{1}{130}$ th of that given to the pigments during the same time. If the whole year was of the same daily average brightness as that between May 15 and August 15, 1886, the same effect would have been produced on the pigments located against the walls of one of these galleries in about 32 years. Seeing that the daily intensity and continuance of light is so enormously diminished in the autumn and winter, it will not be overstating facts when it is said that it would have taken 100 years in the gallery in question to have arrived at the same degree of fading as to that to which the pigments had arrived by the sunlight experiments up to August.

A calculation is made as to the amount of exposure to gaslight, or light from electric glow-lamps falling on walls of the same gallery. The glow lamp and the gaslight have very closely the same composition, and it may be taken that the mean illumination on the walls lighted by gaslight and electric incandescence lamps is equal to two candles at one foot off. The illumination of the same galleries by daylight has been measured, and the mean light for the whole year may be taken at about six candles at one foot off. Details of the candle value of the illumination for the brightest months in the year have been given. The illumination in the winter months is so small that this average may be taken. That is, the mean illumination by day is three times better than by night, but the blue rays in one unit of the illuminating value of light of gaslight are only  $\frac{1}{10}$ th on cloudy days to  $\frac{1}{20}$ th on days when the sky is clear of those contained in a unit day light. We may take  $\frac{1}{10}$ th as a probable proportion, and on this assumption the blue light illumination by the latter is about  $\frac{1}{10}$ th of that of the former. That is to say, that one hour's exposure to mean daylight is about equal to 45 hours of gaslight. It has already been estimated that to produce the fading which took place in the colours between May and August in direct sunshine, at least 100 years would have been required had the exposure been made in the gallery. Allowing for the duration of darkness, it would have taken at least 2,000 years continuous illumination to have produced the same result in gaslight or in the light from the electric glow-lamps. With the arc electric light giving an illumination of 2½ candles at one foot off, we calculate, on similar data, that the same result would have been obtained in not less than 200 years.

#### THE CHANNEL TUNNEL WORKS.

A REPORT on the state of the Channel Tunnel works, made to the Board of Trade by Major Marindin, has just been published as a Parliamentary paper, being dated July 17, and is as follows:—

In compliance with the instructions contained in the order of the 5th instant, I have this day made an inspection of the

works of the Submarine Continental Railway Company, near Dover.

I was accompanied by Mr. F. Brady, the engineer of the company, who made all possible arrangements to facilitate my work of inspection.

I was informed by Mr. Brady that, although the boring machine, which is still in position at the end of experimental tunnel, has been periodically worked so as to keep the machinery in proper order, no cutting operations have been carried on except upon occasions when permission has been obtained from the Board of Trade.

I find that since the date of my last inspection, in December 1886, permission was given upon August 10, 1887, to work the machine upon the following Friday and Saturday (see H. 5,787), and the measurements taken by me to-day, compared with those taken in March 1885 and December 1886, show that only eight inches of chalk have been cut out since the latter date. This amount of cutting is not more than might reasonably be made under the above-quoted sanction.

The length of the tunnel having been thus increased by eight inches since December 1886, is now 2,102 yards 2 feet 8 inches, or, say, 2,103 yards.

The ventilating heading from the tunnel to No. 3 shaft, sanctioned by the Board of Trade on May 14, 1886 (H. 2,846), has not been commenced.

The tunnel, although a good deal of the timber sheeting at places has had to be renewed owing to dry rot, is in much the same condition that it was in December 1886, but, if anything, it is rather drier.

The pumps are worked twice a week for about three hours, and the amount of water which collects in twenty-four hours is calculated at only about 440 gallons.

The ventilation is carried out, as heretofore, by the use of compressed air whenever necessary.

The boring operations for coal on the under cliff close to No. 2 shaft are being pushed forward. The bore-hole from the bottom of a shaft 44 feet deep is now about 900 feet deep; the first 500 feet, 18 inches in diameter, being lined, and the remainder, 15 inches in diameter, being as yet unlined.

#### A Royal College of Architecture.

[SIR,—So our discussion upon the establishment of a national scheme of architectural education is to conclude, and I am afraid I am just as sceptical of its possibility as I was before it began. Mr. Thomasson's failure to explain away my objections has, I fear, made them doubly strong. Why does he not give us some details of the finances? Why does he not distinctly state who is to organise and carry out this scheme? And why does he not even attempt to respond to my invitation to form a local society for his own town? Because, sir, directly he tries to reduce his scheme to a practical workable form, he finds himself confronted by a host of difficulties. I know what they are, because I have gone through it all, and although I was just as eager and just as confident as Mr. Thomasson when I first conceived the idea, yet the enormous difficulty of carrying it out convinced me that such an organisation was not possible in the present state of architectural education. And this discussion has strengthened me in my conviction.

Nevertheless, now that the question has been fought out in words, and that my objections have not apparently shaken Mr. Thomasson's faith, let him turn his attention to deeds, and set to work to put his scheme into working order. After he has done so, I would suggest that he lay the whole matter before the Council of the Royal Institute of British Architects, where I am sure it would receive a very courteous reception and a complete and impartial investigation. And then, if I am proved to be wrong, I shall be the first to own it. I am sorry that Mr. Thomasson thought fit to write his last letter in the tone he did. We are fellow-workers in a good cause, and after all it is only the means, not the end, that we are disputing about. So now that our wordy war is over, let us metaphorically shake hands, and forget any hasty remarks that may have seemed to us uncalled for.

For ourselves in the Association, we also will continue our labours to perfect its organisation and make it a worthy college of architecture. As one little example, I may mention that next winter the committee is going to appoint a committee of inquiry to investigate the merits of a scheme of education in construction and architectural science that will, if passed, be of immense value to the profession as a whole, and then the youngest pupil will be taken in hand by competent teachers and trained on year by year, until he is able and ready to present himself for that final ordeal for which every true and loyal

architectural student is, I hope, preparing himself—the R.I.B.A. examination.

Believe me, Sir, there is a very strong feeling in the Association in favour of a more collegiate leavening of its institutions, and if your original correspondent would only lend us a helping hand in our endeavours, instead of starting a new college, I know he would earn for himself among our students a popularity great indeed.

In conclusion, I must give you, Sir, my very warmest thanks for permitting me to occupy so much space in your journal, but I hope and believe that this discussion will be of real benefit in showing to the world that Englishmen are at last determined to set their house of architectural education in order.—Faithfully yours,

OWEN FLEMING.

London: August 11, 1888.

#### Theatre Exits and Fire Risks.

SIR,—Having read your notice under the above heading which appeared in your issue of the 10th inst., I cannot help commenting upon the apparent belief, still reposed by theatrical architects and managers in materials which, though incombustible in themselves, are yet great absorbents of heat and subject to the influence of it. For instance, iron and concrete, though incombustible in themselves, are most pernicious materials when used in the construction of a building, particularly when the one is employed in conjunction with the other; and there is not the slightest doubt that the combination of iron and asbestos, when used as a fireproof proscenium curtain, though the action may be different when it is subjected to extreme heat, say in the case of fire, cannot possibly be effectual in preventing the spread of a conflagration from the stage to the auditorium.

It is a well-known fact that asbestos becomes incandescent when subjected to flame, and any material that can be rendered incandescent must be a conductor of heat. Iron when subjected to extreme heat rapidly expands, and, when built up into a kind of framework, very rapidly becomes distorted through unequal expansion; and I will say if a framework of iron and asbestos cloth be employed as a fireproof drop curtain for a theatre, that in event of fire the curtain will be rendered useless through "buckling" and warping.

It stands to reason that what really should be employed by theatrical architects and managers in the construction and fireproofing of theatres are articles which are not simply incombustible in themselves, but materials which will not become incandescent or transmit heat in such a way as to influence combustible materials in close proximity to them.

I need not say that such materials are at the disposal of any architect who wishes to make use of them, as that is now a well-established fact; but, obviously, what is required is to bring before the notice of those personally concerned, viz. the theatre-going public, the fact that theatres can (though at present they certainly are not) be made perfectly fireproof, and that there is no reason whatever why the life of a single theatre-goer should be risked.

PAUL LAMBERTS.

August 15, 1888.

#### Contrast or Harmony?

SIR,—The letter of your correspondent "In a Fix" draws attention to a subject which now and then forces itself upon observant minds. His case is that, having erected an extension to an Elizabethan house greater than the old part, with stone from the same quarry as that used in the old part, his client complains that, whereas the old work is of a beautiful dark-grey colour, the new is of a very light but agreeable tint, and proposes to reface the old work to match the new, or darken the new work to match the old.

Two or three years ago I was with some archaeologists in Sussex, and directed their attention to the following incident. There were, side by side, two fifteenth-century windows, in every minute particular of design and detail precisely alike. One was the original window, the other a new one put in by Sir Gilbert Scott, probably replacing the old decayed one. The old window instantly arrested attention, and we desired to sketch it, but the new one we should pass by as an ordinary piece of work. Now the whole secret of this was the effect of time. Time had mellowed down to a "beautiful dark-grey colour" the old window, while the new was comparatively harsh and bald. It, however, seemed to say, "And why not sketch me? What has my old neighbour done that you should bestow such loving glances upon him, and pass me by with contempt?" And so it can be said of many Elizabethan and Queen Anne houses. I suppose no one would be more astonished than the designers of those houses to find such praise bestowed upon them. The pleasure derived from them is not due to design, nor to building; it is wholly due to time. You may make at the side of any of them an exact counterpart, but you will not obtain a tithe of the beauty. Good old paintings are not better painted than good new ones; and when

time has flatted the varnish the present new ones will be as much glorified as the old ones. I said the same a little while ago in the columns of the *Times* as regards the work of Lord Grimthorpe at St. Albans Abbey. When time has mellowed down his new work it will look quite as well, and in many cases better than the old, but impatient persons demand the effect of three or four centuries in three or four weeks. The client of "In a Fix" should do what his predecessor did—let the work alone. To reface the old work would be to irreparably destroy its acknowledged beauty; to darken the new would be a sham which would make client and architect contemptible. The architect has done his work, the client has done his; let time do the remainder.—I am, your obedient servant,  
7 Duke Street, Adelphi, W.C.: WM. WOODWARD.  
August 15, 1888.

#### Italian Vandalism.

SIR,—The *Saturday Review* of last week, commenting on a pamphlet by Signor Antonio Palomes, entitled "Civilisation (?) Memoirs for the History of Our Own Times," draws attention to the numerous acts of vandalism which have taken place in Italy since 1865, and makes the astounding statement that during the past hundred years that country has certainly lost more than half of her ecclesiastical and civic monuments. The church of St. Dominic, at Brescia, which was pulled down in 1880 to make room for a new railway-station, supplied the Brompton Oratory with the sumptuous altar of the Rosary. The South Kensington Museum contains all that now remains of the church of the Misericordia and the fine conventual church of Santa Chiara at Florence. Palermo has suffered not only from the destruction of many of her finest churches, but from the injudicious restoration of those which remain. Signor Palomes assures us that there is a good deal of suspicious mystery hanging over those acts of vandalism, and he does not hesitate to hint that even conspicuous personages could if they chose tell us a good deal that is curious concerning the proceedings, and convince us that Mercury himself was the god who presided over many a sale of church and municipal plate. The English have been frequently reviled for the interest they have taken in the preservation of Italian antiquities, and it is satisfactory that this interest is shared by some of the Italians themselves, although unfortunately they are at the present time in a minority. J. H.

#### CHURCH BUILDING AND RESTORATION.

**Harrogate.**—The memorial-stones of a new Wesleyan chapel and school were laid at Starbeck, Harrogate, on Monday, August 13. The chapel is 41 feet by 31 feet, with vestibule and lobbies; the school 27 feet by 18 feet. The walls are of blue flag-stone with yellow sandstone dressings, and slated roofs. The roof, which is open, is 22 feet to collar. There are inlet fresh-air flues in buttresses, and vitiated air extractors on roof. The chapel gives accommodation for 200 persons, and the school for 70, at a cost of 850*l*. Mr. J. Sadler, of Starbeck, is the builder, and Mr. T. Butler Wilson, of Leeds and Harrogate, is the architect.

**London.**—The erection of the tower and spire of the church of the Holy Trinity, West Hill, Wandsworth, which has been in progress during the past twelve months, has been finally completed. The total height of the tower and spire together is 150 feet, the tower being 78 feet and the spire 72 feet, with handsome finial cross and vane rising another 10 feet. The lower storey of the tower is planned to form a lofty porch, groined and vaulted in Bath stone, and closed with handsome wrought-iron gates. On examination of the site and existing walls of the church, the architect deemed it advisable to build the tower independent of the church. It rests on a bed of cement concrete about 30 feet square and 6 feet thick. The south and east walls forming the inner walls of the church showed evidence of instability for the great weight to be placed upon them, and were taken down and rebuilt from the foundations, and the tower is, constructively, unconnected with the church. The walls at the ground level for 25 feet are 3 feet 6 inches thick and built in cement, and 3 feet thick above that height to the top. They are built of brick internally, faced with Kentish rag stone to correspond with the church, and Corsham Down Bath stone for the dressings. The spire is altogether of Bath stone, 18 inches thick at the springing and 9 inches above, the uppermost 10 feet being solid. Upon the top of the tower walls a course of York stone is laid as a bed course for the spire, and two wrought-iron chains run round the walls at the springing of the spire, which is additionally secured by two iron rods crossing each other diagonally. The contract was accepted by Mr. George Dobson, of Colchester, for 3,680*l*, the lowest of twelve tenders from known builders in London and the country. The work has been admirably executed, under the personal supervision of the architect, Mr. George Patrick, A.R.I.B.A., of Drummond Chambers, Adelphi, and

High Street, Wandsworth, the clerk of works being Mr. T. Shelmerdine. New vestries are to be commenced at a cost of over 500*l*. The wrought-iron gates to the tower were executed from the architect's designs by Messrs. Cottam & Willmore, and the vane, &c., by Messrs. Hart, Son & Co. The lightning-conductor was supplied by Messrs. Newall & Co.

**Oxford.**—The work of restoring the perished stonework of All Saints Church has been put in hand, under the supervision of Mr. Wilkinson Moore. At present it is proposed to restore the upper stages of the tower as far as the funds at the disposal of the vestry will admit. The upper portion of the spire was rebuilt as recently as 1873, but from the base of it downwards all portions of the facework show signs of being badly perished. Messrs. Symm & Co. are the contractors.

**South Shields.**—The Presbyterian Church in Mile End Road, South Shields, has been built thirty years, but during that time no minister has been properly heard in it on account of its acoustic defects. In the spring of this year the managers consulted Mr. John Wills, F.S.Sc., of Derby, well known for his experience in such matters, and, under his supervision, certain alterations have been made at a moderate cost, which have entirely altered the character of the building. It is pronounced to be a great success, and while the acoustic defect is cured the appearance is also very much improved.

#### GENERAL.

**H.R.H. Prince Albert Victor** has consented to act as President of the Great Northern Central Hospital, the new buildings of which were lately opened by their Royal Highnesses the Prince and Princess of Wales. Sir Andrew Clark, Bart., M.D., F.R.S., and Mr. Wm. S. Savory, F.R.S., have also joined the medical staff as consulting physician and consulting surgeon respectively.

**Mr. G. G. Hoskins, F.R.I.B.A.**, of Darlington, is the successful competitor for the Lynnfield schools, to be built by the West Hartlepool School Board, to accommodate 1,000 children.

**Plans** for proposed additions to All Saints Episcopal Church, Edinburgh, prepared by Dr. Rowand Anderson, have been approved by the Dean of Guild Court.

**Plans** by Messrs. Thornton, Shiells & Thomson, of Edinburgh, have been selected in competition for the proposed fever hospital, Duddingston.

**The Royal Commission** on the Metropolitan Board of Works on Tuesday adjourned *sine die*. The report will be made in a couple of months.

**A Party** consisting of members of the committee of the Leeds magistrates, and of the Corporation gas committee, has paid a visit to the works of the Leeds Forge Company. Mr. Sampson Fox showed them round the works, and explained to them in detail the plant employed and the mode of converting water into gas, which is used throughout the works for the purposes of heating and illumination.

**An Examination** of candidates for the offices of Municipal Engineer and Local Board Surveyor will be held at the Institution of Civil Engineers, Great George Street, Westminster, on Friday and Saturday, October 26 and 27 next. Applications for the examination must be sent to the secretary, Mr. Thomas Cole, not later than September 5.

**Plans** for the new Caledonian Railway passenger station in South Union Street, Dundee, were submitted to a meeting of the Police Commission on Monday. They showed a handsome building in the Scotch baronial style of architecture.

**A Swimming Bath**, 75 feet long and 35 feet wide, and said to be the largest brine-bath in England, was opened on Tuesday at St. Andrew's Brine Baths, Droitchich. The building was designed by Mr. Louis Sheppard, of Worcester.

**A Range of Buildings** in Kirkwall, comprising the North of Scotland and the Orkney and Shetland Steam Navigation Company's Offices, Tower's Hotel, and the old Orcadia Company's old chambers, has been acquired by a gentleman in Kirkwall, who is to erect a large hotel on a portion of the property.

**The Great Eastern Railway** have issued a tourist guide for the Continent. Though only sixpence in price, it has nearly 150 pages of matter and map. It is copiously illustrated throughout, and, apart from the exhaustive information as to means of travel, fares, accommodation, &c., it is worth getting by those who do not intend to travel, by reason of the interesting information and descriptions. It will prove of much value to tourists, without being an encumbrance either in the portmanteau or the hand.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

## LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

## TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

BANGOR: N. Wales: Sept. 14, 1885.

Considerably Reduced Price List, November 1, 1887.

## TRADE NOTES.

ALTERATIONS have been made at the Infirmary, Halifax, including the ventilation, Messrs. Robert Boyle & Son's latest improved patent self-acting air-pump ventilator being used for the extraction of the vitiated air.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his patent Manchester grates to Glanadda Schools, Bangor, Mr. R. Davies, of Bangor, being the architect.

THE firm of Morewood & Co., Limited, of the Lion Galvanising Works, Birmingham Heath, Birmingham, is, we understand, in the process of reconstruction, and will be carried on under the title of Morewood & Co.'s Successors, Limited. With an influential board of directors and better management, the firm should be able to take the position which they held some years ago for good materials, workmanship, &c.

ON Monday the Arbroath Town Council sanctioned reports by Mr. Mitchell, engineer to the Edinburgh Gas Company, and a sub-committee of the Board, recommending an extension of the works at Arbroath by the erection of an additional gas-holder, the laying down of a new main to the low-lying district of the town, the giving of additional purifying area, and the adoption of regenerative furnaces. The estimated cost of the works is about 8,000l.

BROOKSIDE WORKS, GODLEY, MANCHESTER.

ON Monday some of the joiners in Dundee, to the number of fifty-three, struck work for an advance of wages. Ten days ago, at a mass meeting, the joiners resolved to ask their employers to give them a rise of  $\frac{1}{4}d.$ , bringing up the standard rate of wages to  $7d.$  per hour. A week was given them to consider the matter, and the result was that the majority of the masters conceded the demand, while others refused to grant any increase. Several other masters afterwards intimated their intention to pay their men  $7d.$  per hour, while others offered  $6\frac{3}{4}d.$ , which was refused.

### WORKMEN'S DWELLINGS IN IRELAND.

THE report of the directors of the Dublin Artisans' Dwellings Company, Limited, for the past half year states that the cottages on the Bray site are in a forward state, and it is hoped that some of them will be occupied during this month. When the cottages at Bray are completed, the number of tenements erected will be 1,400, capable of accommodating 7,000 persons. The rental of property for the half-year ending June 30, 1888, was  $8,310l. 12s. 4d.$  as compared with  $8,243l. 4s. 8d.$  for the previous half-year, showing an increase of  $67l. 7s. 8d.$  The entire revenue for the half-year amounts to  $8,415l. 19s.$ , which, after providing for all expenses, will leave a balance of  $3,585l. 13s. 3d.$ , out of which is recommended a dividend at the rate of  $4\frac{1}{2}$  per cent. per annum, free of income-tax, absorbing  $2,222l. 15s. 7d.$ , and leaving a balance of  $1,362l. 17s. 8d.$  to be carried to depreciation fund, which will then amount to  $9,218l. 8s. 4d.$  The capital of the company is now expended in the purchase of the lands and the erection of the buildings from which the present satisfactory revenue is derived. The directors are of opinion that an extension of the operations of the company is most desirable, as there is still a pressing want of suitable house accommodation for the working-classes, more particularly the lower paid section of those classes. The company, which was formed in 1876, with a capital of  $50,000l.$ , paid its first dividend (3 per cent.) for the half-year ending June 1878, when 99 tenements were occupied. Its capital has since been increased to  $100,000l.$ , and  $83,167l.$  has been borrowed from the Board of Works. The dividend has been gradually increased to  $4\frac{1}{2}$  per cent., and the number of tenements stands at 1,400, covering 28 acres of ground. The directors have discharged out of the revenue account the entire of the preliminary

expenses ( $653l. 1s. 4d.$ ), also a sum of  $794l. 1s. 11d.$  for "offices and furniture," and have formed a depreciation fund which now amounts to  $9,218l. 8s. 4d.$  During the company's existence  $76,664l. 12s. 7d.$  has been collected in rents; for the same period the arrears amount to  $149l. 0s. 7d.$ , and the bad debts to  $182l. 9s. 3d.$

### MACCLESFIELD SEWERAGE.

THE Local Board of this town lately advertised an open competition to civil engineers for the best scheme for the interception of the sewage now flowing into the River Bollin, and its purification by the best known method. Mr. W. H. Radford, Assoc. M. Inst. C.E., of Nottingham, is the successful competitor. His scheme is to lay 6 miles of intercepting and outfall sewers to collect the sewage now flowing into the river, and convey it to an outfall below Prestbury. He then proposes to purify the sewage by irrigation on 159 acres of suitable land, specially laid out and drained for the purpose. The manufacturing refuse, consisting chiefly of soapsuds and dye-water, is also proposed to be dealt with. The population is 39,000, and the estimated cost of works only, without land or easements, is  $23,750l.$  Mr. Radford was also lately the successful competitor for the sewage schemes of Newhaven and Beaconthorpe.

### CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

ON Saturday Mr. A. T. Walmisley, C.E., awarded the certificates gained by the students of the Crystal Palace Company's School of Practical Engineering, the distribution taking place in the south tower of the Palace. Mr. F. K. J. Shenton read the report, which stated that out of 32 students who had attended the lecture examination on "Railways: their Construction and Appliances," 22 proved eligible for examination, and 18 satisfactorily passed. The result of the examinations in the various sections was of a most satisfactory nature. Mr. Walmisley, in addressing the students, said that the report showed that good work was being done in the school. He could speak with a practical knowledge, having examined in the civil engineering section two years ago. Civil engineering was world-wide in its work, and could claim to have done a good deal towards the civilisation of the globe. Mr. J. W. Wilson,

the principal, said the school had been established 16 years, and that was the 47th occasion upon which certificates had been awarded. Between 700 and 800 students had passed through the school, many of whom were doing well. He mentioned that seven or eight of their old pupils were now engaged as engineers in the construction of the Manchester Ship Canal.

#### EMPLOYERS' LIABILITY ACT.

A PARLIAMENTARY paper has been issued containing a return of the total number of cases tried in the County Courts in England, Scotland, and Ireland in 1886 and 1887. The total number of cases thus tried in England in 1886 was 161, and in 1887 170. The amount of compensation claimed in 1886 was 25,559*l.*, and the amount awarded 4,791*l.* In 1887 the amount claimed was 31,196*l.*, and the amount awarded was 6,669*l.* In Scotland the amount of compensation claimed in the period covered by the return was 59,888*l.*, and the amount awarded was 1,999*l.* In Ireland the number of cases tried was 28; the amount of compensation claimed was 3,430*l.*, and the amount awarded was 444*l.*

#### PAYMENT OF SUB-CONTRACTORS.

ON Friday, at the Liverpool Assizes, a case brought by Joseph Simpson (trading as Simpson & Co.), Darlaston, against Messrs. Neill & Sons, of Manchester, to recover 7,000*l.* for work and labour done as sub-contractor for the defendants at the new Liverpool Exchange Station of the Lancashire and Yorkshire Railway Company, was heard. The contractors at the new Exchange Station were Messrs. Neill & Sons, and Simpson sub-contracted for the ironwork. There were a number of matters in dispute, but the only question argued before his lordship was whether a certificate from the engineer of the railway company as to the work having been done was a condition precedent to the sub-contractor recovering the amount claimed, and whether a document put in was such a certificate. By the agreement the sub-contractor was to be paid when the engineer had certified. The company's engineer had certified to the contractors that the amount due by them to the sub-contractor was 2,100*l.*, and the plaintiff relied on this as a sufficient certificate so far as he was concerned, but not conclusive as to the amount he was entitled to. Messrs.

Neill asserted that he must produce a certificate, and also that the engineer having certified as to the amount due to him, his decision was final. In the agreements it was stated that all disputes were to be referred to the arbitrators, Sir John Hawkshaw and Mr. Sturgess Meek, and Simpson asked his lordship to decide that the document produced was a sufficient certificate to enable him to go to the arbitrators to have settled the final amount to be paid to him. The contractors paid into court the amount certified by the engineer as due.—His lordship said it was a strange thing that in cases of large contracts it invariably happened that some loophole was left in the documents for a legal question to be raised. His judgment would be for the sub-contractor upon a question whether or not a certificate had been given, and whether or not the parties had a right to ask the company to refer the matter to the arbitrators to see what further amount was owing. Judgment for 2,100*l.*, with costs, was then given, and any further amount will be settled by the arbitrators.

#### SANITATION OF TOWNS.

At the meeting of the British Medical Association, in Glasgow, a discussion took place on the subject of sewage disposal.

Dr. J. B. Russell opened the discussion by alluding to the history of the present position of the question of sewage disposal as it affected Glasgow. He then proceeded to describe the drainage area of the Clyde, and the successive steps which had been adopted in dealing with the sewage. The first common sewers, he mentioned, were formed in 1790, and the first water supply was taken from the Clyde above the town in 1806, supplemented from the same source in 1808. Till this time there were few water-closets in the city. In 1831 five miles of sewers were laid down in forty-five streets, extended to sixty miles in 1860. As sewers extended complaints of the state of the Clyde and its tributaries increased. The visitations of cholera in 1832, 1848, and 1853, showed that even two and a half miles above Glasgow Bridge the Clyde water had ceased to be fit for dietetic use. The Gorbals water, introduced in 1846, shielded that portion of the city from cholera in 1853. Loch Katrine water was introduced in 1859, and they had had no epidemic of cholera since. By 1849 the pollution of the Clyde had attracted public attention. It was remarkable

ADDRESS.

that the references to its condition in the *Glasgow Herald* of that date were couched in language quite as emphatic and as strong as any applied to the Clyde at the present time. The tributaries which distressed our forefathers had gradually been dealt with by making them sewers or by intercepting the sewage and conveying it direct to the Clyde. There were few cities in which more had been done to remove filth from the environment of the dwelling, but nothing of the sanitary operations of late years except the improvement of the streets and of the system of scavenging had advantaged the Clyde. The question remained, How was it that the offensiveness of the river had not increased? The probable answer was that the operations of the Clyde Trust had tended to dilute the sewage with a steadily increasing amount of impounded tidal water, and had also facilitated its removal seawards. The effect of these operations in expediting the removal of the sewage had been shown by experiments with floats. In 1858 a float took 43½ tides or 537 hours to reach Port-Glasgow, 19½ miles. For 1879 it took only 10 tides or 120 hours 40 minutes to reach Gourrock, a distance of 24 miles. The removal of the weir in 1881 somewhat reduced the rate of movement. Another fact which helped to explain why there had been no strong expression of public opinion in recent years was that by the extension of railway communication passenger traffic had been largely withdrawn from the upper Clyde. But the sewage question was not to be solved in this way. They would recognise the natural sequence of events when he stated that it had been transferred as a burning question to the lower reaches of the river. It began in the Molendinar. It was pushed into the Clyde, and now it had been partially removed to the Tail of the Bank and Loch Long. The 154 acres over which the Glasgow harbour and docks extended formed a settling pond from which last year 610,000 cubic yards of more or less foul deposit was dredged and transferred to Loch Long, at a cost to the trustees of about 6d. per cubic yard, exclusive of interest on plant. He stated that in 1858 Mr. Bateman condemned the system of precipitation, and recommended the construction of works similar to those then projected for London. The Town Council resolved to wait till London had showed the way. Messrs. Bateman & Bazalgette's scheme for conveying the sewage to the Ayrshire coast was next described, and also the proposal of the Royal Commission of 1876, presided over by Sir John Hawkshaw, that sewers should be constructed discharging at Farland Head, opposite the Little Cumbrae. The estimated cost of the

latter scheme was 2,500,000l. An endeavour to form a Board of Sanitary Commissioners of the Clyde by private Bill was unsuccessful, and Government had hitherto failed to implement a promise of general legislation for the purpose. In 1877 the Council came to the conclusion that the sewage, after being rendered clear by precipitation and filtration, should be passed into the Clyde, and Mr. Bateman suggested three schemes for this purpose. In 1881 the Sewage Committee adopted Mr. Bateman's scheme No. 3, by which the sewage of the north side was to be treated at Dalmuir, and of the south side at a point in the parish of Govan. Exclusive of cost of land and interference with property, this scheme was to involve an expenditure of 800,000l. on works alone. The annual charge for pumping was 3400l., and the cost of treatment and disposing of the sludge was roughly estimated at 40,000l. to 45,000l. a year. An idea prevailed that the removal of the weir would for a time make the sewage question less urgent. Partly under the influence of that idea and partly from the existence of so many administrative authorities, this scheme was not further considered. The removal of the weir had had no such effect as had been expected, though other circumstances had gradually tended in some degree to mitigate the nuisance at our own doors. There was some prospect of the extension of the municipality to include the whole populous area, and he had no doubt that one of the first questions which would engage the Consolidated Council would be the purification of the Clyde.

Dr. Alfred Carpenter, Croydon, read a paper on the same subject, advocating the utilisation of sewage on land by so-called "broad irrigation." In no single instance out of nearly one hundred cases in which sewage had been utilised by broad irrigation had any fact been proved to establish the allegations of "insanitary" which were sometimes raised against them.

Dr. C. R. Drysdale, London, contended that the only rational and satisfactory way of treating the sewage of cities and restoring the rivers to their original purity was by the method now used in Berlin, Paris, Croydon, Birmingham, Nottingham, and elsewhere—that is, agricultural utilisation on suitable areas and soils. The London Board of Works was a glaring instance of want of all plan in this question. For years past that Board, against the advice of Lord Bramwell's Commission, had gone on tormenting the dwellers on the banks of the Thames by pouring daily 150 millions of gallons of sewage in dry and 200 millions in wet weather into the river, and were now adding a greater absurdity, namely, the erection of two enormous tanks at Barking and Crossness, where a useless

experiment with chemicals was to be made. The tanks were to cost one million sterling, and the chemicals, &c., perhaps 100,000 a year.

Dr. T. J. Dyke, medical officer of health, Merthyr Tydvil, said that the local board of the town had adopted the process of Dr. Edward Frankland, known as the Downward Intermittent Filtration process, for disposing of their sewage. A site was chosen at Troedyrhiw, three miles below Merthyr, on the west bank of the Taff river; there, on a gravelly soil, Mr. Denton formed filtration areas on sections of land, by deep drainage, levelling of surface, and provision of an efficient outlet for the effluent water. Each area or section was flooded with strained sewage for six hours, and allowed to rest, to drain, and to be aerated for eighteen hours. The work was completed in the spring of 1881, and from thenceforth from one to three hundred thousand gallons of the strained liquid has daily been passed over and through the soil of the twenty acres of land so prepared. The work has been carried on without any injury to health. In 1872 and following years the surveyor to the board laid out 262 acres of land nine miles from Merthyr, and adapted the surface for this method of disposing of the sewage. The quantity disposed of on this land amounted to  $1\frac{1}{4}$  million gallons daily. The process is carried on without any detriment to health; and with regard to returns for labour and material, a fair profit has resulted. The total population of the several towns and villages connected with these sewage farms would be not less than 100,000.

Dr. Murray, medical officer of health, Forfar, described the system of irrigation adopted in that burgh. The quantity of land prepared to receive the sewage extended to about twenty-four acres on the estate of Orchard Bank. The outfall sewer is capable of delivering 2,000,000 gallons of sewage daily. The sewage is lifted 50 feet to the sewage farm by three 10 horse-power engines, capable of lifting 45,000 to 50,000 gallons per hour. The area of the land devoted to intermitted filtration is seven acres, leaving seventeen acres for surface irrigation. As to whether the scheme had been satisfactory from a sanitary point of view, he said the question could be answered without hesitation in the affirmative.

Dr. Wm. Whitelaw, medical officer of health, Kirkintilloch, said that the Kirkintilloch sewage works were drawing near completion, under the supervision of Mr. W. R. Copland, engineer. It had been found advisable, in order to minimise the cost of pumping, to construct two main outfall sewers, one for the higher parts of the burgh, and another for intercepting the

sewage of low-lying portions. Both reach from different points the filtration beds at Dryfield. The works of Dryfield consist of a storage tank, a distributing and screening tank, and the various channels and conduits connected therewith, and several filtration beds, covering at present an area of nine acres. After passing through the screening tank, the sewage will be directed by a number of sluices into the various distributing channels, and by them carried to the filtering beds. The subsoil drains lead to a main outfall, discharging into the Kelvin. The site of the farm at Kirkintilloch is twenty-four acres, and the population of the burgh is 8,000; but meantime only nine acres of the land have been laid out for cultivation. A large portion of the remaining fifteen acres can be used for purposes of irrigation, and ultimately, as the town increases, will be laid out in the same way as the nine acres.

The President (Dr. Littlejohn) described the manner in which the sewage of Edinburgh was disposed of. He explained that in the northern district, formerly drained into the Water of Leith, the sewage was now bottled up at the western boundary of the city, and conveyed in an iron pipe to the Firth of Forth at a point between Granton and Leith. The central district discharged its drainage on sandy soil on the celebrated Craighentenny meadows. In the southern district they had a population of 35,000 people located in villa residences with all modern improvements. This district drained into the Pow Burn, and it had been found necessary to lay down a pipe to convey the sewage of 40,000 people to the sea. The outfall of this pipe was a little to the west of Portobello, and a portion of the sewage was carried into the Craighentenny meadows. These meadows now extended to 186 acres, but they were insufficient.

Dr. J. Davis, Chicago, said he had listened to the papers which had been read with the greatest interest, for they gave information of which he had been in search for years. He described the system of drainage which had been adopted in Chicago, and stated that a scheme was before the State and the National Legislatures for turning the waters of Lake Michigan to the Ohio, and on through the Illinois river into Mississippi, so that the sewage of the city might be carried to the Gulf of Mexico. He strongly objected to this scheme of sending the sewage half the length of the continent and polluting rivers throughout their entire distance. There was sufficient prairie land within from ten to forty miles of the city on which sewage might be turned.

Colonel Jones described a sewage farm which he took in the year 1872, near Wrexham, 150 acres, and upon it treated

# CHUBB'S DOOR LOCKS

Are the BEST and MOST SECURE,  
and are UNPICKABLE.

## TWO TESTIMONIALS RECEIVED IN ONE DAY.

365 LIVERPOOL ROAD, LONDON: August 9, 1888.

SIRS,—I have much pleasure in testifying to the security of your PATENT LOCK, having had one in use several years. It was attempted to be forced, but not successfully; although the Lock was injured the door was not opened. This I consider entirely due to your SAFETY LOCK.

Faithfully yours, M. H. BOWMAN.

To Messrs. CHUBB & SON, 128 Queen Victoria Street, E.C.

RICHMOND HOUSE, BARNSBURY, N.: August 9, 1888.

DEAR SIR,—I beg to say that an attempt was made to break into my premises on Monday last, but, owing to one of your LOCKS, the thieves could not get in.

Yours truly, W. DAVIS.

Messrs. CHUBB & SON, 128 Queen Victoria Street, E.C.

And at Liverpool, Manchester, Wolverhampton, Melbourne, &c.

the sewage of a population of 12,000 inhabitants. The scheme had been thoroughly successful, the authorities of Chester, who had been carefully watching the experiment, having found no ground for complaint.

Mr. W. R. W. Smith said that irrigation could only be applied in favourable circumstances. Given land suitable for irrigation, there could be no question that the best affluent was secured by that means. But there were many cases in which other methods must be adopted. The Local Government Board, having power to enforce the introduction of clean water into a city, burgh, or village, should have power to force the authorities to take away their dirty water; and if the Association was to come to any resolution it should be to ask the Government to give such powers. Public bodies would do nothing till they were forced. When compulsion was brought to bear on them the thing was done.

Mr. Bateman, Norwich, could not agree with Mr. Smith. The important question was as to how the thing was to be done. In proof of this, he mentioned that the town of Norwich had spent 200,000*l.* on a system of irrigation which had proved a failure. The mistake they made was that they carried their sewers at a low level under the river. They required to spend 3,000*l.* a year in pumping to their irrigation farm, which was on a high level, and they could not keep the water out of their sewers.

The discussion was then brought to a close.

#### OBSTRUCTION OF LIGHT.

AT the Chancery Court of the County Palatine of Lancaster, a case was decided on Tuesday in which the plaintiff, Mr. Martin, a property owner in Pembroke Place, Liverpool, sought for an injunction to restrain the committee of the Liverpool Royal Infirmary from obstructing his ancient lights on the southern and western side of his premises, 100, 102, 104 and 106 Pembroke Place, by the new infirmary buildings in course of erection. The lights of the premises in question, it was stated, had been seriously obstructed, the consequence being that the present tenant of No. 100, Mr. Slade, a cycle manufacturer, whose business required an abundance of good light, had given notice to quit. Mr. Maberly and Mr. Horridge appeared for Mr. Martin, and Mr. Rotch and Mr. Cochran for the Royal Infirmary. Mr. Martin stated in examination that there

was not the slightest foundation for the suggestion that he bought the property and altered it for business purposes with the view of making an undue or improper claim upon the defendants.

The Vice-Chancellor said he did not think any case for an injunction had been made out as regarded the southern window at the house in question, and he therefore dismissed that part of the action. With respect to the western lights he had been impressed by the evidence already given that the light had not been seriously and materially affected, and he suggested that the defendants should concede to build the eastern wall of their block in a sloping manner instead of perpendicularly.

Mr. Rotch argued that nine-tenths of the evidence of the plaintiff was totally irrelevant, because Mr. Slade, whose comfort was alleged to have been affected, was not a party to the action. Simply because Mr. Slade's comfort had been disturbed he could not succeed in the action; he could only succeed by showing material injury to his own reversion in the lease of the property, and there was no evidence that the selling or letting value of the property had been affected.

Mr. J. P. Bradley, architect, stated that the new buildings would not affect the letting or selling value of the plaintiff's premises. Mr. Edmund Kirby, chairman of the Liverpool Architectural Society, gave similar evidence. Mr. John Henderson, dentist, stated that in 1880 he occupied the house, and he then did very fine work in the room the light of which was alleged to be affected—much finer work than that done by Mr. Slade. He was of opinion that the new buildings would not diminish the light to such an extent as to prevent fine work being done there. Other witnesses were called as to the sufficiency of light, a watch manufacturer, Mr. J. C. Blundell, describing the light as ample for the purposes of his business.

In giving judgment, the Vice-Chancellor said he had no doubt about the case. As he had already said, the southern lights of the premises were not interfered with because of the distance of the new buildings from his property and the shape they assumed. As to the western lights, there was only one witness who said that he had suffered any damage by the diminution of light. The whole question of the western lights turned upon No. 100, because the wing of that place precluded the lights of the other houses being interfered with, and the tenant of this place gave notice to quit long after the present proceedings were instituted. On behalf of the defendants a number of gentlemen had been called to state that the property was not monetarily affected by the new buildings, and as the

block was 63 feet from the windows he came to the conclusion that there was no injury to the lights, and that no case had been made out for relief. The action would therefore be dismissed, but he hoped costs would not be pressed against the plaintiff. Mr. Rotch said the Infirmary was a charity, and therefore they could not help pressing for costs.

### CLAY AS A MINERAL.

JUDGMENT was given on Saturday in the appeal to the House of Lords of the Corporation of Glasgow against Mr. Allan Farie, of Farme, Rutherglen, from a decision of the Court of Session in Scotland reversing a judgment of the Lord Ordinary. In 1871 the appellants, under the provisions of the Glasgow Waterworks Act, compulsorily purchased from the respondent a quantity of land, upon which they have subsequently constructed two large reservoirs for the purposes of their waterworks. The price which the appellants paid for the land was 11,000*l.*, and the purchase was made under the general provisions of the Waterworks Act, whereby the property in the coal, slate, and ironstone, and "other minerals" which might be beneath the land purchased should remain in the seller, and that they should not be paid for by the purchasers of the surface soil until the seller should give notice of his intention to work such minerals. Beneath the land so acquired by the appellants there lay a large quantity of clay, and in 1885 the respondent gave the appellants notice of his intention to work the clay as one of the minerals reserved to him under the Act. The appellants thereupon denied that clay was a mineral so reserved, and asserted that the property in it had passed to them when they purchased the surface of the land. Litigation having arisen between the parties in consequence of this dispute, the Lord Ordinary decided in favour of the appellants, but his decision was reversed by the Court of Session. The case was argued some time ago, when judgment was reserved.

Judgment has now been given reversing the decision of the Court below, the Lord Chancellor, Lord Watson, Lord Fitzgerald, Lord Herschell, and Lord MacNaghten being present.

The Lord Chancellor said he was satisfied with the view put forward by Lord Mure in the Court of Session.

Lord Watson said: I am unable to assent to the appellant's argument that in section 18 of the Waterworks Clauses Act, mines must be understood in the same sense which it has been

held to bear in the Statute of Elizabeth. Such may have been its original meaning, but it appears to me to be beyond question that for a very long period that has ceased to be the exclusive meaning, and that the word has been used in ordinary language to signify either the mineral substances which are excavated or mined, or excavations, whether subterranean or not, from which metallic ores and fossil substances are dug out. It does not occur to me that an open excavation of auriferous quartz would be generally described as a gold quarry. I think the people would naturally call it a mine. The whole framing of section 18 indicates, in my opinion, that the Legislature intended it to include minerals got by what has been termed mining proper. The clause excepts mines of slate, and also "other minerals," an expression which must at the least include rock strata of the same homogeneous character, and generally worked, or capable of being worked, by the same methods as slate. To adopt in section 18 and the corresponding railway clauses the same construction of "mines" which has been followed for the purpose of the English poor rate, would, in my opinion, lead to consequences which the Legislature cannot have contemplated. In that case the extent to which minerals in the lands were sold or excepted at the date of the conveyance would depend on the mode underground or opencast by which they might be found at some future and far distant time to be workable, or upon the method according to which the landowner might then choose to work them. These factors being indeterminate it would be well-nigh impossible at the date of the purchase to arrive at a fair estimate of the compensation payable for it. I cannot conceive that the Legislature, in using the expression "mines of slate," meant to distinguish between the different methods of getting it, and to enact that slate which may never be disturbed shall be taken and paid for at once if it would naturally be quarried, but shall not be taken and paid for until it is actually worked if it would naturally be got by means of an underground level. It was certainly within the contemplation of the Legislature that water or railway works may rest upon excepted minerals, because it is expressly provided that the undertakers or the company are to be entitled to such parts of these minerals as require to be excavated for the purpose of constructing their works. When a railway company or water undertaking excavates in order to obtain a foundation for their works there is no roof to the excepted minerals, and it is difficult to understand how in these circumstances they could be got by proper mining. I am

## Wilson's Patent Dioptrical Pavement Lights.

WILSON & CO. beg to call the attention of Architects and others to the superiority of Wilson's Patent Dioptrical Lenses for pavement and floor lights. These Lenses are constructed on strictly scientific principles, and have been approved by some of the highest authorities on Light. They are made of the Best English White Flint Glass of high refractive power, and transmit more light than any other form of Lens yet introduced. The reflecting surface being spherical, the rays of light are distributed in every direction.

Fig. 1 shows how the ordinary prism or semi-prism, by receiving the rays on a plane reflecting surface, throws them forward at one angle only, in parallel lines close to the ceiling.

Fig. 2 represents the Patent Dioptrical Lens, and shows by comparison how the rays of light, striking on the curved inner surface, are reflected forward through the face of the lens in every direction, filling the whole angle of 90°, thus illuminating the apartment from floor to ceiling and from wall to wall.

From the above diagram it will be seen wherein consists the advantages claimed for Wilson's Patent Lenses. The objection to the semi-prism is that it reflects the light, as shown in Fig. 1, at such an angle as to be of little use, and more especially if the line of the ceiling is below the line of the pavement; then the value of the semi-prism as a light projector is entirely lost.

It will be seen also, on reference to the above diagrams, in Fig. 1 that the first row of semi-prisms obstructs the rays of light from each succeeding row, whereas in Fig. 2 the bulk of the rays of light are projected at such angles as to pass unobstructed into the room.

The correctness of these illustrations can be practically demonstrated to any architect desirous of testing them.

PRICE LISTS AND ESTIMATES ON APPLICATION TO

**WILSON & CO., Bridge House, 181 Queen Victoria Street, London, E.C.**

accordingly of opinion that in this enactment the word "mines" must be taken to signify all excavations by which minerals may be legitimately worked and got. If coal, ironstone, or slate crops out at any part of the surface either for waterworks or railway purposes, the undertakers or company acquire, in my opinion, no right save the right to use that part of the surface; they acquire no right to the minerals themselves except in so far as these are dug out or excavated in order to construct their works. But an important question still remains—What are the minerals referred to other than coal, ironstone, or slate? My present impression is that "other minerals" must necessarily include all minerals which can reasonably be said to be *ejusdem generis* with any of those enumerated, slate being one of them. I do not think it would be possible to except freestone or limestone strata. I may add that, so far as I can see, it is possible that there may be some strata which would pass compulsorily to the purchaser if they lay on the surface, but may possibly be reserved to the seller if they occurred at some depth below it. I desire to say that in the view which I take of the present case it is not necessary to determine any of these points. The enactments in question describe the excepted mines of minerals as lying under the land compulsorily acquired, and they appear to me to contemplate that the purchasers, as soon as they obtain the conveyance, shall become the owners "of the land." That expression as it occurs in this enactment obviously refers to surface, and the question therefore arises what in ordinary acceptance is understood by the surface crust of the earth which overlies its mineral strata. It is of course conceded that vegetable mould, which commonly forms a large ingredient of the topmost layer of the crust, is not within the exception, but it is also the fact that in many districts the cultivable mould is mainly composed of clay, which is mineral in this sense that it is an inorganic substance. I have come to the conclusion that the expression "the land" cannot be restricted to vegetable mould or cultivated clay; that it naturally includes, and must be held to include, the upper soil, including the subsoil, whether it be clay, sand, or gravel, and that the exceptional depth of the subsoil, whilst it may enhance the compensation payable at the time, affords no ground for bringing it within the category of excepted minerals. I am accordingly of opinion the interlocutor of the First Division of the Court of Session ought to be reversed, and that of the Lord Ordinary restored.

Lord Herschell said: I have the misfortune to differ from the rest of your lordships who heard the arguments in

this case. I thought for some time that the language used must be construed as applying only to those seams or strata of the specified and other minerals which were capable of being wrought by underground workings. It seems to me that there is much to be said for that view, but after much reflection I do not feel that it affords a safe basis for decision, nor is it clear that it would assist the appellants. It must be remembered that it is part of the scheme of the statute that the undertakers do not purchase any right to the support of the underlying strata of minerals. No one has doubted that if they refuse to purchase the reserved minerals whatever is really within the reservation may be got, even though the result be to cause a serious subsidence and even dislocation of the surface. In this respect the case differs from an ordinary reservation in a deed unaffected by statutory provisions. In such a case the owner of the reserved minerals can only work such portion of them as can be removed without causing disturbance of the surface, or if he removed more he must provide some substituted means of support. Therefore, where it is suggested that the reservation in question embraces only such mineral seams as are capable of being worked underground, that cannot mean such as are capable of being so worked without disturbing the surface. Once this conclusion is arrived at, it is difficult to see any firm basis for a distinction between seams which lie at a considerable depth below the surface, the removal of which would be likely to affect it little, and those which lying near it could not be got without very seriously affecting it. What valid distinction could be drawn between a seam of coal or ironstone a hundred yards beneath the surface and one which came within 2 feet of it? And if the latter would be within the reservation, how can a seam of clay similarly situated be excluded? I have said that it is not clear that the proposed interpretation of the section would be of any advantage to the appellants, for proof not having been led I cannot assume that the clay might not be got otherwise than by surface operations by working on from the adjoining land, though, of course, its removal would cause subsidence and great disintegration of the surface. I own I have entertained very grave doubts as to the proper conclusion to be arrived at, but I do not see my way to differ from the agreement of the Court below. I think the reservation must be taken to extend to all such bodies of mineral substances lying together in seams, beds, or strata as are commonly worked for profit and have a value independent of the surface of the land. I desire to guard myself against being supposed to decide more

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

SIR.—I have much pleasure in testifying to the efficiency of your patent warm-air fire-grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c., JAMES WEIR, F.R.S.B.A., 6 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect, 28 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out his plan of warming in several churches built under my direction, and in each case it answers remarkably well, and has given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E., September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery, Derry, September 18, 1887.

DEAR SIR.—I cannot refuse to give you a few words of commendation as to the apparatus you supplied for heating Derry Cathedral. Not only is the air of the Cathedral quite pure and pleasant to those attending the services, as it must be from the fact that most of the air heated is taken from the outside, but I find the building itself is so much benefited, as formerly it was damp and smelt damp, but now it is very dry and free from any musty smell. I find that, although the Cathedral is now much larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington, Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

Mr. John Grundy.

than I do. The pursuers in this action seek to interdict the defender altogether from working the clay under their land in any manner whatsoever. All that, in my opinion, arises for decision is whether they are entitled to do so. I say this because it was contended before us that inasmuch as the statute authorises the use of such part of the minerals as may be necessary for the pursuers' works—and the bed of clay forms the bottom and sides of their reservoir—the defender cannot be entitled to take away this clay. But the point, which is well worthy of consideration, does not appear to me to be raised at the present time. I therefore forbear from expressing any opinion upon it, or (assuming it to be well founded) upon the further question how much of the clay can be considered as their own for the purpose of the waterworks, and therefore as having become the property of the appellants. I think the interlocutor appealed from must be affirmed.

Lord MacNaghten, who concurred with the Lord Chancellor and Lord Watson, said he desired to base his judgment on what seemed to him to be the plain meaning of the words of the Act, but at the same time it was satisfactory to find that the result was consistent with what might be presumed to have been the intention of Parliament, and not likely to lead to inconvenient consequences. He was of opinion that the interlocutor under appeal should be reversed.

Their lordships accordingly by a majority reversed the interlocutor of the First Division of the Court of Session, and restored that of the Lord Ordinary.

#### PLUMBING REGULATIONS IN NEW YORK.

NEW specifications drawn up for the Board of Health for plumbing in the city of New York took effect in July as follows:—

The plumber will furnish all materials and perform all labour requisite and necessary for putting up and completing all the plumbing-work in a good and thoroughly workmanlike manner, according to the plans therefor as approved by the Board of Health. All materials will be of good quality and free from defects.

The ..... will properly close all openings in floors and ceilings about lines of drain and vent-pipe, so as to prevent the passage of foul odours from one floor to another along said lines of pipe.

The plumber will send notice to the Board of Health when the work will begin, and also at various times during the progress of said work before any part of it is permanently covered.

The plumber will properly protect all pipes and fixtures as soon as set, and close all pipe openings so as to prevent obstruction and damage.

The ..... will do all the excavating and refilling required for the proper carrying out of these specifications, except as such work is herein otherwise specifically provided for.

The plumber will obtain and pay for all necessary permits, and comply with all corporation laws relating to the subject matter of these specifications.

After the completion of the work under these plans and specifications, and before its final acceptance, the plumber must obtain the certificate of the Board of Health that there is no violation of law on record against said work, and also a water permit from the Department of Public Works. He will then turn on the water, and leave everything in perfect working order.

#### I.—MATERIALS, &C.

**Earthenware Pipe.**—All earthenware pipe herein specified must be hard, smooth, salt-glazed, and cylindrical, and not less than three-quarters of an inch in thickness. Each length will be perfectly straight and free from any fire cracks, flaws, blisters, or other defects. All special fittings to be of the same quality as the pipe.

**Cast-Iron Pipe.**—All cast-iron pipe and fittings must be sound, cylindrical, and smooth, free from cracks, sand-holes, and other defects, of a uniform thickness, and of the grade known in commerce as extra heavy. All iron pipe will be firmly secured in position by ... placed not less than ... feet apart. No tar-coated pipe will be used, but after the pipes have been tested and accepted by the inspector they will be coated with ..... The following average weights per lineal foot will be accepted:—2 inches, 5½ lbs. per lineal foot; 3 inches, 9½ lbs.; 4 inches, 13 lbs.; 5 inches, 17 lbs.; 6 inches, 20 lbs.; 7 inches, 27 lbs.; 8 inches, 33½ lbs.; 10 inches, 45 lbs.; 12 inches, 54 lbs. All joints in cast-iron pipe will be made with picked oakum and molten lead, and the plumber will make the joints impermeable to gases by bedding the lead with hammer and calking iron. For each joint in cast-iron pipe twelve ounces of lead must be used to each inch of diameter of the pipe in which the joint is made. No putty or cement joints will be permitted. The lead used for calking will be

# KALLKOLITH.

## NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN  
England,  
Belgium,  
France,  
Germany,  
Italy.

TRADE MARK.

PATENTED IN  
Austria-  
Hungary,  
Denmark,  
United  
States  
of America.

**KALLKOLITH** is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

**CHEAPNESS.**—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

**ECONOMY** is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

**DRYING POWERS.**—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

**DURABILITY.**—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

**PAPER-HANGING.**—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

#### TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.  
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of coats now given reduced, and, once fairly introduced in the market, I am certain there will be a large sale.  
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.  
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.  
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—**KALLKOLITH CO., 175 STRAND, LONDON, W.C.**

pure, soft pig lead; no old joints or other defective material will be used.

*Wrought-Iron Pipe.*.....

*Lead Pipe.*—All lead soil, waste, and vent pipe will be drawn pipe of the best quality, and of the following weights per lineal foot..... All connections of lead with iron pipes will be made by brass ferrules of the same size as the lead pipe, set in the hub of the branch of the iron pipe and calked in with lead, the lead pipe to be attached to the ferrule by a proper solder-wiped joint when practicable. No putty or cement joints will be permitted. All connections of lead soil, waste and vent pipes will be made by wiped joints. All lead pipes will be firmly secured in place with hard metal tacks and screws, placed not less than ... feet apart; and all horizontal lead pipes will be well supported for their whole length by shelves or carrying strips, to be provided and put up by .....

II.—TESTS.

The plumber will test all of the soil, waste, drain and vent pipes herein described, in the presence of a plumbing inspector, and, after due notice to the Board of Health, by a pressure test, the pressure to be applied as directed by the inspector, and after all openings in the pipes have been securely closed by the master plumber or other person in charge of the work. None of said pipes shall be covered until after they have stood the test to the satisfaction of the inspector.

III.—CESSPOOLS AND SEWERS.

The ..... will construct in ..... at ..... feet from the building, a cesspool ... by ... and ... deep, with ... inch ... walls, and bottom made absolutely watertight by means of ..... The cesspool will be covered with ..... and ventilated by ..... No privy vaults or cesspools for sewage will be permitted where connection can be made with a public sewer.

*Private Sewers.*—Where there is no public sewer in the street, and it is necessary to construct a private sewer to connect with a public sewer in an adjacent street or avenue, it must be laid outside the curb under the roadway of the street on which the houses front, and not through the yards or under the houses. Such sewer will be constructed in the following manner:—

*House Sewers.—Excavation.*—The ..... will make the necessary excavations for the house sewer from the .... wall to the ... sewer in ....., making a smooth bottom for each

pipe, free from all projections of rock, and with the soil well rammed to prevent settling of the pipe.

*House Sewer—Earthenware.*—[NOTE.—The laying of earthenware drain-pipe for house sewers, in made or filled-in ground, is prohibited by the rules established by the Board of Health. But where the soil consists of a natural bed of loam, sand, or rock, it is permitted to be laid outside the cellar, vault, or area wall to the street sewer, if laid in strict compliance with the following directions.] The ..... will make a separate connection for each building with the ..... sewer by an earthenware pipe, ... inches in diameter, hard and salt-glazed, and ... of an inch thick, run at a uniform grade of not less than  $\frac{1}{4}$ -inch per foot, extending the same to a point not less than 2 feet outside of the outer face of the front cellar, vault, or area wall, as the case may be. Every section will be bedded in cement at the hub. The ends of the pipe will be wetted before applying the cement, and the space between each hub and the small end of the next section will be completely and uniformly filled with the best quality of hydraulic cement, care being taken to prevent any cement being forced into the drain to become an obstruction. No tempered up cement will be used. A straight edge will be used, and the different pipe sections laid in perfect line on the bottom and sides.

*House Sewer—of Iron.*—Or the plumber will make a separate connection for each building with ..... sewer in ..... by ..... inch extra heavy cast-iron pipe, run at a uniform grade of not less than  $\frac{1}{4}$ -inch per foot, to a point just inside of the ... cellar or vault wall, as the case may be. The house sewer, in each case, will be connected to the street sewer at a point directly in front of the house for which it is laid. Old sewers or house-drains can be used for new buildings only when found by a plumbing inspector to conform in all respects to the regulations governing new sewers and drains. They will in each case be uncovered for examination by the ..... Notice will be sent to the Health Department when any sewer or drain-pipe herein specified is ready for inspection, and it can be covered only after it has been examined and pronounced satisfactory by an inspector from the Board of Health. In filling the trench no stones will be placed in contact with the pipe, and the earth will be thoroughly packed in without moving the pipe in the slightest degree, or starting any of the joints.

IV.—HOUSE-DRAIN.

The plumber will make a proper connection with the house-sewer by extra heavy cast-iron pipe, and set a ... inch extra

heavy cast-iron running, or half-S trap just inside of the front wall, with a handhole for cleaning, covered with a screw-cap, properly fitted. A fresh-air inlet of extra heavy cast-iron pipe, not less than 4 inches in diameter, will be provided and properly connected with the house-drain on the inlet side of the house-trap, and extended up flush with the sidewalk near the street curb, and properly covered by a galvanised iron grating leaded into the flagstone; or extended to ..... not less than ..... feet from any door or window, and opening at least 12 inches above finished grade, with cap, bend or grating. The ..... will build a ..... box or manhole with ... cover about the drain-trap, so as to make it readily accessible. The plumber will continue the house-drain of extra heavy cast-iron pipe ... inches in diameter, along the cellar wall or ceiling from trap to the point shown on the plan, giving it a uniform grade to the trap of not less than  $\frac{1}{4}$  inch per foot. The house-drain must not be laid beneath the cellar floor, unless the location of fixtures in the cellar or basement, or the drainage of yards, cellars or areas requires it to be so laid. Make necessary changes in direction by curved pipes, and all connections by Y branch pipes and one-eighth or one-sixteenth bends. From the points shown on the plan, branch pipes of extra heavy cast-iron, to be connected with the drain-pipe to receive the soil and waste-pipe, the rain-water leader and the connections from the area, cellar, and yard drains. All of said branch-pipes to be of the diameter hereinafter described and as shown on accompanying plan of cellar drainage. Where handholes for cleaning are provided on the house-drain or its branches or on the house-drain trap, proper ferrules with screw covers will be used and made gas-tight.

#### V.—SURFACE DRAINAGE, &C.

All yards, cellars, areas and light courts will be properly graded by the owner and drained as hereinafter specified. The traps for all such drains will be placed inside the cellar wall and made accessible. Cellars will not be connected with the house-drain unless absolutely necessary, dry cesspools being used where practicable. If connected to the house-drain, running taps with cut-off valves and proper water-supply will be provided for each connection, as follows:—The ..... will build in each yard, cellar, area, and light court, where shown on plans, a brick cesspool or catch basin, ..... by ..... by ..... made watertight if sewer-connected, and the plumber will set over each a ..... strainer, and make connections therewith as specified. Provide and set where shown on plans ... inch

extra heavy cast-iron yard drain, connecting with the house drain, and trapped by ... inch running trap. Provide and set where shown on plans ... inch area and light court drains connecting with the house-drain, and trapped by ... inch running trap. If found necessary to prevent dampness, the owner will make the cellar and foundation walls impervious thereto by means of asphaltum or coal-tar pitch and cement. Subsoil drains will be provided only where necessary. Their construction, trapping, and special provision for maintaining their trap will be as follows :..... stable drains.....

(To be continued.)

11290. Edward Young, for "Improvements in roofing tiles for the purposes of utility and ornament." August 4, 1888.

11296. John Ward, for "Improvements in fire-lighters." August 4, 1888.

11305. Henry Harmston, for "Improvements in loose block letters or numbers, and in the method of affixing the same to doors or any part of a building, or to any article as required." August 4, 1888.

11306. William George Howard, for "An improvement in window-fasteners." August 4, 1888.

11335. Richard Hawkes, for "Improvements in apparatus for flushing water-closets and urinals, and for other like purposes." August 4, 1888.

11362. Arthur Ostins, for "Self-closing window." August 7, 1888.

11364. James Matthew Matthews, for "Improvements for appliances for raising or lowering the glass frames of railway and other carriage-doors, and for other purposes, and for retaining or holding same in any desired position." August 7, 1888.

11372. Thomas William Aylesbury and James William Russell Wall, for "Improvements in service and cistern cocks for automatically preventing the waste of water." August 7, 1888.

11385. John Elton, for "Improvements in the manufacture of pencils." August 7, 1888.

11398. Peter Brentini, for "An improved compound for removing paint from painted surfaces." August 7, 1888.

11427. John Bell Millar, for "The construction underground of public urinals, water-closets, and lavatories for large cities and crowded thoroughfares." August 8, 1888.

11428. John Bell Millar, for "A special improvement in the discharge and overflow arrangements of baths manufactured of cast-iron." August 8, 1888.

11429. Joseph Parkinson, Charles Frederick Parkinson and Samuel Fawcett, for "An improvement in rules, T-squares, levels, and set squares, to enable them to be accurately set for indicating angles." August 8, 1888.

11446. Mary Elizabeth Sugden, for "Improvements in attaching and supporting window-curtains or short blinds." August 8, 1888.

11466. Charles Southon the younger, for "A metal cowl to prevent down-draughts and cause the air or smoke to ascend in chimneys, &c." August 8, 1888.

11477. John Horton, for "Leaded window-blind catch and fastener." August 9, 1888.

11483. George Henry Planner, for "A disinfecting apparatus for water-closets." August 9, 1888.

11502. Léon Elfege Portelance, for "Improvements in locks or fastenings." August 9, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

8307. Albert Barraclough, for "Improvements in metal pipes for hot-water apparatus and other purposes." June 7, 1888.

8376. Charles Edward Shepherd, for "Improvements in apparatus for determining the range of distant objects from a given point, also applicable as a surveying instrument to delineate inaccessible or accessible ground." June 8, 1888.

8829. John Fraser Calder, for "Improvements in cisterns for water supply to water-closets and other appliances." June 16, 1888.

8894. Joseph Bennett, for "Improvements in connection with pipes or channels for conveying gas." June 18, 1888.

9100. Robert Nelson, for "An improved blower for domestic and office fireplaces." June 21, 1888.

9181. William Köllmann and John Ferdinand Kayser, for "Holder for the cords of Venetian or other blinds, pulley blocks, and the like." June 23, 1888.

9780. "Improvements in racks applicable for holding the operating cords of window-blinds." July 5, 1888.

10066. Charles Darrah, for "Improvements in ventilators." July 11, 1888.

10081. Alfred Julian Boulton, for "Improvements in or relating to the application of paints or colours in imitation of wood graining." July 11, 1888.

10147. William Lucas and Thomas Alexander Garrett, for "Improvements in maps to facilitate the measurement of distances on them." July 12, 1888.

10459. William Harte, for "Improvements in fastenings for windows." July 19, 1888.

10532. Franz Genth, for "Improvements in water-closets." July 20, 1888.

10554. Frederick Sawyer Winsor, for "Improvements in flushing tanks or cisterns." July 20, 1888.

10654. Walter Russell Mortimer and James Holloway, for "Improvements in electric arc lamps." July 23, 1888.

10881. James Chandler, for "Improvements in the construction of locks." July 27, 1888.

## HARPER TWELVETREES' New System of Washing Machinery

For PUBLIC INSTITUTIONS, HOTELS, SCHOOLS, & MANSIONS,  
As used in Her Majesty's Laundry, Devonport Steam Laundry, Rangoon Steam Laundry, Suez Steam Laundry, Whitechapel Infirmary, Mont Dore Hotel (Bournemouth), &c., &c.  
Is specially recommended to Architects as the most perfect and economical.

Plans and Specifications for completely furnishing Hand or Steam Laundries given to Architects and Engineers; together with Prospectus of Washing, Rinsing, Boiling, Wringing, Drying and Iron Machines, Hydro-Extractors, Drying Closets, Stoves, Engines, Boilers, and all Laundry requisites.

**STEAM LAUNDRY ENGINEER,**

7 John Dalton Street, MANCHESTER.

**BLOCKS IMMOVABLE,**  
Being "Keyed" to Substructure by  
**METAL KEYS,**  
And by an  
Adhesive & Preservative Mastic  
Speciality: OAK AND DARKENED OAK.

### PARQUET FLOORINGS.

150,000 ft. super. in Stock, ready for Laying,  
**RIGA INCH OAK FLOOR BOARDS,**  
Tongued and Grooved, **VERY CHEAP.**  
Immense Stock always ready for Laying.

### THIN PARQUET

(Turpin's Patent). 5-16 inch thick, prepared on deal back laminations, equal in wear to inch Solid Parquet. Used for Veneering old existing deal floor, and is susceptible of removal at pleasure. See Construction.

### ARTISTIC JOINERY.

### WOOD CARVINGS.

All Styles executed for the Trade at Special Rates. Skilled Artisans sent to all parts of the country.  
Estimates and Designs on Application.

**ORNAMENTAL PARQUET.**  
**DEAL BACKING.**

**TURPIN'S**  
PARQUET FLOOR,  
JOINERY and WOOD  
CARVING CO., LD.,  
22 QUEEN'S ROAD,  
Bayswater, London, W.

## COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

11237. Harry Noble and Geo. Haley, for "Improvements in the hearths of fireplaces, fenders, and dados, of metal and enamel." August 17, 1887.

11997. Henry Thwaites, for "A gravity pleasure railway." September 5, 1887.

13516. William Philip Willmot and Charles Jarrett, for "Improvements in and connected with desk or other flaps and seats." October 5, 1887.

13537. Thomas Constantine Fawcett, for "Improvements in brickmaking and brick-drying machinery." October 6, 1887.

13588. Lizzie Anna Walker, for "Improvements in or relating to the extinguishing of fire in theatres, mills, and other structures." October 7, 1887.

13680. James Season, for "Improvements in the construction of roofs." October 10, 1887.

17632. Hermann Muller, for "Improvements in and relating to roller shutters and blinds." December 22, 1887.

4518. John Henry Marston, for "Apparatus for opening and closing fanlights, skylights, or casements." March 24, 1888.

## PATENTS SEALED, AUGUST 10, 1888.

8761. Stuart Caradoc Munro, for "Improvements in locks and in keys for the same." June 17, 1887.

9421. Antonia Luiga Mora, for "Improvements in or connected with stops or guards applicable for use with carving-forks, or for securing doors or windows, or for other like purposes." July 2, 1887.

10562. Worthy Sargent, for "An improved water-waste preventer, for giving a flush and after-flush." July 30, 1888.

12168. Gustav Bay, for "A new or improved process for obtaining positive black lines, copies from positive tracings or negatives, by the action of light." September 8, 1887.

2152. Francis Obre Ferguson, for "Improvements in and connected with pencil-cases and drawing instruments." February 13, 1887.

2218. Joshua Stevens, for "Improvements in compasses, callipers, and analogous instruments." February 14, 1887.

## NOTES ON SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in and relating to fastenings to the doors of theatres, halls, and the like." No. 12603. 1887. William Baird, 43 Douglas Street, Glasgow. An invention for automatically unbolting doors by means of the pressure of a crowd, which, pushing against the doors, act as levers attached thereto, and which release the bolts which hold the doors. The bolts are arranged by means of cranks to shoot both top and bottom simultaneously.

*Claim 1.*—The combination of parts constituting the improved means for fastening and automatically unlocking the doors of theatres and the like, substantially as set forth.

"Improvements in the construction of street gullies." No. 13877. 1887. William Bird, 5 Armley Hall, Oak Road, New Wortley, Leeds. The object of this invention is to provide for the easy ventilation or non-ventilation of street gullies, without disturbing pavement, &c., or interfering with the cleansing of such gullies.

*Claim.*—Gullies with a partition B and ventilating opening E, substantially as and for the purposes shown and described.

"An improved appliance for preventing down-draughts in chimneys and flues." No. 7957. 1888. J. B. Tonge, 27 Salt-house Road, Barrow-in-Furness. This appears an ingenious invention for the prevention of down-draughts, and consists of a frame built into the flue, having an opening at opposite sides of the same. To these openings are hinged flaps, one above the other, each at about an angle of 45 deg. The down-draught is caught on these, and forced out through openings, and any draught passing the upper flap is caught upon the second one, and thus a complete prevention of down-draught is obtained.

*Claim.*—The advantage of a sliding frame filling whole space of flue with dual system of flaps, rendering the downpour of smoke beyond the frame virtually impossible. Cheapness of production and easy of insertion. The curvature of the outer edges of the flaps obviating the difficulty of sweeping past the flaps, by affording easy access and withdrawal of machine. The method of fixing the frame into the flue.

TO INVENTORS. — Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

## A PEAL OF 8 BELLS FOR £75,

FIXED COMPLETE, READY FOR RINGING.

HARRINGTON'S  
PATENT

## TUBE CHIMES,

EQUAL IN TONE

THE FINEST CATHEDRAL BELLS.

"The music of many tuneful bells, harmonious, ever changing, lending themselves to any simple air, easy of management, and mel-  
lowed as the sound of Cathedral bells. . . .  
Such music I have heard at Coventry."

CASTINGS.

MANUFACTURED FOR THE TRADE ONLY.

# The Architect.

## THE WEEK.

MR. GLADSTONE is no great connoisseur in pottery, if we may judge by his collection when it was seen at CHRISTIE'S, but he has aided in obtaining recognition for the merits of JOSIAH WEDGWOOD. Mr. GLADSTONE has not toned down his enthusiasm for the potter, and is not more precise in his praises than formerly. On Monday, in addressing a large body of men from the Pottery districts, he said that "WEDGWOOD was the greatest man who ever, in any age, or in any country, applied himself to the important work of uniting art with industrial development." The evidence for the statement or against it could not be brought forward unless in the compass of a goodly volume, and Mr. GLADSTONE is, therefore, safe in what he says. But when he talks of the union of art and industrialism by WEDGWOOD, does Mr. GLADSTONE mean English art? If so he is in error, for, considering the extent of his productions, no man could do less for English art than JOSIAH WEDGWOOD. Orators and writers who are ignorant of the subject work themselves into an ecstasy over the connection between WEDGWOOD and FLAXMAN. The truth is that the sculptor in those days was a poor man, and he was paid only a few shillings for a design. The designer of the Etruria Works was not FLAXMAN but WEDGWOOD. The potter could not draw but he could select, and he preferred HAMILTON'S "Vases" to his whole staff of designers. It was from that work he derived his inspiration, and, to say the least, it is absurd of a man like Mr. GLADSTONE to talk about the vases and cameos of WEDGWOOD as if they were the creations of a man "not taught by any former tradition." The fact is, WEDGWOOD'S work is all tradition, and we defy any one to point out either a contour or a scrap of decoration that can be traced to him. We are ready to acknowledge WEDGWOOD'S taste, his organising power, his readiness to sacrifice time and money in order to produce satisfactory work, his rigid supervision and suppression of defective pieces, but he was not an artist or a promoter of English art, and, indeed, with his way of doing business, artists are hardly necessary. They were employed by him only when he failed to possess an engraving that could be copied.

THE sale of Devizes Castle and the adjoining estate by Messrs. DEBENHAM, TEWSON, FARMER & BRIDGEWATER for the insignificant sum of 8,000*l.* may incite Americans to become possessors of historic places. Apparently antiquity is not much appreciated in England. The history of Devizes Castle is most interesting. As far back as 1107 a building was erected on the site. For centuries the castle belonged to English queens; but, like so many others, Devizes Castle never recovered from the injuries it sustained in a defence against CROMWELL'S Ironsides. A new building in the style of the ancient castle was erected on the site, and the late Mr. VALENTINE BAKER and his father must have expended over 80,000*l.* upon the residence. But although there was property independent of the castle and grounds which could be estimated at 270*l.* a year, the estate only realised the sum of 8,000*l.* At thirty years' purchase the extra property was worth that sum, and the costly castle with the grounds was therefore thrown in as valueless. In all their experience the auctioneers can hardly, we imagine, record a more remarkable sacrifice.

ARCHITECTS and builders, when they go holiday-making at this season, sometimes complain of the difficulty of emancipating their thoughts from business. In many cases it is an impossibility, and wise physicians often recommend that a part of every week (say a few hours or so a day) of the holiday should be definitely assigned to work. In the *Lancet* there is a note of a very ancient case, which suggests that it is not always an advantage to be entirely free from all thoughts of the toil which has to occupy a man during the greater part of the year. In other respects the note will be interesting as a scrap of the history of building, which suggests that in the second century the builder was not the

architect. It is as follows:—"Inhibitory paresis," says the *Lancet*, "may be induced by an infinity of causes—by cessation of mechanical work, change of locality, or both these conditions combined. This was noticed by the physicians of antiquity—by none more pointedly than by ARETÆUS, whose 'floruit' is placed by scholars about A.D. 150. In the chapter *περὶ μανίης* of his singularly thoughtful and well-written treatise he adduces the following instance. A house-constructor, as long as he was at work on the premises, proved himself a skilled artisan, capable of measuring, cutting, planing, joining, adapting, and finishing off correctly the woodwork of the house he was engaged upon; he would mix familiarly with the journeymen he hired (*ἐργοδότῃσι*), bargain with them, and pay them a just wage for their work. In this way, so long as he was on the scene of operations, he was in full possession of his faculties. But if he happened to go to the market-square, to the bathing establishment, or to any other place where necessity called him, he would no sooner have laid down his tools than he would begin to groan, then shrug his shoulders as he sallied forth, till he had got out of sight of his familiars and of the work and place he was employed at, whereupon he became a perfect madman (*πάντα ἐξεμάλινετο*). But he had only to come quickly back to the scene he had left, and at once he was in his right mind. Such, says ARETÆUS, was the association in his case between locality and reason."

ARRANGEMENTS have been made to exhibit the collection of architectural models and casts, panels, &c., collected by the late Mr. THOMAS LIDSTONE, diocesan surveyor of Dartmouth, at the Gymnasium, Dartmouth, by Mr. J. PARNELL LIDSTONE, son of the deceased, and Mr. ROBERT CRAFT, of the Library, Dartmouth. Many will be interested in seeing this collection, and persons who are desirous to avail themselves of the opportunity will be welcome. Tickets can be obtained of either of the above-named gentlemen.

THE Black and White Exhibition, which opens in Paris on October 1, will be held in the building in the Champs Elysées known as the Pavillon of the city of Paris, which is assigned for exhibitions of societies that do not possess special buildings. As the Black and White Exhibitions have successfully got through the years of infancy, the committee intend to be more exacting this year as to the quality of the drawings. A new feature will be the industrial designs. As all Frenchmen have a devotion for newspapers much interest will be taken in the spaces allotted to the illustrated journals, in which original drawings as well as reproductions will be seen. All works intended for exhibition must be sent in before September 10.

THE French Minister of Commerce has ordered a competition to be opened for a design for the diploma which is to be awarded to the successful exhibitors in next year's International Exhibition at Paris. The jury is made up of experts about whose judgment there can be no question. Among the members are MM. ALPHAND and BERGER, vice-presidents; MM. CHARLES GARNIER and PAUL SÉDILLE, the architects; M. GALLAND, the decorator; M. DELAUNAY, the painter; M. GUILLAUME, the sculptor; and MM. CHAPLAIN and ROTY, the engravers. There will be only a single prize awarded, viz., ten thousand francs to the author of the design which is recommended for adoption. It is to be hoped that the design will be engraved instead of being reproduced by one of the cheap processes.

THE decision of the jury of the Munich Exhibition has excited some surprise in Paris. M. BENJAMIN CONSTANT, who is one of the leading painters of the modern French school, has been awarded no more than a second-class medal. The reason probably is that he is a magnificent colourist, and his judges were colour-blind. M. COLLIN and M. BAUDE are placed in the same rank. The highest honours are awarded to M. FREMIET and M. COURTOIS, but they are not likely to attach much importance to their first-class medals, and will probably decline to accept them. Just now it is not profitable for a French artist to be esteemed by the Germans.

## THE PSYCHOLOGICAL BASIS OF FINE ART.\*

WHEN Dr. MARIGOLD said that from the Cheap Jack's point of view there was nothing more inspiring towards eloquence than a gun and a pair of spectacles, he was not only imparting information of a special kind, but he was revealing one of the secrets of the power of his creator, and, indeed, of all writers and artists in these latter days. Nobody knew better than CHARLES DICKENS when he wrote about the things which captivate the crowd if they are glorified properly from the Cheap Jack's cart, and that certain ways of making sentences have power over people, and will make them laugh or cry, be pitiful or angry—that is, if the subjects are rightly chosen. He had his own guns and spectacles, which never failed him, no matter how often they were introduced. A similar relation between cause and effect is to be seen wherever people are to be moved. Is there a comedian who has not his peculiar ways of forcing our laugh? Is there a painter who has made his mark without presenting to us repetitions of forms which to us are as welcome as the witticisms about the gun and the spectacles to the rustics in the market-place? Is there a successful designer of ornament having a claim to originality who is not always imitating himself? When the style of an architect is at any time popular, what is it but skill which makes some quality especially pleasing? in one case muscularity, in another finesse; here we admire the ornament, there the daring which is seen in a plain wall. It might be said that in literature and art what people are most glad to patronise is mannerism. It may take the form of CARLYLE's denunciations of talk, in language unlike any spoken on earth; or Mr. IRVING's elocution and gesture, which are no less remote from common life than CARLYLE's amorphous sentences; or Lord TENNYSON's verses, which have as little sustaining power as treble refined flour; or Sir J. E. MILLAIS's pictures of little girls; or Mr. NORMAN SHAW's dainty details, through which a square box would cease to be commonplace: the mannerism is not only the guinea stamp, but the gold also.

In many cases it is difficult to say whether the mannerism is not imposed by the patrons. Among actors it is not uncommon to meet with men who are as discontented with their success as LISTON himself. The public compelled them to take one line. MACREADY, who was more gifted than either KEAN or KEMBLE, never met with the recognition he merited because he would not persist in playing characters of the "Rob Roy" and "Virginius" types. His failure gave rise to the dissatisfaction seen in every page of his diaries. M. COQUELIN is unquestionably the first comedian on the French stage, but amateurs will not give him credit for power to create an original part, or to represent a man resembling the majority of those who are listening to him. Hence the pains he takes to assert himself by seizing on parts like "Brichandau" or "Un Parisien," for which he has not the physical qualifications. In painting and sculpture the power of outsiders is no less apparent. Hereafter Mr. Hook's ancient Venetian scenes will probably be most admired, but he is practically restricted now to the production of pictures made up of a patch of extremely blue sea, rocks of one kind in the foreground, and children of a peculiarly strong colour. The number of the figures in one of Sir J. E. MILLAIS's pictures would seem to be defined for him; Mr. MARKS must persist in painting old men—the drier the better; Mr. ORCHARDSON cannot henceforth venture to bring his figures together; patrons and dealers would be aghast if the President attempted a scene from English life.

The strength of opinion in modifying a man's power may be more forcibly seen in considering the fate of some foreign artists in England. M. FANTIN believes himself to be a flower painter; we are better judges here, and accordingly he is patronised as a portraitist. In France the late GUSTAVE DORÉ appeared to be a painter of small pictures; he succeeded in London by painting colossal representations of scenes from Scripture. If he cared for English patronage, M. BONNAT would probably discover that his forte was not in portraiture but in landscape. But

erroneous opinions are not peculiar to the English. The history of modern art in France presents many instances of artists who were compelled to keep in grooves at the dictation of the public, and of artists who failed because grooves were not discovered for them by the respectable people who assume the guardianship of art. It is as if a command were given by which Dr. MARIGOLD was always to discourse upon his guns and spectacles, and to sell the remainder of his stock on the sly and without public applause.

Any attempt to lay a psychological basis of art at the present day must take into account the relations between the artist and the people who profess to admire his work. To a great extent there is artificiality in the relationship, and accordingly the basis must appear to be on shifting sand rather than on solid rock. We do not therefore object to Mr. GRANGER's attempt to lay a foundation because we are not assured of the stability of what he does, since, under the conditions of the case, we doubt if ARISTOTLE himself (and for such a task he was worth a hundred PLATOS) could be successful. There are so many contingencies, that to lay a psychological basis of fine art seems as hopeless as to plant a lighthouse on the Goodwin Sands. Both works would bring advantages to us, and with our present knowledge both are impracticable.

In attempts of the kind it is, we believe, much wiser to begin with the artist, and to consider his psychology as such, than with what are known as "fine arts," and which have more or less indefiniteness. Mr. GRANGER, however, prefers the latter course, and he adopts the saying of LESSING, which is only second-hand, that "the object of the fine arts is to give pleasure." We suppose what is meant is pleasure to other people besides the artist. It is also taken for granted that the pleasure can be increased when it is taken in common, and no further proof is needed of the late King of BAVARIA's madness than to say that he had an opera performed for his special pleasure. Now experience does not warrant the belief of any universal law about the degree of pleasure being proportional to the number who participate in it. One of the discomforts of theatres and concert-halls is derived from the pleasure of some people who express their emotions at an inopportune time. The French, who know most about pleasures, and who delight in crowds, have taken the precaution to avoid disturbance by getting people to do the applause for them, and if Mr. GRANGER spent a night among the *claque*, he would, we are confident, cease to believe that impressions felt in common can "form a bond of sympathy." But taking that view arises, we imagine, because Mr. GRANGER depends upon what is said in books on psychology rather than upon his own experience. Now the man who is analysed in such books as those on political economy is a sort of algebraic being. Nobody ever met a man of the kind, and he can be endowed with as many or as few qualities as we desire. The artist of psychology is, therefore, a highly endowed being who can be made to aid morality or the reverse, according to the intention of the writer. Mr. GRANGER tries sometimes to steer a middle course, as in saying, "When a painter puts a miser on canvas, his object, so far as he has any beyond the pleasures of sight, is not to strengthen avarice, but to show it in a bad light." Why should a painter trouble himself about attempting to weaken avarice? It is not his business to set up as a moralist, and moreover, he would find economists and others who would tell him that the world owes much to avaricious men. The artist may set avarice in any light he pleases, if he will produce a good picture. The paintings which show things in a bad light are rarely esteemed after a little time. One HOGARTH can serve for centuries.

Although Mr. GRANGER takes so much pains to lay his psychological basis, he acknowledges that an artist can stand on something else. There is an absurd character in one of Mr. BLACK's novels, who is supposed to be a painter, and spends his leisure in reading abstruse volumes of German metaphysics; but we doubt if Sir FREDERICK LEIGHTON would acknowledge if he drew inspiration in that way. Mr. GRANGER is right when he says that "habit, not inference, is the best guide in life; no one, therefore, must expect that any collection of rules will make an artist," and that "the artist must be equipped with habits not rules." Indeed, it may be said that few men who have attempted

\* Notes on the Psychological Basis of Fine Art. By Frank Stephen Granger, M.A., A.R.I.B.A. Nottingham: James Bell.

to add cubits to their stature as artists by the exercise of composing essays on their art, have ever succeeded. They become over-fastidious, or think more of the mental process than of its realisation. Another good point in the book is that archæological lore is not over-prized. "Every departure from familiar usage," says Mr. GRANGER, "sacrifices a certain amount of suggestiveness, and unless this is compensated by the pleasures of novelty, of brilliant colouring, of romance, correctness of historical detail is a mistake from an artistic point of view. It may, however, in certain cases be demanded in order that incongruous associations shall not arise. It is surprising, however, with how little of this truthfulness the mind is satisfied."

In the same way the admirer of a picture need not trouble himself about the psychological basis of his admiration. We cannot suppose that the Athenians who first beheld the Parthenon and its sculpture were able to give an analysis of their feelings that would satisfy modern examiners in psychology; and on the other hand we may suppose that the examiner would hardly know what to think of the combined work of the architect and sculptor. In the nature of things the existence of an artist was contemplated, and those who are not capable to admire his works will hardly be taught by psychology. Mr. GRANGER has given a *résumé* of what is thought about the theory of art by one class of writers, and we hope his formulating of so many difficult thoughts will benefit him in his architectural studies. But that effect will be not only satisfactory, but novel. Psychology has not yet achieved victories by making better artists.

#### PERMANENCY OF WATER-COLOURS.

MR. J. C. ROBINSON writes as follows:—The ultimate results of the discussion on light and water-colours, as embodied in the recently issued Government Blue-book, are so interesting and important that it seems desirable they should not be passed over without further elucidation. As the movement was initiated by myself, and as I have had to bear not a little odium and misrepresentation in consequence, I think I may properly ask you to kindly allow me space for brief comment on certain points in the document just issued. There is now obviously no need for further controversy in the matter, for the experiments made at South Kensington have, I apprehend, conclusively settled the issues raised in the *Times*.

These experiments, at all events, have shown that water-colour drawings, as heretofore executed, must, as I maintained, be liable to fade from exposure to daylight, that my opponents were wrong in their contention, and that certain pigments brought in question, such, for instance, as indigo, are of a very fugitive nature, and should in consequence never have been made use of by water-colour artists.

We have now, then, reached firm ground in this matter and practical service has been rendered to art, the value of which it is difficult to overrate.

It is very important now, however, that the public should not be misled, so as to be induced to form erroneous conclusions from the scientific evidence placed before them. This evidence, rightly understood and construed, is in a great degree encouraging, both to the possessors of water-colour drawings and to the professors of the art. It indicates possible methods and contrivances by which the difficulties attending the conservation of fine works of former times may be overcome, and if at first sight it may seem to offer a less advantageous prospect to the practising artist, in practically debarring him from the further employment of many convenient and favourite pigments heretofore in common use, the difficulty will probably be only a momentary one. It will, I have little doubt, be speedily followed, now that science has in earnest taken up the question, by the discovery of substitutes of assured durability and even more brilliant tints for the unreliable colours to be discarded. In the meantime further State assistance in this particular matter would be a timely and great boon to artists in all vehicles, whether water-colours or oil. The enlargement of the scope of the present Commission or the appointment of a new one of chemists and other physical scientists, for the investigation of the best methods of preparation of artists' colours and the purveyance of new permanent pigments to replace certain essential colours which at present have no adequately durable representatives, would be amply justified by present circumstances.

As regards the exhaustive experiments now furnished, as to the relative stability or the contrary of pigments, there is little that was not already well known. Similar experiments have been conducted scores of times before with the same results. One matter only is new, but that is of great significance, and will be of the very highest practical importance in its conse-

quences, if further elucidation and trial should confirm it. This is the fact, not before noted, that all pigments, whether acted upon or not under ordinary conditions of exposure to light, seem to be alike permanent *in vacuo*. I shall return to this matter again, especially as it seems to hold forth possibilities of practical adaptation of immediate utility and urgent needfulness.

In the meantime, I must call attention to some deductions made by the South Kensington experimenters in their report. The public has eagerly seized on the somewhat vague assurance that under certain conditions of exhibition water-colour drawings will last 480 years. Now, it would be a melancholy prospect to me if I thought that even in 480 years all vestiges of the glorious English water-colour art of the early part of this century should have vanished from the world; but on a more careful scanning of the evidence given in the Blue-book it will be seen that it does not require 480 or even 48 years' exposure to light to effect such alteration in many of the colours formerly, and indeed still employed, in water-colour painting as must transform and practically destroy, as coherent works of art, any drawings in which such pigments have been more or less freely used. We find, indeed (p. 45 of the Report), that an exposure of less than two years even to the mitigated side light of an ordinary room sufficed to produce visible and in some cases very noticeable fading in all the fugitive pigments.

Now, unfortunately, the great water-colourists, the Turners, De Wints, Copley Fieldings, and Barretts of the early part of this century seem to have been utterly careless as to the colours they employed, and to have had no thought whatever for the prospective durability of their works. At that time even the most notoriously fugitive pigments, such as indigo, brown pink, gamboge, crimson lake, vandyke brown, &c., may almost be said to have formed the chief staple of the palette in use. The merest evanescent stains, moreover, such as sap green and gall stone, which have long since been discarded as utterly unfit for use as colouring substances, were then indeed currently employed, apparently without the slightest misgivings.

When therefore it is complacently assumed by writers in the press, on the strength of mere cursory perusal of the intricate and far from lucidly expressed calculations of the South Kensington scientists, that water-colour drawings, "if painted with any but the most fugitive colours," may last for 480 years, they are simply preparing a fool's paradise for the public, inasmuch as the saving proviso does not apply; for it is scarcely necessary to repeat that water-colour drawings were formerly painted in great part with fugitive colours.

There is, in fact, urgent need on all hands for measures of protection for these fleeting treasures. Happily, the Commission seems to have opened for us one door at least of escape. Should this prove a real and effectual one, it is scarcely too much to say that the chief disadvantages of water-colour art will have vanished like an evil dream.

The discovery that pigments are all alike stable in a vacuum doubtless indicates the real cause of the bleaching process induced by daylight; it is the action of the oxygen contained in the atmospheric air.

Broadly speaking, this action goes on in the light only, and is inoperative in the absence of light. We know, in fact, that water-colour drawings do not fade if kept in the dark. That pigments of mineral origin should, as a rule, be more permanent than those of an animal or vegetable nature is easily to be understood upon this theory; such pigments are for the most part either metallic oxides or inert earthy substances coloured by such oxides. Such substances are naturally stable, inasmuch as they may be assumed to have already taken up all the oxygen with which, under ordinary conditions, they are capable of combining.

Are there any chemical means by which the action of oxygen can be prevented or counteracted in the case of pigments of animal or vegetable bases? This is perhaps a pregnant question to which chemical science may yet give an affirmative answer.

What, for instance, are the means by which stability is attained for so many brilliant dyes used in textile manufactures? Some of the admirable and infinitely varied tints obtainable from the aniline bases, in their nature fleeting as rainbow hues, can, I believe, by chemical means be fixed and rendered permanent. Why should not artists, colour manufacturers, and merchants be called on to bring to bear the same scientific energy and resource which our textile manufacturers have developed? All this, however, may possibly not be necessary, for if the golden vision opened to us by the South Kensington Commission is a reality, the simplest mechanical contrivances may hereafter be sufficient to secure eternal durability to water-colour paintings.

Water-colour drawings are necessarily preserved in one or other of two ways—either they are kept in the dark in portfolios or they are hung up framed under glass. Now, if the entire exclusion of atmospheric air should prove to be the sole condition for securing exemption from fading, *cadit questio*, so far as that difficulty is concerned, for surely it ought to be a

simple matter to practically preserve drawings in a vacuum under glass. It would be a mere question of secure framing; possibly merely placing the drawing betwixt two sheets of glass in close contact with them under pressure, the edges of the glass being then hermetically sealed might suffice. Theoretically this seems all that is requisite.

In any case, no time should be lost in verifying the efficacy or the contrary of the remedy, which the researches of the South Kensington experimenters seem to have furnished. It is a momentous, indeed an all important, matter, for it may give new and endless leases of life to the immortal works of a past age, and glad assurance and much-needed stimulus to a living and most admirable art. In any case, good will most assuredly come from the raising of this question, and it is not for me to be otherwise than contented with the part I have taken in it.

### CHURCH PLATE IN WARWICKSHIRE.\*

I WISH, in the first place, to draw attention to the east window of the south aisle of Brinklow Church, once a chapel of the Blessed Sacrament. For as we gaze upon that window, covered with peerless illustrations of the golden chalices of our old national church, we are able to realise the beautiful enrichment of the altars of the cathedrals and parochial churches, when in the fourteenth and fifteenth, and early part of the sixteenth century, on high festivals they were adorned with communion plate of the highest excellence and of the best and most artistic workmanship.

To this church, worthy in many other respects of the visit of the archæologist and the historian, many an artist now comes to make drawings of the paintings of the old chalices, so that they may be reproduced in our own age, to be used for the honour and glory of God. The first account we possess of the communion plate of our parish church is the inventory of church goods made in 1552, by order of Edward VI. The inventories of our county I have carefully studied, and the first thing that struck me was the great devastation that had been made previous to that time in the stores of communion plate. For when we compare these records with the requirements enforced by many of our archbishops, as, for example, Archbishop Winchelsey, 1293-1313, in respect to the church goods of our parish churches, the amount of church plate recorded in them is exceedingly small. And when we add to the plate belonging to the parish church that which was used in the Lady and other chapels, and especially that belonging to the chantries which were so often attached to our churches, and where the Blessed Sacrament was daily celebrated, we see at a glance how considerable the church plate must have been that was found in each parish before the Reformation. At the dissolution of the chantries and chapels, the properties belonging to them were seized at once by the Royal Commissioners. Nothing was left that had belonged to them except the bare walls. Their endowments and church goods were taken by the Crown. Nothing therefore was left to its parish church, except that which could be proved to belong actually to it, in the way of endowments or of church goods. Still, much plate must have remained. But from the year 1536, in different ways, the church plate considerably diminished. Sometimes this was caused by the action of commissioners sent by royal authority; sometimes the plate was stolen. In a few instances a portion was sold for repairs and for defraying the necessary expenses entailed by altering the churches so as to make them adapted for the ritual of the reformed Prayer-book. Church plate also was sold to glaze and repair the windows, out of which the fine old painted glass had been ruthlessly taken away.

In the year 1454, commissioners were appointed to take surveys and inventories of the goods, plate, jewels, bells, and other ornaments in all churches and chapels in the realm. These commissioners were to leave one chalice in each church, together with a small portion of the other church goods, and at least one bell. The ostensible object of these commissioners was to insure the preservation of all church goods that remained. But behind the scenes we find that other causes promoted the course that was adopted. In the Council Book, March 3, of the same year, we find the following entry:—"It was that day agreed that, forasmuch as the King's Majesty has need presently of a mass of money, therefore commissions should be addressed in all shires of England, to take into the king's hands such plate as remaineth, to be applied to the king's use." And again, on April 21, Edward himself writes:—"It was agreed that commissioners should go out and take certificates of superfluous plate for mine use." The commissioners were therefore appointed, and we have their reports.

The first thing I would remark in reference to these reports is the exceedingly few chalices (each chalice had a cover,

used as a paten, therefore we will say chalices and patens) that they found. In only a very few churches were there two chalices. There was, for example, only one in the Warwick church. There was a fair amount of vestments, altar cloths, brass candlesticks, censers and holy waterpots, though around Coventry there were churches where nothing was left, as we have no inventory for them, so that there seems to have been hardly anything after paying the expenses of the commission to fill the needy pocket of the poor young king. During the reign of Mary the small amount of plate that remained, as far as we can learn, was safely kept, so we must arrive at the conclusion that when Elizabeth became queen most of our parish churches possessed a chalice of the old shape as well as other ornaments for the church and minister. The question then arises, "How came it to pass that all these old chalices have passed away?" The answer is as follows:—In 1559, Archbishop Parker inquired in the visitation articles, Question No. 5, "Whether the curate or minister do minister in any profane cups, bowls, dishes, or chalices heretofore used at mass, or else in a decent communion cup kept for that purpose." In 1576 Archbishop Grindall made the same inquiries. How Archbishop Parker, who ever loved primitive and ancient customs, could have issued the first of these questions passes my comprehension. If the brass censers used by Korah and his company were sanctified, even the greatest Puritan ought to have allowed, with the open Bible before him, that these chalices could not have been profaned, however superstitious the older rites might appear to him. The result was that the old chalices disappeared, so we find nothing remaining of them in the church plate that has come down to us from the sixteenth century, except in a few very rare instances.

Amongst the communion services of our county, I have personally examined the larger portion of them; a fair number of these Elizabethan communion cups still remain—perhaps some twenty or thirty. They are all, as usual, very much of the same pattern, and this resemblance of the Elizabethan chalice is somewhat curious, as we can find no pattern selected and ordered by authority to be used at this time, and yet all over the kingdom one pattern is to be found. Sometimes they are called the 5 $\frac{1}{2}$  cup, as 5 $\frac{1}{2}$  was allowed to poor parishes for the purchase of them. The cup has a cover, which, as Grindall tells his clergy, may be used as a paten. They are, as a rule, about 5 inches high, in some cases rather higher. A few years later on we find another shape sometimes used, which was called the Puritan pattern. The cup itself became enlarged, and the ornamentation of the stem was different.

Amongst the plate of the sixteenth century, I must mention the fine silver-gilt chalices, with cover, belonging to the Holy Trinity Church, Coventry. In some instances these old communion cups and covers have passed out of use, modern service, much less elegant and less adapted to the purpose, having supplanted them of their birthright. I am glad to say that in some instances I have been the means of bringing them back again to their proper place and use. With the advent of the nineteenth century, we find the use of flagons becoming frequent. I cannot but think that their introduction was caused by the Puritan method of partaking of the Holy Communion. From the beginning of the seventeenth century the shape of the chalice varied, and since then there has not been any regular shape or size of the chalice in general use. In Warwickshire the distinguishing feature of the church plate in the seventeenth century is seen in the magnificent Dudley plate, given by Alicia Lady Dudley, relict of Sir Robert Dudley, to those parishes in which she had property. The earliest gift seems to have been presented in about 1630, at latest 1665. This plate, as Archdeacon Lee says, much resembles the plate which is now to be seen at Seville and other cathedrals in Spain. It consists generally of one large chalice, the cup part ornamented with leaves. One paten, one large flagon, one deep bowl, which is, I imagine, the bason for the alms of the people, and a plate. The following entry in one of the registers will give a good description of these munificent gifts:—"Whereas Her Grace the Duchess of Dudley—a foreign title in the county of Middlesex—owner of lands and tenements in Mare Cliff and Barton, in this parish, hath out of her pious disposition and benevolence towards the church, freely given and bestowed this Communion plate, to wit: a large flagon, a bread bowl, and a great chalice (in other churches there are two plates), besides all three having covers belonging to them, the said plate being richly gilt, and garnished with pictures and flowers, for the use of the Holy Sacrament of the Lord's Supper, to be administered in the same church, as an ornament suitable for the service of that most sacred banquet. With and upon this condition, that the sacred plate shall for ever solely remain for the use aforesaid, and shall not be diverted, employed, or disposed of for any other use; and upon this further condition, that if at any time hereafter the vicar, churchwardens, or other officers or inhabitants of the said parish for the time being shall presume or endeavour to alienate, sell, or embezzle, or otherwise dispose of the plate aforesaid, or any

\* From a paper read by Rev. G. Miller, of Radway, at the meeting of the Royal Archæological Institute at Leamington.

part thereof for the use aforesaid, that these gifts above mentioned shall become void and frustrate, and that for thenceforth the propriety and property of the plate aforesaid shall revert and be vested in the said duchess, her heirs and assigns, who shall have lawful right, and may demand and sue for and recover the same or the value thereof, from the parties so alienating, selling, and embezzling, or otherwise disposing of the plate aforesaid."

In examining our church plate I cannot fail to notice how small a portion of it dates from the time of the Civil War. No doubt a good deal of the old plate disappeared at that time, partly by being abstracted from the churches, partly from being melted down to defray the expenses of the war and the necessities of the time. With the advent of peaceful days, after the Restoration in 1660, the churches were refurnished with communion services. But, unless I am much mistaken, a considerable portion was, through want of money, made of pewter. Still large gifts of silver plate were made, much of which is decidedly good of its kind. And when the Church had regained her position in the reign of Queen Anne, large gifts of plate were made and continued to be made till the middle of last century. During this period the plate of our shire was naturally much increased, and the beautiful specimens of silver gilt plate to be seen at Baginton and Cubbington belong to this period. As the century passed on, but few services of communion plate were added, and it was not again till after the peace of 1815, and when quieter times prevailed, that our churches were once more enriched with the pious gifts of her children. But here I must not omit to mention the Stoneleigh plate given in 1805. Since the great Church revival, which dates from 1835, numerous beautiful additions have been made to our church plate, and once again we see the form of the old chalice reappearing in our churches. Amongst these gifts of chalices stands pre-eminent that which belongs to the parish church of Leamington, which, though given in our own days, really belongs to the time of Henry VIII. The cup of the chalice is silver gilt, richly embossed with figures. Round the lower part of the cup are designs taken from the events in our Blessed Lord's life. On the central bosses of the stem are the figures of Faith, Hope, Charity, and Justice. Round the foot we see Eve in temptation, Melchizedek, Abraham, Moses striking the rock, and the Israelites gathering manna.

Besides this chalice, there is a second of later date, with grapes and wheat ears carved on it. It is said that this chalice was given by Henry VIII. to the church at Calais. But how it left its abode there and came to England does not appear. There is also a second chalice, which seems to have been obtained to match, as far as possible, the one I have just alluded to. It is of more modern date, but very handsome. The shaft has bosses ornamented with cherubs; on the foot are the emblems of the four Evangelists. The cup is enriched with carving put on like appliqué work. If of English make it is unique of its kind, being of the period when no chalices were made in England excepting in the shape of cups. I would hazard the opinion that it might have been obtained from abroad.

#### BISHAM ABBEY.\*

THE Manor of Bisham (anciently called Bisteham or Bustleham) was given to Henry de Ferrars by William the Conqueror, and Henry de Ferrars's grandson Robert gave it to the Knights Templars, who built a preceptory here in the reign of King Stephen. On the suppression of the order of Knights Templars it was granted to the Knights Hospitallers, who could not have held it long, for in 1335 King Edward III. granted it to William Montacute, Earl of Salisbury, who soon afterwards founded a monastery here for canons regular of the Order of St. Austin. In the foundation charter its dedication is described as to "our Lord and His Mother the Blessed Virgin;" in a subsequent charter to the "Blessed Virgin" only, but in both deeds of surrender it is styled "the conventual church of the Blessed Trinity." Of that church he knew of no reliable information, but it had been urged by some, but without, he thought, any sufficient reason, that the present hall may have been a part of it. It was certainly a very large church, as ancient records sufficiently testify, and it was the burial place of many a noble personage, amongst them William, Earl of Salisbury, son of the founder, who distinguished himself at Poitiers; John, Earl of Salisbury, who was slain at Cirencester in 1401; Thomas, Earl of Salisbury, who fell in the siege of Orleans in 1428; Richard Neville, Earl of Salisbury and Warwick, who was beheaded in 1460; Richard Neville, the great Earl of Warwick, and his brother John, who both fell at Barnet in 1470; and the unfortunate Edward Plantagenet, Earl of Warwick, beheaded in 1499. To the memory of these great men

splendid monuments are known to have been erected in the conventual church, but even their exalted rank and famed exploits were not sufficient to spare their monuments from the destruction which followed the dissolution of the monastery. The surrender to King Henry VIII., according to Ashmole, took place on July 5, 1536, "basely and contrary to the most solemn oaths," but the following year the King restored the convent, increased its possessions, and changed its establishment to an abbot and thirteen monks of the Benedictine Order. Only three years afterwards he suppressed it for ever, its revenues being then estimated at 661*l.* 14*s.* 9*d.* per annum. King Edward VI. granted the place to his father's repudiated wife, Anne of Cleve, who—according to a letter which is preserved in the British Museum—obtained permission to exchange it with Sir Philip Hoby for his house in Kent. Sir Philip, it may be presumed, built the Elizabethan mansion, as we now see it, as an addition to what remained of the old abbey, the principal features of the earlier work being the pointed doorway and the hall of the time of King Stephen. The large bow window in the room generally known as the Council Chamber was an addition thrown out by Sir Thomas Hoby for the better accommodation of the Princess—afterwards Queen—Elizabeth, who was placed here under the care of Sir Thomas. Sir Philip died in 1558, and his brother, Sir Thomas, in 1566, and the costly monument erected to their memory was to be seen in Bisham Church. The treatment received here by Elizabeth was not of a harsh or disagreeable character, for when Sir Thomas went to Court after Elizabeth's accession, the Queen is reported to have said to him, "If I had a prisoner whom I wanted most carefully watched, I should entrust him to your charge; if I had a prisoner I wished to be most tenderly treated, I should entrust him to your care." The Hoby family retained possession till 1768, when it passed to the Mills, who were connected with the Hobys by marriage, and in 1780 the widow of Sir John Hoby Mill, Bart., sold it to Mr. George Vansittart, and it still remains in the same family. It would be disappointing if there existed no ghost story in connection with the history of this grand old mansion, and this one item of interest is not wanting. The story is that Lady Hoby, the wife of Sir Philip Hoby, appearing in the dress of a widow lady of the sixteenth century, haunts a particular bedroom in this mansion, where she has been seen trying to wash her hands in a self-supported basin. She is said to have beaten her child to death because he could not write his copies without making blots. It is certainly remarkable that some forty years ago, when the window-shutters of the haunted room were being altered, a quantity of children's copy-books of the time of Elizabeth were discovered with blots answering to the story. In dry weather the burnt condition of the grass gives indication, he was told, of the existence of the foundations of the ancient abbey, and the moat around the garden still remains.

#### SOUTH KENSINGTON ESTATE.

IN connection with the proposed buildings upon the South Kensington Estate, a correspondent of the *Times* writes:—

Her Majesty's Commissioners for the Exhibition of 1851 have revised the plan they had framed for erecting the new College of Music buildings immediately at the back of the Royal Albert Hall. Sir George Grove and his staff have been granted a site on the Prince's Gate side of the Kensington estate, where, through Mr. Samson Fox's munificence, their new building is to be appropriately constructed. The road which is to be cut across the northern portion of the estate will run close past the new College of Music buildings, and in front of the memorial standing on the terrace above the fountains of the Anglo-Danish Exhibition gardens. The conservatory immediately below the hall is to be pulled down and the quadrant arcades flanking it are to disappear, and stately private residences to arise in their place. A narrow garden or court occupying only a portion of the site of the conservatory is to intervene between the two blocks of private residences. There will be no carriage roadway round this narrow garden—the northern side of it will be dominated by the Royal Albert Hall and its southern entrances. This arrangement has been made with the aim of rendering a public approach to the south of the Albert Hall virtually impossible, and of securing, therefore, greater privacy for the occupants of the stately residences. But even from the house speculator's point of view this plan is not good. The question therefore arises with those who are jealous of architectural proprieties and have some regard for the interests of the Albert Hall, whether Her Majesty's Commissioners are not committing an error in proposing to fall back upon a policy which lowered them some few years ago in public estimation. This may be called the policy of repudiation.

The laying out of their estate as a garden with surrounding arcades was the result of co-operation between the Commissioners and the public. The public took debentures to

\* From a paper read by Mr. S. Slingsby Stallwood, architect, Reading, at the excursion of the Berkshire Archaeological and Architectural Society.

enable the Commissioners to carry out this work. But when feeble administration ruined the Commissioners' projects respecting their garden, the Commissioners threw the debenture-holders over without remorse. Similar policy is now at work in respect of the seatholders of the Albert Hall—notwithstanding that without the seatholders' assistance the Commissioners could not have called that edifice into being. The Commissioners assert a right to freedom of action in this contemplated treatment of the seatholders, who, no doubt, will be compelled to give way before it. Present gains appear to be more important to the Commissioners than considerations of how their acquirement may affect the Albert Hall in the future.

With the destruction of the conservatory, some of the prettiest arcades in modelled terra-cotta and brickwork of modern times will be likewise razed to the ground. Except at considerable expense no analogous architectural embellishment to the southern end of the Albert Hall can be substituted for the flight of stairs and the arcades just referred to.

Such pressure as has been successfully brought to bear upon the Commissioners to prevent the ruin of architectural proprieties in respect of the Albert Hall may now be exerted in favour of the retention of the staircases and arcades within the doomed conservatory. The first and obvious point to be pressed is that, between the two blocks of private residences to be erected upon the quadrant terraces, a minimum width of space equal to that now covered by the conservatory shall be maintained. An effect of spaciousness would thus be secured, and would enhance the value of the new houses, whereas if the present plans be carried out the architectural merit of the Albert Hall would be foolishly impaired by crowding against it a series of domestic buildings which from their necessities cannot possess any corresponding dignity of style in harmony with the great hall erected to the memory of the Prince Consort. Upon a question of æsthetic importance such as this the Commissioners will no doubt seek the opinion of the President of the Royal Academy, who is an *ex-officio* member of their body. The Prince of Wales, who initiated and is causing to be carried out the scheme for adorning the open space opposite Hyde Park Corner, will hardly stand by and allow the Commissioners to disregard the architectural unities of the Royal Albert Hall, the Imperial Institute, and the intervening new structures. If necessary an appeal to wealthy benefactors might be made for means to enable His Royal Highness to do at South Kensington what he is doing at Hyde Park Corner. The cost of the former would be considerably less than that of the latter. Five thousand pounds would probably be more than enough.

#### THE SOUTH WALES ART SOCIETY.

THIS Society, which has been lately founded by the energy of Mr. Edwin Seward, of Cardiff, has already gathered together a numerous body of those representative of art in the district. Lord Windsor is the president.

Mr. Walter Severn, the president of the Dudley Gallery, one of the first of London artists to associate himself with the South Wales Art Society, of which he and Mr. Seward are vice-presidents, has lately paid a visit to Cardiff, and during his stay was the guest of Mr. Seward. Mr. Severn inherits a name which in art circles holds a place of its own. Linked by family ties with that of John Ruskin, it is perhaps still better known in connection with that of John Keats, the author of "Endymion" and the "Ode to a Grecian Urn," who was long the bosom friend of Mr. Walter Severn's father. An introduction to Mr. Severn used to be the best of passports to all that was sound and good in the artist life of Rome, where he was for years the British consul. Half a century ago many a young artist discovered the benefits of an acquaintance with the well-known and genial artist-consul. Keats in his last illness accompanied Mr. Severn to Rome, but he died in a few weeks, and was interred in the English cemetery near the monument of Caius Cestius, and where Mr. Severn was afterwards buried by his side. Mr. Arthur Severn, a member of the Council of the Royal Institute of Painters in Water-Colours, is a brother of Mr. Walter Severn, and his drawings, especially of sea and coast scenery, will be well remembered by visitors to the Grosvenor Gallery and the Institute of Painters in Water-Colours.

On occasion of the visit of Mr. Severn, the President arranged a reception of the members at St. Fagan's Castle on Wednesday last, when Mr. Severn delivered an address on "Water-colour Sketching from Nature," about 100 members being present.

Lord Windsor in receiving the party said:—I am extremely glad to have this opportunity of welcoming you to these grounds of St. Fagan's Castle. You have been kind enough to invite me to become the president of this association, and I thank you very much for the opportunity you have given me of showing to all my neighbours in this part of the country and South Wales

how very much the duty is congenial to me. I think we have before us in this club a great deal of work to do, because we have to begin from the beginning. There has not been in the past exactly a home of art in South Wales, and, no doubt, we find some little difficulty in starting to combine all the talent and the interest we desire to combine in our association, but I feel certain, from the information that I have received from Mr. Seward, that the start of the club has been a very good one. I hear from Mr. Seward that very great interest has been manifested in the club, and that many meetings, both for lectures and for working out of doors, have already taken place, and I feel confident that with all the support that the members are anxious to give, our club will shortly take a prominent place in South Wales. We owe our special thanks this afternoon to Mr. Walter Severn for having very kindly consented to come down here to give us a lecture on matters intimately connected with the working of a sketching club. I am sure that no one can recognise more thoroughly than I do that it is of the utmost importance to us to get the countenance and support of artists of note and position in this country. We combine in our club several branches, several different states and degrees of artists. We embrace in our club professional artists, amateurs, and also students. These are placed in different classes. Our principal object is to endeavour to give the students of the club some means of enlarging their knowledge and their powers, and we can only hope to do this successfully if help is given to us by the artists of this country, who have a thorough knowledge of their profession, and who alone are able to give us thoroughly artistic advice.

Mr. Severn began his subject with remarks more particularly of local interest. Cardiff, he had been told, was a tremendously busy place, so busy, indeed, that the town had no time for art. In this connection he would remind Cardifians that "all work and no play made Jack a dull boy," and apart from that, there was the fact that the number of cultured people in the world was increasing enormously, and those people required that everything to be done for them should be done with taste. The manufacturers who could not satisfy this fastidiousness would be left behind, so that even in commercial centres it would be wise to cultivate taste, which, after all, was only another word for art. Giving the results of many years' experience, he dealt with the study of sketching from Nature from all points of view. To paint what was called a complete sketch it was necessary to catch Nature, as it were, and reproduce her in one particular mood. Ruskin, who had written so usefully about careful work and finish, said, "Good painting can only be acquired by rapid and varied practice from Nature." He explained how rapidity of execution could be best attained, particular reference being made to throwing in the shades, and passing under review such matters as lights, stippling, glazing, tones, and perspective, emphasising the need of having in the selection of subjects what the Italians call a *motivo*. In concluding he advised students to lose no opportunity of observing Nature alone. Of the student of art it ought to be said, "Never less alone than when alone."

On the motion of Lord Windsor, seconded by Mr. T. H. Thomas, a vote of thanks was passed to Mr. Severn, and likewise to the President, in proposing which Mr. Seward stated that Lord Windsor had kindly consented to send some of his drawings to the exhibition which it was intended to open at Cardiff next month, and also to permit a magnificent bronze Mercury to be used in the decoration of the art gallery. Lord Bute, too, had very generously intimated that he would subscribe 10% to the funds of the Society on account of the exhibition.

#### TESSERÆ.

Chancels in Italy.

A. ASHPITEL.

I WATCHED the practice in different towns in Italy, and there found, invariably, that the laity, men and women, entered what we should call the different chancels, when mass was said, and took their seats in the stalls or wherever was most convenient. On inquiring further I found this was and had been always an invariable custom, and still further discovered the word chancel is never applied to any portion of the building, but only to the gates and railings, "cancelli," which separate the various chapels from the other parts of the church; that what we call the choir is by them called by its primitive name "tribune"—the ancient *βήμα*; and that the "coro" or choir is in any place, side chapel or otherwise, where it may be conveniently held, and, besides this, that it is shifted from place to place at different times according to weather, and not only so, but that in most cases it ceases to be called the choir when the choir, or monks who form the choir and who sing the breviary services, have left it. But still, and here seems the point whence all these errors have arisen, while it is a choir—that is, while the breviary or choir services are going on—the gates or "cancelli" are carefully closed; sometimes

curtains are drawn before them, and the laity are always rigidly excluded. A still more striking instance is found in the Jesuit churches, which are all built without chancels or choirs. Ignatius Loyola found the system of assembling every three hours for short services so interfered with the life of active exertion which he required from all his followers, that this obligation is omitted in his constitutions, and, as thereby choirs would have been useless, they are never erected in Jesuit churches.

#### The White Ground in Painting.

W. LINTON.

Wax was the most important ingredient in the vehicles for painting employed by the ancients. Its use is traceable from the early ages of Egypt, and throughout those of Greek and Roman art. It was extensively and almost exclusively used by the early Christian painters, and continued to be commonly employed till a late period in the Middle Ages. There is also abundant evidence of the use of resins by the ancients, and the employment of such substances among the ingredients for painting, as well as for varnishes, was continued after the invention and improvement of oil-painting. The process which has been found most satisfactory is that which excludes the fixed oils as much as possible, substituting for them wax, resin, and an essential oil. As a first condition affecting the durability and brilliancy of the work, a ground of pure white is recommended. In this the practice of remote antiquity has been confirmed by the best modern authorities. The Egyptians, in the preparation of the surface for painting on walls and on mummy cases, have left proofs of the estimation in which white grounds were held in the earliest times. The practice of the Greeks and Romans is exemplified by the prepared white tablet which was found among the ruins of Herculaneum. Aristotle among the ancients, and Leonardo da Vinci and Armenini among modern writers, speak of white grounds as essential to the brightness and durability of pictures. Caravaggio and others of the "Tenebrosi," on the contrary, who were instrumental to the decline of art by employing dark grounds, have proved that the effects of time are accelerated by that practice. Many of the works of Tintoret have suffered from the same cause.

#### Dampness in Foundations.

VANDOEYER.

A wall constructed of brick or stone of any quality whatever will be subject to the damp which exists in the soil, and which will enter in all directions and in all parts, where the wall is in immediate contact with the ground. The extent to which this damp will penetrate cannot be determined, and it may rise to a very great height above the level of the soil; and if it be arrested more or less, that will be caused by the influence of the neutralising power of the temperature of the atmosphere; so that a wall which may be very damp at the beginning of summer will be much less so at the end of the dry season, and particularly so if immediately exposed to the sun, but the following winter the damp will return unless the original causes of humidity be subdued. It is desirable in all and every class of soil to have a substratum of concrete under the footings. For the purposes of damp this need not be very deep, perhaps not exceeding a foot high. As soon as the footings and lower part of the wall are carried as high as the level of the ground inside it will be well to introduce a thin sheet of lead the whole thickness of the wall, or a layer of bituminous substance as thin as possible, so as to penetrate the brick and stone and fill the pores, or a double course of thick slate set in cement. The purpose of the sheet of lead and of the bituminous substance, and the slating, is to prevent the wet from rising up from the footings. But other precautions are necessary to prevent the access of damp from the surface of the ground next the outside face of the wall. A facing of stone is the best remedy. It need not be very thick, but it is well for it to be at least 2 or 3 feet high; and if a small interval between this facing slab and outside surface of the wall, so much the better, providing a circulation of air be kept up in the space. By this provision neither the rain beating against this part of the wall, nor the water returning from the pavement or ground, will be able to reach the main substance of the wall; for although the facing slabs may be temporarily damped, they will soon be dried without communicating the damp to the body of the wall. The inside of external walls should never have the plastering applied immediately on the face. They should be battened by means of long narrow slips of wood attached by hold-fasts to the inside face of the wall. These slips or battens receive the laths upon which the plastering is applied. The space formed by the battens between the wall and the lathing effectually keeps out the humidity. No impervious covering should be laid on wooden floors in the lowermost storey, such as oil-cloth, for instance; a certain moist air always rises from the ground, and escapes through the joints of the boards, but if this be intercepted by an oil-cloth, the air will rot the boards and oil-cloth in a very few months. But it is important to

keep the damp from the floors which come upon the ground, that is, the floors of the lowermost storey. It is evident that the timber of stone slabs should not be in immediate contact with the soil. For this purpose let a stratum of concrete be laid over the whole surface of the house, 6 or 9 inches thick at the least. Upon this form sleeper walls or piers up to the necessary height, and on them lay the plates or paving slabs. As an additional precaution, a thin sheet of lead might be laid under each pier on the bed of the sleeper walls. In palaces, as a greater precaution, and in buildings where expense is a secondary object, a thickness of asphalt might be laid on the concrete. In the dwellings of the poor it is expedient at all events to have the sleeper walls or piers, which need be only half brick wide and one course high, without the cement, and generally that will be a sufficient precaution. Where stone paving forms the floor bricks must be laid under all the joints. Thus will the humidity be more or less prevented from reaching the floors. But of all precautions to prevent damp entering by the face of the wall, the best remedy is to have an area, which, by keeping the soil at a distance, preclude its fatal effects on the wall. These areas may be 3 or more feet wide, and may serve as a passage all round the building, and afford access to cellars outside, as in the London houses; or if this, from want of space or the expense, be impracticable, it will be sufficient to have what are called blind areas, with convex walls against the earth, the points of contact with the outer wall of the house being as small as possible, to diminish the possibility of the communication of damp.

#### National Style.

R. REDGRAVE.

Style, indeed, will be universal in proportion as the sentiment which inspires it is more or less widely prevalent, more or less akin to our common nature; and on this account those styles which have arisen out of the religious sentiment are generally co-extensive with the religion which produced them. When these influences arise out of the purer and nobler qualities of man's nature, the style they produce will be noble also, and being constantly around us, contribute in no small degree to raise the tone of individual and national feeling. The influence of a mean style, founded upon the ignoble or sensual qualities, will in a like degree tend to degrade not only our taste but our moral intellect also. Thus the governing influences of Greece, when her art was formed, were the worship of the Deity through his created forms and attributes of beauty; and a sentiment of purity and beauty became the characteristic of Greek art. In the latter days of this people, when the poetical religion gave way before the subtilty of her philosophers, the sense of the beautiful only remained, and the principle of her art, deprived of the zealous fire that even an imperfect religious sentiment inspires, became more sensual under the domination of abstract beauty only. When the Greeks were conquered by the Romans, and their artists transplanted to serve the conquerors, they brought with them their own dominant principle, sensuous beauty. This, however, alone, ill suited the spirit of their proud rulers. In the full career of universal conquest, pomp and splendour were their governing influences, and a new style was formed, wherein a degree of barbarous grandeur dominated over the element of beauty. As the Romans, from being the conquerors became the conquered, their art died out under the mean and contemptible desire to appear what they no longer were; having no influence sufficiently strong to inspire their artists, they became degraded imitators, and even broke down the mighty works of their fathers to build trophies to call after their own names. The all-pervading spirit which had been present in the growth of Roman art being gone, Europe was ready for the new influence which, gradually working on society, was to pervade all the nations in various degrees with the spirit of Christianity, and to produce the new styles called Romanesque and Gothic, wherein the sentiment of religion again largely prevailed. And perhaps the very circumstance that religion was presented by means of art materially to the senses, rather than spiritually to the reason and intellect, increased the universality of the influence. Not only had the churches, but the houses and all the worldly goods of our fathers, the outward impress of these new styles, which appearing first in the erection and decoration of splendid temples devoted to the worship of the Deity, gradually gave to all things an ecclesiastical character also. When, from the causes before glanced at, the Renaissance of ancient art took place, it was impossible that any sentiment of religion, which, in its own age, it might have possessed, could be reborn with it; the beautiful only was sought in this revival; beauty, however, more or less tainted with the sensuality and pride of the peoples from the study of whose remains the resurrection to new life had been attempted. Revived without a thorough identity between the sentiment of the age, and the sentiment of the past which produced it, this style became at once subject to national modifications. In our own country it resulted in the Tudor, a style redundant yet mean, grotesque without ingenuity, and without any constructive truth or consistency. It bore the impress of a people

willing to borrow their art at second-hand rather than to endeavour to cultivate it at home. Flemish, Italian, and French versions of the Renaissance were mixed up in a strange medley with the Gothic of the preceding age, and it had a character arising out of its very errors and absurdities.

#### French Realistic Painting.

C. GINDRIEZ.

All these great art-problems are mostly questions of temper, and the naturalist school would only be unfaithful to its principles if it should wage war against tendencies the first reason of which might be found in nature and physiology. It is certain, for instance, that man's beauty is more accentuated in proportion as it differs more widely from the apeish characters: anything that brings him nearer to them gives him an ignoble and bestial appearance. Man's beauty evidently tends to an ideal which is the type of the race—a type which is never perfectly realised, but for which we have a right to seek. Plato puts this ideal behind us, and Mr. Darwin puts it before us: there is only a difference of position. We do not go further and further from it; probably we tend to it: at any rate it exists. We certainly take an interest in all the scenes of life, whether it be high or humble, opulent or poor, heroic or vicious; hence the development which modern art and literature have taken in France. But notwithstanding the present popularity of brutal realism, with its cynic nakedness and violent crudity, it has little chance of growing strong and of striking deep roots in our soil. The French genius is realistic neither in philosophy, in literature, nor in politics. It is curious that the French, who have often been reproached so justly with restricting the world to the limits of their own country, should have in the domain of ideas an irresistible need of expansion and generalisation. Whoever speaks eloquently or wittily of the French is popular in France; but whoever speaks thus of humanity is more popular still. It is at once the quality and the defect of the national mind, that Frenchmen believe themselves made to be listened to by the whole world. They have waged wars for ideas; their painting is more general than any other in the world; their revolution in philosophy (the Cartesian) was more general than that of Bacon; their political revolution has consecrated not only the rights of France, but especially the rights of humanity. It is this love for abstraction which keeps up among the French a taste for what they call "great painting"—that is, painting without any anecdotic or local character. We may say that France is now the only country in Europe where historical painting still reigns with a sort of religious respect and official lustre. It would have been dead a long while since, here as elsewhere, had it not been for State encouragement. Our houses are too small for those large canvases, which lack air in our modern rooms, narrow and multiplied as cells in a bee-hive; therefore historical painting is dying, notwithstanding the artificial processes which give it a sort of galvanic life. But, nevertheless, some valorous artists still dream of Michel Angelo, Raphael, Rome, and Florence, and cover with painting a few fathoms of the walls in the Salon. It is the tradition; historical painting is in their blood, and they have aptitudes accumulated by heredity. However, the science of nudity is drifting more and more away from nature; we feel too much that the art created by our artists is secondhand, and that their painting lives upon remembrances.

#### The Alhambra and the Mosque of Cordova.

F. Y. HURLSTONE.

Elegant and beautiful as it is, the Alhambra was a work of the decadence of the Moorish architecture. It was erected the last, and not until after the fall of the brilliant empire of Cordova, its superior in arts, in science, and in arms, as well as those of Valencia and Seville. Its foundation was, indeed, the result of the fall of this latter kingdom or pachalic. One circumstance alone, although it is descending to minutiae, bespeaks the inferiority of the Alhambra as an architectural monument to the Mesquita of Cordova and the earlier Moorish works. It is that the ornamentation (which is the prominent feature of the style) is of necessity one of lath and plaster, which could not be executed in stone. There is the beautiful honeycomb ornament for instance, which imparts such a charm to the Hall of the Ambassadors, it would be impossible to express in stone. As also, the essential dependence of this style of ornamentation upon colour, of which a striking illustration may be seen in the archway of the ancient Moorish palace of Bâdis, now called the Casa del Carbon, on the Darro, which is as fine as anything in the Alhambra, in fact is identical with the best of it, but having been whitewashed it loses more than half its value; whereas the ornamentation of the Mesquita of Cordova, no less charming in taste, is wholly produced in stone cutting, as the beautiful interlaced ribbon ornament, &c. From the accounts drawn from both Arabic and Spanish sources, as well as from those traces, faint indeed, but unmistakable, presented by remains like the Mesquita of Cordova and the Giralda, if not the Alcazar of Seville, the Arab architecture had attained a far

higher perfection than the Alhambra of Granada would evince. Notwithstanding the mutilations, and, what is worse, the disfiguring additions to the Mesquita of Cordova, it is evidence of the surpassing genius of the Moors. Startling from its novelty, and the inventive powers displayed, it remains one of the most impressive monuments in Europe. It is, indeed, worthy of a journey to see it—to form an idea of the effect of its naves and transepts, its intersections of nineteen longitudinal rows of columns, with twenty-nine transverse rows, originally twelve hundred columns. The labyrinth of these colonnades over an extent of 2,400 feet is utterly bewildering, as it is unequalled. For myself, I must say that I never was so impressed with any building, on first entrance, as the Moorish mosque of Cordova. The choir, or whatever that portion of the building was in the time of the Moors, was unfortunately altered by the bishop, and against the judgment of the corporation, so late as the time of Charles V., who, in this instance, reproved what he himself afterwards did at the Alhambra:—"You have built here what you or anyone might have built anywhere else, but you have destroyed what was unique in the world. You have pulled down what was complete, and you have begun what you cannot finish." The alteration is in the Florid Gothic, in its last and expiring form, in the beginning of Charles V.'s reign. It is not undeserving of admiration in itself, and is less incongruous than might have been expected with that curious monument.

#### Flow of Water through Pipes.

J. NEVILLE.

A cylindrical pipe, flowing full, discharges less than the same pipe when only filled through a segment whose arc is  $281^{\circ}30'$  by 2.5 per cent., while the velocity is less by 9.5 per cent., the hydraulic inclination being the same. The full section discharges less, and also with less velocity, in other forms of pipes as well as in cylindrical ones. The scouring power of circular pipes, flowing full, is therefore less by nearly 10 per cent. than that of the same pipes filled through an arc of  $281^{\circ}30'$ —a new element to be considered in the arguments for and against circular pipe sewers.

#### The Portico of Octavia, Rome.

R. BURGESS.

Near to the theatre of Marcellus stood the famous Portico of Octavia. The first marble building ever erected at Rome was a portico which stood on this self-same site. It was built by Metellus Macedonicus: two temples were comprised within it. The architects were two Spartans, whose names were Sauros and Batrachus. They not only contributed their skill, but, as they were rich men, they employed their wealth also in the undertaking. The only reward for their services which they asked of the Romans was that their names might be mentioned in an inscription on the temples; but this honour being refused, they contrived to introduce their names allegorically. Sauros meaning a lizard and Batrachus a frog, those animals were introduced into the capitals of the columns. The architects of the Portico of Octavia were also Spartans, and they respected the works of their distinguished countrymen. The new portico comprised in its circuit the two temples, made more magnificent and probably much enlarged. The fragment of the Pianta Capitolina, with the mutilated inscription "CVS OCTAVLÆ," gives us the plan of those splendid works. Bellori, in his illustration, computes about 270 columns. The principal remains consist in six large columns of the vestibule or entrance (and who that has seen Rome has not admired the magnitude and elegance of those Corinthian columns), eight more columns of the exterior row of the peristyle, and there are also further remains of one of the temples to be seen in a Vicolo behind the church of St. Angelo: three columns standing at an angle indicate the position of the prostyle of the Temple of Juno; the other was dedicated to Jupiter. In the Temple of Juno was her statue, made by Dionysius and Polyclus, and a Venus by Philiscus of Rhodes. In the corresponding Temple of Jupiter was the much-admired statue of the god, which was equally well executed by those sons of Timarchus. There was a group representing Pan and Olympius wrestling together, the work of Heliodorus, and perhaps the Venus of exquisite beauty which Pliny tells us adorned this portico (the work of Phidias) may be the very Venus de Medici which Santo Bartoli declares was found here in the Pescheria. In a part of the building called the Schola Octaviæ was the famous Cupid of Praxiteles, which called forth the eulogia of Cicero, Strabo, and Pausanias. It is more than probable that several of those statues perished in the fire which took place in the reign of Titus, and still more might be lost in that which happened under Sep. Severus. The paintings which adorned the walls and vaults were not less celebrated. There was the famous work of Artemon representing Hercules ascending from Mount Ceta to Olympus, having put off his mortality with the consent of the gods; there was the painting by Antiphilus, where four figures of satyrs were grouped around the noble Hesiod; and Alexander and Philip, with Minerva,

JUBILEE MEMORIAL FOUNTAIN, ST. MARY'S BUTTS, READING.

THE foundation is of concrete, which is taken down some distance below the road, to allow space for a subway, which is constructed from one side to the other, so that access can be had to any portion of the interior when required. A separate pipe and tap is used for each water supply, and the water can be drawn out of each pipe and basin, and the whole left dry before the commencement of winter to prevent the action of frost. The lower basin is oval, and occupies the whole of the space allowed. The north and south ends are paved with Wycombe paving, and at each of the four corners are red granite guard piers. There are eight granite guard posts with iron railing and gutter, to protect the fountain from being damaged by cattle, &c. The moulded plinth coping, &c., is of solid Portland stone, and at the north and south ends drinking basins are sunk in the coping, and provided with cups and chains. The overflow from the basin is used to supply a stone trough for dogs below. From the centre of the lower basin is raised a block of masonry, the external portion of which is composed of alternate bands of red Mansfield and white Portland stone, the central band having carved ornamentation representing the English rose, and the upper band water lilies in various stages from the bud to the flower. At equal intervals round the central block are eight polished Peterhead red granite columns, with carved capitals, each one being of a different design, the whole supporting a beautifully carved and moulded frieze which forms the second basin. Running round the frieze in bold relief letters is the following inscription:—"Erected to commemorate the fiftieth year of Her Majesty's reign. 1887." Above the inscription is a carved band representing the shamrock and thistle; at equal intervals between each column are eight carved gargoyles or grotesque heads, each one of a different design, and from the mouth of each a flat sheet of water is discharged into the basin below. From the centre of the second basin is raised a small oval block, composed of bands of red Mansfield and Portland stone, surrounded by four small columns of polished granite with carved capitals supporting a solid oval brown Portland stone, which is surrounded by twenty small water jets, each one playing up the stone and falling back over the edge below. This stone is encircled by a band of carving representing the British oak. On the top of the stone is placed a single polished red granite column; this is surmounted by a second capital, on which are two lions back to back, each with a shield, one bearing the Royal Arms and the other the Borough Arms, the side spaces being filled up with carved water lilies, bulrushes, &c. From the centre of the lions rises a white stone carved finial, which is finally surmounted by a beautifully carved crown and coronet, from the centre of which is the top water jet. A strong copper pipe is carried up the centre, so that the wind cannot affect the stability of the upper portion.

The whole has been carried out from the designs and under the superintendence of Mr. G. W. WEBB, A.R.I.B.A., 14 Friar Street, Reading, whose design took the first place in the competition. The contractors were Messrs. WHEELER BROS.

## A PUBLIC FOUNTAIN.

MANY plans have recently been brought forward for dealing with the open space adjoining Piccadilly Circus, but in most cases they have been upon far too extensive a scale to be adopted. The idea in the present scheme is to restore the plan of the former Circus by erecting a valuable block of buildings upon the vacant site, harmonising as far as regards height, but not design, with the existing surrounding buildings, and thus continuing the symmetry of NASH's fine thoroughfare. The ground floor of the buildings it is proposed to treat as a vaulted arcade open to the public.

The fountain we illustrate would be erected against the wall of the building upon the corner piece of ground facing Waterloo Place and Piccadilly. It has been treated in character somewhat similarly to the Fontaine Ste. Michel and the Fontaine Molière at Paris, or to the Fontana di Trevi at Rome—that is to say, having a substantial architectural erection in the background, with water pouring down in volumes from the inside and overflowing from basins at its foot, as indicated upon the plan, this treatment seeming to adapt itself better to such a position than that of a large jet or jets of water as at Trafalgar Square, the ill results of which may be seen upon a windy day, when the effect of the fountain is quite destroyed. There is no doubt that for such a fountain this would be one of the finest as well as most conspicuous sites in London.

The design is by Mr. H. P. BURKE-DOWNING, architect, of 26 Craven Street, Charing Cross.

## VILLA RESIDENCES AT WESTON-SUPER-MARE.

OUR illustration represents one portion of a row of semi-detached houses recently erected in the Beaconsfield Road, Weston-super-Mare, and may be considered a fair average type (of the class) of the prevailing villa architecture of this fast-growing town. With regard to the architectural treatment, although the style adopted for each block varies, the main outlines and features are similar, producing a pleasing variety as well as an harmonious effect. The whole were erected by Mr. CHARLES ADDICOTT, builder, of Weston-super-Mare, from the designs of Mr. SYDNEY JOHN WILDE, architect, of the same town.

## THE LATE MR. JOHN M'LEAN.

THE death of Mr. John M'Lean, architect, of Stirling, took place last week. Originally a mason, Mr. M'Lean had the charge, under the late Mr. Rothead, architect, of the construction of the National Wallace Monument on the Abbey Craig, a work which he satisfactorily completed. He was afterwards appointed Master of Works for the burgh, and in this capacity he designed and partly carried out the feuing of the Hospital lands, the drainage and blocking of the streets, and other improvements. Latterly he devoted his whole attention to his work as an architect, and the result is to be seen in the numerous villas in the West End, the Stirling Arcade and Town Hall, Coathill House, and many other buildings, public and private, in the town and surrounding district. Mr. M'Lean, who was about fifty years of age, leaves a widow and grown-up family.

## ANTIQUITY OF CIRCEUM.

IN the course of a letter, the Roman correspondent of the *Times*, writing from St. Felice Circeo (Island of Oea), says:—

That the peninsula which now ends in Monte Circeo and is unmistakably identified with the Oea of Homer, was once an island is demonstrable by geological evidence, and of its being inhabited in the earliest stages of civilisation there is proof. A grotto on the sea side of the mountain, known as the Grotto of the Goats, shows perforation of the pholas in great abundance at an elevation of 30 or 40 feet above the surface of the sea; and this elevation is greater than the level of the Pontine marshes, which intervene between the Circean Cape and the semicircle which lies beyond the marshes and limits them. A subsidence of half the height of the band of pholas work from the sea level would bring the sea over the entire plain, and make Oea again an isle, and perhaps restore a part of its enchantments.

It is clear from the history of the early Roman wars with the tribes which inhabited the low-lying Volscian country, that the entire section now occupied by the Pontine marshes and once covered by the sea, was at that date firm and inhabitable land. The earliest political history we have shows that it was, when that history was made, in that condition, and justifies the conclusion that it is now really subsiding, and that therefore the reclaiming of the district is at best a very uncertain undertaking, an economical result which I offer *en passant* to the Royal Commission for the drainage of the Pontine marshes; but my use of the fact is to point out that the Homeric knowledge of Oea must have been far more ancient than anything we generally connect with the era of the "Odyssey." If 700 years before the Christian era the Ager Pomptinus was good land, fit to fight over, and for long after one of the great sources of the

grain supply of Rome, how many years must have elapsed since it was covered by the Tyrrhenian sea? I ask, not to get an answer, but to point out the immense antiquity of the Homeric tradition of the Island of Circe.

What we know by early Latin tradition of sufficient authority is that there was here a city called Circeum, which practically retained its civic existence until the Social war, but of the site of which there has been much dispute. There need have been none, for the prehistoric record is much clearer than the geological to one who knows how to read it. A diligent search into the stonework, which is the only sure evidence in the centuries preceding the introduction of letters, shows that the modern town from which I date this letter is built on an angle of the Pelasgic city, and the further and complete investigation discovers one of the most interesting of the enormous series of early Italian (Pelasgic) cities. The Roman city was on the same site, as is shown by superstructures of Imperial masonry, and the town was an important possession of the Caetani during the period of the contests of that family with the Popes, but was utterly destroyed at some time prior to the sixteenth century; for we find in the record the permission given to reconstruct it about 1550; and that the reconstruction was complete is evident from the character and absolute similarity of all the houses, not a trace of anything older than the sixteenth century occurring anywhere.

But, the exterior houses of the town being so arranged as to form a wall of defence, we find that the foundations are laid for three sides on a Pelasgic wall of the earliest type, and that the wall on the north and south formed one of the most stupendous city enclosures I have yet found in Italy. The ancient city was built on a plateau about 400 feet above the sea, irregular in form, and following the outline of the level land on the east, north, and south-east, and then, by a gentle elevation for about a furlong, rising towards the mountain which dominates it and up the mountain side until it meets the foot of a precipice, on the summit of which, at a height, as well as I could estimate, of 1,200 feet, is a citadel of the most admirable polygonal construction, of which one angle still measures 20 feet in height. One of the gates, or, I am inclined to think, the only gate, is still in tolerable condition, and in construction resembles the sally-port of Mycenæ. The total circuit of the original wall must have been about two miles, and near the shore are the remains of two towers, apparently intended for the protection of the port, and opposite them is, in fact, a basin whose bottom is now nearly 20 feet above the sea level, so regular in form that it may well have been artificial, the shoreline of those days, when it could have served, being bold and rocky, not at all adapted to the hauling ashore of ships.

Nothing can give a better idea of the relative density of the population of ancient and modern Italy than the comparison of the ruins of these Pelasgic cities with their modern substitutes. The modern city of Palestine is built on the terraces of the Temple of Fortune, and the village of St. Felice Circeo is included in the space between two angles of the old wall, the narrowest face of the polygon it formed, and covering only a fraction—at a guess I should say the thirtieth part—of the rising land on which the ancient city was built, and excluding the steep mountain-side, where the wall was merely a completion of the defence and a curtain to secure the communication with the citadel above, which completed the circuit. And there are, I am told by Fontanarive, who has made special investigations into this class of ruins, 400 places in the part of Italy which may be called Pelasgic, which indicate the existence at some time of cities of that epoch to which belong also the ruins of Tiryns, Mycenæ, and many unnamed and forgotten cities of the Greek islands and coasts. The magnitude of the works here indicates a large population and a highly-organised labour, for in the best work the stones are fitted with the utmost precision by hammering alone, and in these ruins of Circeum there are blocks 10 feet in length, fixed in their places on a steep mountain-side, where to place them without modern machinery would task the powers of modern man. And what the social and civic condition of the place was the enormous strength and the propinquity of these great fortifications indicate. If the defence is formidable, so must the attack have been, and we may construct the society of the Pelasgic epoch as one in which every city was at war with every other, and in which war was carried on with energy and organisation such as we have but a feeble conception of.

Another result not without interest in this connection and having regard to recent discussions is the conclusion, now adopted by all the Italian authorities on this subject, and of which we get here unusual affirmation in these ruins, that the citizen of the archaic city lived in wooden houses or in tents of skins or cloth. I have examined many of the ruins of this class, and only in one case have I found any indications of interior construction, and these, in one of the least elaborate—the ruin on Aetos in Ithaca—were evidently intended for treasures, the walls of the compartments having the solidity of the walls of the city. That the houses of the archaic period were of wood is, moreover, indicated by the Doric Temple,

which is based on the construction of the timber house transferred to stone and the hut urns in the early Italian graves, which were doubtless the commemoration of the residence of the deceased while he was still among the living.

The extreme antiquity of Circeum, shown in the style of the earlier work, or it may be the more hurried, gives a peculiar value to the technical indications, owing to the climate being extremely favourable to the integrity of the worked surfaces of the stone, and the unusual elaborateness of the works gives an archaeological value to the site which very few archaic Italian cities possess. In Terracina, ten miles away, we have, in the cuttings for the Appian way, of the original work of Appius Claudius, the surfaces showing the chisel marks almost perfect, so that we have every right to assume that those at Circeum have with an unusual fidelity preserved the testimony of the ages as to the condition of the arts at the day when they were built. The lichenous grey which marks the original surfaces of the hardest limestone here, and which has not yet returned to the Appian cuttings, so that they look like new surface still, compared with the natural cliffs, has everywhere come back to these Pelasgic walls, but the resumption of nature has gone no further. What a suggestion of antiquity!

### ST. MARY'S CHURCH, WARWICK.

THE members of the Royal Archaeological Institute made an excursion to Warwick during their congress, where St. Mary's Church was visited and the Rev. Mr. Case, in the absence of the vicar, read a paper describing the church from an historical and architectural point of view. The church existed, he said, prior to the Conquest, though there was no record of the date of its actual foundation. He traced the history of the church, noting the work of rebuilding the choir, begun in 1367 by the Earl of Warwick, Thomas Beauchamp, till it was dissolved under Henry VIII. and, after being shorn and clipped, the fabric was conveyed by the Commissioners to the inhabitants of Warwick. In the fire at Warwick, in 1694, the tower, nave and transept of St. Mary's were destroyed. Subscriptions were immediately set on foot, and commissioners were appointed by the Crown to superintend and direct the rebuilding of the church. At one time there was an idea of placing the work in the hands of Sir Christopher Wren. This was, for some reason, abandoned, and Sir William Wilson was appointed to erect the new building, and to him must be assigned the incongruity of the present structure. He also rebuilt Four Oaks Hall and Nottingham Castle.

In describing the church, said Mr. Case, the first part to which I shall direct your attention is the tower. It consists of three stages in height, in the lowest of which four very massive piers support arches of a pointed form. Above each of these arches is a pointed arch of blank panel work, divided by a shaft of clustered reeds, with a capital formed of the acanthus leaf. In this are two small perforated lights, and on each side two semicircular niches of semi-classic design, with projecting brackets at the base. This stage is divided by a cornice supporting a balustrade, and adjoins the roof of the church. Immediately above this balustrade, on the north, west, and south sides, are tablets, recording the erection and rebuilding of the church. The second stage is similar to that below, with pointed arch panelwork and semicircular niches; the division between it and the stage above is worked with a horizontal cornice moulding. The third stage of the tower contains on each side four pointed single-light windows, two immediately above the other two; these have on each side two niches at the top. There is a cornice above and blocking course, on the face of which are shields (twelve in number), with the armorial bearings of the families that have held the Earldom of Warwick. The whole is crowned by a parapet with large square crocketed pinnacles at each angle, and a smaller pinnacle rising from the middle of the parapet. The composition is partly Classic, partly Gothic. Though the tower is faulty in detail it is very striking in appearance, and a conspicuous landmark. As stated in the inscription, the old tower with the nave and transepts was burnt down in 1691. The new tower was twice rebuilt; the first tower, which was deemed unsafe, was 98 feet high, the second and present tower is 166 feet high. The windows are eight in number, piercing the north and south walls of the aisles and transepts. They are said to be miserably designed: each has six semicircular-headed lights; the head of each window is filled by a huge light of a horse-collar form. In the spaces between the windows there are buttresses of meagre design. A horizontal cornice runs along the top above the windows, and an open balustrade parapet, with stone urns at intervals. The gable front of each transept is surmounted by an urn, the symbols of Paganism taking the place of the Christian emblem, the cross. Entering the church, we see that the nave is divided from the aisles and transepts by four arches, pointed in form, and supported by piers. The roof is arched and ceiled, and each bay is

divided into eight compartments by small plaster ribs, and at the intersection of the ribs is an escutcheon surrounded by scrollwork. The transepts are shallow in proportion, and consist of only one bay of vaulting in addition to the bay of the breadth of the aisles. In the old nave there were many interesting monuments of the deans and secular canons of this church, and the burgesses of the town, which were completely destroyed by the fire which consumed the nave. It appears that there was one chantry attached to the church, which had an altar dedicated to St. Anne. It was founded by Sir Robert Walden, 2 Henry IV. The chantry is supposed to have been the present lobby.

The oldest part of the church, that which remains of the time of Roger de Newbury, is the crypt under the choir. It is divided into two parts by four piers, each part containing five bays of vaulting. The three westernmost piers, with the three bays of vaulting, exhibit Norman architecture of the early part of the twelfth century. The fourth and easternmost pier is a plain but massive octagonal pier, in the Decorated style of the fourteenth century, with a moulded capital. This and the two easternmost bays of vaulting are the work of Thomas Beauchamp, who died 1369. The crypt appears to have been lighted by five windows, of which only one in the easternmost bay remains perfect; the others have been partially filled up. That portion of the crypt lying below the vestry is now a burial vault for the Earls of Warwick, converted to that purpose about 1770. The choir is said to have been finished by the second Thomas Beauchamp, A.D. 1392. But Mr. Bloxam thinks from the depressed four-centred arch of the large east window, and the panelwork with which the east wall of the choir is covered, that alterations must have been made by Richard Beauchamp, Earl of Warwick, who founded the chapel of Our Lady. The monument in the centre of the choir is that of Thomas Beauchamp, the second of that family. Thomas (his second son), who succeeded him, finished the choir begun by his father, and newly built from the ground the whole body of the church.

The lady chapel, commonly called the Beauchamp Chapel, from the founder, is one of the richest of the structures erected as mortuary chapels during the fifteenth century. It has suffered much from desecration. On June 14, 1642, a band, under Colonel Purefoy, entered the chapel and defaced its monuments. The altar with its decorations was, it is supposed, then broken down. The present altar-piece, representing the Annunciation of the Blessed Virgin, was the work of Collins, a stonemason in Warwick, and erected in 1735. This chapel was founded by Richard Beauchamp, Earl of Warwick. The chapel took twenty-one years in building, being finished in 3 Edward IV., 1464. On the south side is a small wooden piscina, a very rare and curious example of that feature. A flight of well-worn steps leads to some perforated wooden panelwork, and to a small aperture through which the elevation of the Host at high mass might be seen. This little chapel may have been constructed for the performance of low mass by a single priest in commemoration of the founder of the chapel. The four barred helmets were originally part of the funeral achievements fastened over the monuments in this chapel; one of these is supposed to have belonged to the Marquis of Northampton, who was buried in the choir of the church.

#### STRATA FLORIDA ABBEY.\*

SINCE the meeting last year at Denbigh, when Mr. Williams said he had read a paper on this subject, the further excavation of the site of the Cistercian Abbey Church of Strata Florida had been carried out under his direction. The committee of the Cambrian Archaeological Association determined to recommence the work of excavating the site of the abbey church in May last. At that time the funds subscribed for the purpose only amounted to 90%, but during the progress of the works subscriptions had been received and promised raising the amount available for clearing the site of the church, sacristy, chapter-house, and part of the cloister to 145%. On May 24 last the works were recommenced, and a staff of men had been employed continuously up to the 4th inst., when, the whole of the funds being exhausted, it was considered desirable to suspend operations.

The whole of the site over which they had permission to excavate was within the churchyard of the parish of Strata Florida, a very extensive churchyard, but, fortunately, no modern burials had taken place in that portion of it occupied by the ruins or immediately surrounding them. Externally the north wall of the north transept had been cleared, also the east and south wall of the presbytery, the east wall of the chapels on the south transept, and the sacristy and chapter-house, disclosing the freestone plinths and

\* From a paper read by Mr. Stephen W. Williams, F.R.I.B.A., of Rhayader, at the meeting of the Cambrian Archaeological Association at Cowbridge.

magnificent buttresses. A portion also of the south wall of the nave had been cleared in the cloisters, enabling them to find the south-east door of the nave, with its very beautifully moulded jambs, perfect for a height of nearly four feet. One jamb was also discovered of the south-western doorway of the nave, opening into the western alley of the cloisters, and at the north-west angle of the nave the base of the angle buttress had also been found. The outer walls of the nave did not appear to have had buttresses corresponding with the responds of the piers in the aisles. The excavation of the external face of the walls of this portion of the church had disclosed the fact that buttresses were built to take the thrust of the groining and arches at every point, and that the greatest care was taken to build them solidly and well. Following the line of external excavation, they came to the north transept, the whole external face of which had been cleared down to the original ground level, and it had enabled them to find the plinths of the square buttresses, of Norman type, and the elaborate moulding of the north door. The external wall of the west end of the presbytery, like the north face of the north transept, had been cleared down to the original ground level, and there were, in addition to the angle buttresses, square pilasters carried up between the centre and side lights of the east window, which was a triplet; and these pilasters, like the buttresses, were of ashlar work. Externally, on the eastern side of the south transept had been found a series of monks' graves, some of which have still their carved headstones *in situ*. Continuing the excavation along the face of the eastern wall of the south transept, they discovered still *in situ* the window of the sacristy. Beyond this there was a change in the character of the walls, the workmanship being inferior. The chapter-house had the foundation still remaining of the stone bench upon which the monks sat in conclave, and masses of the entrance doorway had been found, consisting of arch moulds, bases, and capitals, and a portion of the base mould of one side of the door still *in situ*. The character of the mouldings found were clearly of later date than the church, and were of Early English type, whilst all the work in the church itself was distinctly Transitional or late Norman.

Returning to the interior of the church, and commencing at the west end of the nave, one of the most important and interesting facts discovered was the finding of the western respond of the south arcade *in situ* for a height of 10 feet above the floor level of the nave. He believed he might venture to say that at Strata Florida they had found a most unique and peculiar type of arcade. Alterations had been made in the shape of the piers subsequent to the great fire, and he found that fragments of moulded work had been used as quoins in repairing the damage caused by the burning of the abbey church in 1284. Originally, all the piers were of oblong plan, but had been altered at some later period, probably after the fire. In the course of his concluding remarks Mr. Williams said he had recovered singularly beautiful tile pavements, in which were the dragon of Wales, a griffin, the arms of the De Spencers, &c., in patterns that were unique. He believed he had discovered probably the finest series of tile pavements ever seen in any ruined abbey in England and Wales. He then went on to speak of the elaborateness of the carving throughout, and asked, Who were the workmen? Was there a school of native workmen? Finally, he asked for further funds to carry on the good work of discovery.

#### OLD GLASGOW.

TILL the present century was considerably advanced, the civil, judicial, and penal functions of the municipality of the western burgh, like those of most other centres of the same kind throughout the country, were conducted under one roof. It was only under pressure which could not be resisted that the Town Council came to the decision that city affairs pure and simple should be carried on in premises specially dedicated to this purpose. Mention was made of a "Tolbuyth," the *Scotsman* says, as far back as 1454, the year in which there was reference to John Stewart as the "first provost that was in the city of Glasgow." It was situated at the north-east corner of Trongate and High Street, and it rested upon a piazza, within which, on the street level, were booths occupied by the leading shopkeepers for the manipulation and sale of their wares. The rents derived from those places were applied to the maintenance of the Council hall and prison cells, and "to na uther use." Archaeologists have been forced to the conclusion expressed by Mr. Andrew Macgeorge in "Old Glasgow"—"We have no account of its appearance, or when it was erected." In consequence, largely, of "the mercantile genius of the people," which Thomas Tucker, one of the Scottish Commissioners of the Commonwealth, observed during his residence in what he was then pleased to praise as "a very neate burgh town, consisting of foure streets handsomely built in form of a crosse," the old structure became inadequate

for the requirements of the city. The Corporation in 1625, when James Inglis was Provost, "all in ane voice hes concludit" that a new Tolbooth "sall be buildit with diligens" in the same locality. Diligence was indeed manifested in the operations, for in the following year the minutes adverted to the finishing of "the steppill head," which is still one of the architectural features of the central district of the western city. It was within this "legal fortress" that Sir Walter Scott laid a well-known scene in his "Rob Roy." Sir William Brereton, in 1634, observed that the "structure is said to be the fairest in this kingdom;" while Franck, another English visitor, in 1658 remarked that it is "a very sumptuous, regulated, uniform fabrick, large and lofty, most industriously and artificially carved from the very foundation to the superstructure, to the great admiration of strangers and travellers." For nearly two centuries the work of the city was concentrated in this erection. Of the accommodation a considerable portion was required for lock-up purposes, and a special allowance was made to the gaoler for keeping "warlocks and witches," while public executions took place in front of the building. The civic authorities in 1736 added a Town Hall immediately to the west of the Council Chambers and communicating with them. It was a handsome apartment with a coved roof, and it was decorated with paintings and sculpture. On various occasions important gatherings took place within its walls. The receipt of the intelligence that, according to the Jacobite lament, "The die was risked and foully cast upon Culloden day," produced quite another strain within its precincts. For the Provost and his fellow members of the Town Council, and the principal and professors of the University, with other leading citizens, met there to rejoice over the decisive result of the battle. The final event in its history was a corporation dinner at the inauguration, in 1854, of the equestrian statue of the Queen, provided by public subscription, as a memorial of Her Majesty's visit in 1849. Intact till 1874, it was then incorporated by the City Improvement Trust with the Tontine Building, now one of those large drapery warehouses forming a feature of the city.

It became evident early in the present century that the Tolbooth had ceased to be adequate for the wants of the city. The result was that the first portion of Bridewell was built in Duke Street, where there is still a prison for persons incarcerated for short periods. Of course this relieved the pressure of the old place of confinement, but it left the Council Chambers and Court-rooms in as unsatisfactory a state as before. During the two years from 1807 to 1809 the subject of new buildings was gravely canvassed; and in the latter year it was resolved to have these on the Laigh Green at the foot of the Salt Market. Plans by Mr. William Stark, Edinburgh, were approved in 1810; and the structure was estimated to cost 20,000*l.*, but the contracts amounted to 22,000*l.*, while the actual outlay was 34,811*l.* The members of the committee in floating the scheme expressed "their conviction of how salutary, how comfortable, and how beneficent in every point of view a new gaol, Court-house, and other offices must necessarily be, and how ornamental such a building must prove to this populous, increasing and flourishing portion of the Empire." The foundation-stone was laid by Lord Provost Black, and by-and-by the fine pile which stands in Jail Square, opposite the western entrance to the Green, was ready for use. It is now almost entirely employed for Court-house purposes, the High Court and the Sheriff Courts holding diets there; but it is occasionally utilised in other ways, the recent Boundaries Commission having had it for its meeting place. On the erection several alterations were lately carried into effect, and under a special Act one half of the cost of the improvements was borne by the Government, which also defrays the expense of maintenance. The place had only been occupied a few years when it was ascertained that another shift would have to be made, and a battle of sites raged somewhat fiercely for a time. One influential party was anxious to convert St. George's Church into municipal buildings, and another to have the seat of local government returned to the neighbourhood of the Cross. In the end a compromise was effected, and, under an Act passed in 1836, a new edifice for the accommodation of the municipal authorities and of the Sheriffs and Justices of the Peace was agreed upon on a site between the two points mentioned. Once more the design for the buildings, which with the site cost 54,000*l.*, came from Edinburgh, the architects chosen being Messrs. Clarke & Bell, a young firm which, in consequence of this success, removed from the east to the west country. Operations were begun under the superintendence of the members of the firm, and the foundation-stone was laid with considerable pomp by Lord Provost Campbell. The front elevation to Wilson Street of these buildings, which, like their predecessors, are now almost entirely given over to Court-house purposes, is exceedingly handsome, and the façades to Hutchison and Brunswick Streets are also very fine. For thirty years the municipal officials occupied the west side of the block, and the Sheriffs the east one, but the growth of the city by-and-by told upon both the departments, and yet

another change became inevitable. In passing notice may be taken of the fact that Sheriff Alison, the historian, and Sheriff Glassford Bell, the poet, were among those who occupied the bench in the buildings. It was ultimately agreed that the municipal should leave the legal authorities in full possession of the original structure. The question of site again occupied the attention of the public, and one section of the citizens, headed by Lord Provost Rae-Arthur, advocated the acquisition of the ground on the east side of George Square, now secured, with the view of providing offices for all the municipal departments, while another urged the appropriation of the remaining ground between Wilson and Ingram Streets. On the matter being referred to the Town Council, the vote was in favour of the latter project, and after a good deal of trouble the buildings were altered, in accordance with plans prepared by Messrs. Clarke & Bell, while in 1874 they were available for occupancy. Hardly were the officials settled in their new quarters when it became obvious that the action taken could only be regarded as a temporary expedient to be followed by a larger scheme. Lord Provost Bain revived the George Square scheme in 1877, when it met with general approbation, an Act in favour of it being passed without opposition in the following year. The purchase of the property was at once carried out with comparatively few wrangles, and the price paid for it, including law and other charges, was, in round figures, 173,000*l.*

#### FERNIHERST CASTLE.

WORKS for the preservation of the fine old baronial castle of Ferniherst, an ancient seat of the Kerrs, situated on a high bank of the Jed, about two miles from Jedburgh, have been undertaken by the Marquis of Lothian. The walls, both outside and inside, have been cared for, and a strong buttress has been erected at the back of the castle to support what was considered to be a somewhat weak part of the building. This buttress has a moulded vase—copied from the north transept of Jedburgh Abbey of the fourteenth or beginning of the fifteenth century—and is surmounted by a tower similar in design to the bartisans at the corners of the keep, but of somewhat larger dimensions than these. The old kitchen, with its enormous fireplace, has had its barrel-vaulted roof covered with cement, so as to prevent water percolating down through the masonry. The outward appearance of the upper storey of the keep has been much improved by the restoration of two dormer windows which had disappeared, and which were restored from an old engraving. In the interior, however, the greatest change is observable. Originally there were three floors, but these were in so unsafe a state that they had to be removed, and instead of putting in three as formerly, there are now only two, with a balcony underneath, which passes along two sides of the building. The upper room, as well as the bartisans, has been lined with yellow pine, and the arched roof has been treated in the same manner. An ogee moulding runs round the room at the wall-heads. The joists which support the upper floor are also of yellow pine; but those of the floor below are of oak. The balcony under these is of the same material, and the balusters are of old-fashioned design. The staircase leading from the entrance to the first landing is broad, while those of the storeys above are narrow and of a spiral character. The broad stair has been restored, the steps being of a darkish red sandstone, and having a moulding similar to the original. A great improvement has been effected on the gateway which led from the inner to the outer court on the side next to the Jed. This gateway, which is surmounted by the arms of Andrew, Lord Jedburgh, was much dilapidated, but has now been restored to its original character. The mouldings on one of the jambs were entire, but from the other a number of moulded stones had disappeared. These have now been filled anew, and the arch strengthened. The outer court wall has long since been levelled with the ground, but the workmen came upon the foundation while cutting a drain down towards the bank. While making an opening in one of the walls of the keep an old staircase was discovered, but was built up again. This led, it was supposed, to one of the vaults. The other and larger portion of the castle buildings is still used as a dwelling-house, and has been tenanted for many years by Colonel Paton. Ferniherst Castle is of considerable historical interest, not only because it was for several centuries the home of the Kerrs, but also for the scenes it witnessed during the Border wars. It was taken by the English under Lord Dacre in 1523, immediately after the storming of Jedburgh by the Earl of Surrey, and retaken on behalf of the famous David Kerr by a body of French soldiers under command of Monsieur Desse. It afforded an asylum to the fugitive Earl of Westmoreland in 1569, and in revenge for this the Earl of Sussex laid the castle in ruins the following year. It must, however, have been speedily repaired, as we are told that in 1571 the Earl of Ruthven "destroyit the biggings of Ferniherst, the corners, and all that he could be master of."

"Antiquity after a time has the grace of novelty."—HAZLITT.

### RESTRAINTS ON THE GROWTH OF LONDON.

A CURIOUS collection could be made of the complaints by men who supposed they were patriots against the growing of the metropolis. On first sight it may appear better to live in a house in the country or in a country town, but London could not have attained its present size if a large number of people had not discovered that it was better to live there than elsewhere. It is as futile to put a restraint upon the speculators and the builders' work as to adopt the Partingtonian system of keeping out the Atlantic. The following paper by Isaac Disraeli will suggest the vain endeavours of Governments to oppose a social tendency which has attained the power of a law of nature, but after all, the attempts to put down building and keep London from going beyond its ancient boundaries is in keeping with many other foolish deeds which are now revered as the wisdom of our ancestors.

Recently more than one of our learned judges from the bench perhaps astonished their auditors by impressing them with an old-fashioned notion of residing more on their estates than the fashionable modes of life, and the *esprit de société*, now overpowering all other *esprit*, will ever admit. These opinions excited my attention to this curious circumstance in the history of our manners—the great anxiety of our Government, from the days of Elizabeth till much later than those of Charles II., to preserve the kingdom from the evils of an overgrown metropolis. The people themselves indeed participated in the same alarm at the growth of the city; while, however, they themselves were perpetuating the grievance which they complained of.

It is amusing to observe, that although the Government was frequently employing even their most forcible acts to restrict the limits of the metropolis, the suburbs were gradually incorporating with the city, and Westminster at length united itself to London. Since that happy marriage their fertile progenies have so blended together, that little Londons are no longer distinguishable from the ancient parent; we have succeeded in spreading the capital into a county, and have verified the prediction of James I., that "England will shortly be London, and London England."

"I think it a great object," said Justice Best, in delivering his sentiments in favour of the Game Laws, "that gentlemen should have a temptation to reside in the country, amongst their neighbours and tenantry, whose interests must be materially advanced by such a circumstance. The links of society are thereby better preserved and the mutual advantages and dependence of the higher and lower classes on one another are better maintained. The baneful effects of our present system we have lately seen in a neighbouring county, and an ingenious French writer has lately shown the ill consequences of it on the Continent."

These sentiments of a luminary of the law afford some reason of policy for the dread which our Government long entertained on account of the perpetual growth of the metropolis; the nation, like an hypochondriac, was ludicrously terrified that their head was too monstrous for their body, and that it drew all the moisture of life from the middle and the extremities. Proclamations warned and exhorted; but the very interference of a royal prohibition seemed to render the crowded city more charming. In vain the Statute against new buildings was passed by Elizabeth; in vain during the reigns of James I. and both the Charleses, we find proclamations continually issuing to forbid new erections.

James was apt to throw out his opinions in these frequent addresses to the people, who never attended to them. His Majesty notices "those swarms of gentry, who through the instigation of their wives, or to new-model and fashion their daughters (who if they were unmarried, marred their reputations, and if married, lost them), did neglect their country hospitality, and cumber the city, a general nuisance to the kingdom." He addressed the Star Chamber to regulate "the exorbitancy of the new buildings about the city, which were but a shelter for those who, when they had spent their estates in coaches, lacqueys, and fine clothes like Frenchmen, lived miserably in their houses like Italians; but the honour of the English nobility and gentry is to be hospitable among their tenants." Once conversing on this subject, the monarch threw out that happy illustration, which has been more than once noticed, that "gentlemen resident on their estates were like ships in port; their value and magnitude were felt and acknowledged; but when at a distance, as their size seemed insignificant, so their worth and importance were not duly estimated."

A manuscript writer of the times complains of the breaking up of old family establishments, all crowding to "upstart

London." "Every one strives to be a Diogenes in his house and an emperor in the streets; not caring if they sleep in a tub, so they may be hurried in a coach; giving that allowance to horses and mares that formerly maintained houses full of men; pinching many a belly to paint a few backs, and burying all the treasures of the kingdom into a few citizens' coffers; their woods into wardrobes, their leases into laces, and their goods and chattels into guarded coats and gaudy toys." Such is the representation of an eloquent contemporary; and, however contracted to his own age might be his knowledge of the principles of political economy, and of that prosperity which a wealthy nation is said to derive from its consumption of articles of luxury, the moral effects have not altered, nor has the scene in reality greatly changed.

The Government not only frequently forbade new buildings within ten miles of London, but sometimes ordered them to be pulled down—after they had been erected for several years. Every six or seven years proclamations were issued. In Charles I.'s reign offenders were sharply prosecuted by a combined operation, not only against houses, but against persons. Many of the nobility and gentry in 1632 were informed against for having resided in the city contrary to the late proclamation. And the Attorney-General was then fully occupied in filing bills of indictment against them, as well as ladies, for staying in town. The following curious "information" in the Star Chamber will serve our purpose.

The Attorney-General informs His Majesty that both Elizabeth and James, by several proclamations, had commanded that "persons of livelihood and means should reside in their counties, and not abide or sojourn in the City of London, so that counties remained unserved." These proclamations were renewed by Charles I., who had observed "a greater number of nobility and gentry and abler sort of people, with their families, had resorted to the Cities of London and Westminster, residing there contrary to the ancient usage of the English nation"—"by their abiding in their several counties where their means arise they would not only have served His Majesty according to their ranks, but by their housekeeping in those parts the meaner sort of people formerly were guided, directed, and relieved." He accuses them of wasting their estates in the metropolis, which would employ and relieve the common people in their several counties. The loose and disorderly people that follow them living in and about the cities are so numerous, that they are not easily governed by the ordinary magistrates; mendicants increase in great number; the prices of all commodities are highly raised, &c. The King had formerly proclaimed that all ranks who were not connected with public offices, at the close of forty days' notice should resort to their several counties, and with their families continue their residence there. And His Majesty further warned them "not to put themselves to unnecessary charge in providing themselves to return in winter to the said cities, as it was the King's firm resolution to withstand such great and growing evil." The information concludes with a most copious list of offenders, among whom are a great number of nobility and ladies and gentlemen, who were accused of having lived in London for several months after the given warning of forty days. It appears that most of them to elude the grasp of the law had contrived to make a show of quitting the metropolis, and, after a short absence, had again returned, "and thus the service of your Majesty and your people in the several counties have been neglected and undone."

Such is the substance of this curious information, which enables us at least to collect the ostensible motives of this singular prohibition. Proclamations had hitherto been considered little more than the news of the morning, and three days afterwards were as much read as the last week's newspapers. They were now, however, resolved to stretch forth the strong arm of law, and to terrify by an example. The constables were commanded to bring in a list of the names of strangers, and the time they proposed to fix their residence in their parishes. A remarkable victim on this occasion was a Mr. Palmer, a Sussex gentleman, who was brought, *ore tenus*, into the Star Chamber for disobeying the proclamation for living in the country. Palmer was a squire of 1,000*l.* per annum, then a considerable income. He appears to have been some rich bachelor, for in his defence he alleged that he had never been married, never was a housekeeper, and had no house fitting for a man of his birth to reside in, as his mansion in the country had been burned down within two years. These reasons appeared to his judges to aggravate rather than extenuate his offence, and, after a long reprimand for having deserted his tenants and neighbours, they heavily fined him in one thousand pounds.

The condemnation of this Sussex gentleman struck a terror through a wide circle of sojourners in the metropolis. I find accounts, pathetic enough, of their "packing away on all sides for fear of the worst," and gentlemen "grumbling that they should be confined to their houses"; and this was sometimes backed too by a second proclamation, respecting "their wives and families, and also widows," which was "*durus sermo* to

the women. It is nothing pleasing to all," says the letter-writer, "but least of all to the women." "To encourage gentlemen to live more willingly in the country," says another letter-writer, "all game-fowl, as pheasants, partridges, ducks, as also hares, are this day by proclamation forbidden to be dressed or eaten in any inn." Here we discover the argument realised in favour of the Game Laws of Mr. Justice Best.

It is evident this severe restriction must have produced great inconvenience to certain persons who found a residence in London necessary for their pursuits. This appears from the manuscript diary of an honest antiquary, Sir Symonds D'Ewes; he has preserved an opinion which, no doubt, was spreading fast, that such prosecutions of the Attorney-General were a violation of the liberty of the subject. "Most men wondered at Mr. Noy, the Attorney-General, being accounted a great lawyer, that so strictly took away men's liberties at one blow, confining them to reside at their own houses, and not permitting them freedom to live where they pleased within the King's dominions. I was myself a little startled upon the first coming out of the proclamation, but having first spoken with the Lord Coventry, Lord Keeper of the Great Seal, at Islington, when I visited him, and afterwards with Sir William Jones, one of the King's justices of the bench, about my condition and residence at the said town of Islington, and they both agreeing that I was not within the letter of the proclamation, nor the intention of it neither, I rested myself satisfied and thought myself secure, laying in all my provisions for housekeeping for the year ensuing, and never imagined myself to be in danger till this unexpected censure of Mr. Palmer passed in the Star Chamber; so, having advised with my friends, I resolved for a remove, being much troubled not only with my separation from Records, but with my wife, being great with child, fearing a winter journey might be dangerous for her." He left Islington and the records in the Tower to return to his country seat, to the great disturbance of his studies.

It is, perhaps, difficult to assign the cause of this marked anxiety of the Government for the severe restriction of the limits of the metropolis, and the prosecution of the nobility and gentry to compel a residence on their estates. Whatever were the motives, they were not peculiar to the existing sovereign, but remained transmitted from cabinet to cabinet, and were even renewed under Charles II. At a time when the plague often broken out, a close and growing metropolis might have been considered to be a great evil; a terror expressed by the manuscript writer before quoted, complaining of "this deluge of building that we shall be all poisoned with breathing in one another's faces." The police of the metropolis was long imbecile, notwithstanding their "strong watches and guards" set at times; and bodies of the idle and the refractory often assumed some mysterious title, and were with difficulty governed. We may conceive the state of the police when "the London apprentices," growing in number and insolence, frequently made attempts on Bridewell, or pulled down houses. One day the citizens, in proving some ordnance, terrified the whole court of James I. with a panic, that there was "a rising in the city." It is possible that the Government might have been induced to pursue this singular conduct, for I do not know that it can be paralleled, of pulling down new-built houses by some principle of political economy which remains to be explained or ridiculed by our modern adepts.

#### A College of Architecture.

SIR,—As you allowed me to open the discussion of this subject, I dare say you will permit me briefly to say a few closing words. Though, as an elderly man, not accustomed to be very sanguine, still I have been very much pleased with the latter part of Mr. Fleming's letter in this week's *Architect*, for I have great faith in a small beginning, provided it represents an admitted want. Energy and union are then generally sufficient to secure success. I shall therefore live in hope that his "next winter" will prove to be "the last winter of our discontent" in this important question of architectural education. I shall be happy to help in any way. If "the Association" only establishes in practical form a scheme of education in construction and architectural science under which the youngest pupil will be taken in hand by competent teachers until he is ready to present himself for that final ordeal, the R.I.B.A. examination, all that I have contended for will be secured with the single exception of the college building. However, still relying upon small beginnings, this, if it should be felt to be a necessity, may form a crowning work at some future day, not very long deferred, I hope; for, as I said at the outset, it is difficult to understand how all can be well with us when every other educated body has its collegiate establishment while the

architectural profession alone is without one. Without a college I fear we shall never attain to that position of dignity in the social scale which it is certain we are entitled to. We must be true to ourselves. Our realm is the realm of science, art, and industry, and surely the professors of these difficult pursuits deserve to be held in the highest honour by society. Found a college, and we forge the missing link. Thanking you, Mr. Editor, for so kindly giving your aid in the consideration of this important question, I am, faithfully yours,

The writer of the article,  
"A COLLEGE FOR ARCHITECTURE."

#### Theatre Exits and Fire Risks.

SIR,—I read with much pleasure and interest the letter which appeared in your last issue from Mr. Paul Lamberts. Personally I am also not a believer in the much-vaunted use of asbestos as a preventive of fire. And I think it important that the theatre-going public and the press should insist upon theatres being built on sound principles of construction, and that the scenery and accessories should be covered with a non-inflammable composition, as it is well known that most fires in theatres arise from contact of flame with the light woodwork and canvas with which the stage is surrounded.—Yours &c.,

AN ARCHITECT.

#### GENERAL.

**A Sum of Twenty-five Guineas** has been offered by an anonymous donor to the Art Committee for presentation to the painter of the best landscape in oils shown at the forthcoming picture exhibition at the Art Gallery, Wolverhampton. Landscapes only from the counties of Staffordshire, Warwickshire, Salop, and Worcestershire are eligible. The Mayor has offered a prize of twenty guineas to the painter of the best original figure subject in oils.

**The Autumn Exhibition** at the Manchester City Art Gallery will open to the public on September 4.

**A Private View** of the autumn exhibition of the Birmingham Society of Artists will take place on Monday.

**Dr. J. E. Elam**, a native of Leeds, died on June 25 in Auckland, N.Z., where he had been resident for the last twenty-five years. The bulk of his property, which it is expected will realise between 7,000*l.* and 10,000*l.*, he has left for the purpose of founding a permanent school of art and design for the town of Auckland.

**Mr. James Bolton**, of Wigan, has been appointed borough surveyor of Oswestry. There were 120 applicants, the salary being 200*l.* a year.

**Mr. W. Howard Seth-Smith**, of London, has been appointed architect of the new Marling Grammar School, at Stroud, Gloucestershire. The governors have secured a fine site, 8 acres in extent, near the town.

**Plans** have been prepared by Messrs. Kendall & Bakes, of Idle, for a Methodist chapel proposed to be built at Rodney.

**Plans** have been prepared for the extension of the barracks at Perth, to furnish accommodation for 400 additional men.

**Remains** of old pottery have been found at Dummer, near Basingstoke. The vases are coarsely made, either very slightly baked or sun-dried, and ornamented with bands not unlike the Norman dog-tooth, made apparently with a pointed stick.

**The Sketch-Book** of the Glasgow Architectural Association has been published, being the third volume of the work. It contains thirty-seven plates, accompanied by six pages of letter-press.

**Applications** to the number of 150 have been received for the office of borough surveyor of Sheffield, for which a salary of 800*l.* per annum is offered. Candidates have been selected to attend the next meeting of the Town Council on the 28th inst.

**A Church** designed by Mr. John Honeyman has just been opened in the picturesque village of Gullane, East Lothian, which is now much resorted to by golfers and summer visitors. The building is close by the ruins of what was once the parish church, that dates back to the time of William I.

**The Parish Church** of St. James, Norton Canes, Cannock, which was destroyed by fire in January last, is being rebuilt and enlarged under the direction of Messrs. Osborn & Reading, architects, Birmingham, by Messrs. Treasure & Son, of Shrewsbury.

**The Death** is announced of Mr. W. Eassie, C.E., at his residence, South Hampstead, on the 16th inst. The first excavations on the site of old Troy were made by Mr. Eassie at the close of the Crimean campaign, long before the time when Dr. Schliemann undertook his exploration.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

## BEST GREEN ROOFING SLATES.

Unrivalled for Quality, Colour, and Durability.

Highest Award, Gold Medal from the International Exhibition, London, 1862.

The Buttermere Co.'s Green Slates were selected by eminent Architects for the "MODEL DWELLING" in the Newcastle Exhibition Grounds, 1887.

For Prices and Particulars apply to SECRETARY,

BUTTERMERE GREEN SLATE COMPANY, LIM., KESWICK.

THE WEAVER," "THE IMPERIAL," & "THE OXFORD," Patent Sanitary and Ventilating Appliances.

NOTE.—All Closets are fitted with the "Weaver" Flush Fan, with Waterfall Action. (The "Weaver Flush Fan" being adaptable to ALL KINDS of Closets. Licenses may be granted to Manufacturers.) The Flush Tanks are noiseless. There is greater flushing and cleansing power than in any other closet. Trappage up to 3in. With a supply of the Iodate Sanitary Salt to the Tanks, these Closets are odourless. Lead Closet Traps or boarded floors, 7s. 6d. and 10s. 6d. Ball Valves to Flush Tanks for quick filling under low pressures. 3in., 2s. 6d.; 3in., 3s. 6d., and Stop-cock, 3s. 6d.

N.B.—The Interceptors and all other Traps are absolutely self-cleansing, and dispense with grease collectors. Illustrated List, also "Instruction in Sanitary Construction" (Domestic Section, abbreviated), and "Memorandum on House Sanitation and the Law of Landlord and Tenant thereon," by K. Weaver, C.E., F.C.S., Sanitary Surveyor, free by post.

The Domestic Engineering and Sanitary Appliances Company, 24 High Holborn, London, W.C.

**FIREPROOF.**—Pure Charcoal Swedish Galvanised Flat Sheet Iron, for Roofing Purposes, instead of Zinc or Lead. Can be Bent and Hammered without Cracking.—E. JANSSON & CO., 41 Bishopsgate Street Within, E.C.

**CASES FOR BINDING THE ARCHITECT.**

Price Two Shillings.—Office: 175 Strand, London, W.C.

H. FLEWELLING, Wootton Bassett (accepted).	

**TRADE NOTES.**

NEW mills have been erected at Langley, near Nottingham, and special attention has been paid to the ventilation, Messrs. Robert Boyle & Son's latest improved patent self-acting air-pump ventilator being used for the extraction of the vitiated air.

THE new schools, St. Clare's Convent, Pantasaph, for which Mr. E. Kirby, of Liverpool, is the architect, are warmed and ventilated by means of the patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester and London.

A NUMBER of steel castings, weighing as much as 3½ tons, have been broken up on Messrs. Goodwin's steel foundry, Ardrossan, by means of blasting gelatine. After five fruitless attempts with dynamite on the largest casting, gelatine was used, and the casting was shattered to atoms without causing any serious damage.

A COMPANY is being formed in Aberdeen for the prosecution of the oatmeal milling business. The promoters have arranged to take up and carry on the mills at Montgarrie,

Alford, and contemplate the erection of a new mill of most improved construction on reclaimed ground at Aberdeen, adjoining Caledonian Railway Station.

A STRIKE of workmen employed at Palmer's Steel Works, Jarrow, for an advance of wages has been settled by the parties consenting to refer the matter in dispute to a board of conciliation.

THE church of St. Margaret Pattens, Rood Lane, has been closed for some little time, and Messrs. Cox, Edgley & Co., Limited, of 24 Gray's Inn Road, London, have carried out various alterations, carving, and decorative work in the chancel. This firm has for some little time been formed into a limited liability company. Much high-class work has been entrusted to the company by various architects, and from the satisfactory nature of the work there is little doubt that many other commissions will follow.

THE total tonnage of steelwork manufactured for the Forth Bridge is now 42,667 tons. Including the approach viaduct girders, about 34,500 tons have been erected.

MR. J. W. BARRY, C.E., has been nominated as engineer to conduct the inquiry agreed upon by the Thames Conservators and the Richmond Select Vestry and Twickenham Local Board with regard to the state of the Thames below Teddington and the measures to be adopted for its improvement.

IT was announced in Birmingham on Wednesday that the Army Stores Commission has revived the project of forming a central arsenal on Cannock Chase. The plans prepared in 1871, which presupposed the removal of the arsenal at Woolwich, showed a strongly-walled enclosure, six miles long by four miles broad, with nineteen detached forts.

THE trustees of the late Sir Joseph Whitworth have intimated to the Openshaw Local Board their intention of erecting fully-equipped public baths for the benefit of the inhabitants of the district, and of making a substantial contribution to the cost of a scheme for providing the township with recreation-grounds.

A LANDSLIP occurred near Northwich on Tuesday night. A shaft-like sinking, five yards in diameter, and of unascertained depth, was formed in the bed of Marston Forge Brook, and the brook disappeared. The sewerage system of the neighbourhood was destroyed.

THE City and Guilds of London Institute has issued its report of the result of the tenth examination in technology. There has again been a large increase in the total number of

candidates examined. In 1887, 5,508 were examined, of whom 3,090 passed; in 1888, 6,166 were examined, of whom 3,510 passed. Examinations have been held this year in 49 different subjects. The increase in the number of candidates has been most marked in cloth, cotton, linen, and jute manufacture, in plumberwork, carriage building, carpentry and joinery, and in brickwork and masonry. The practical examinations were held at 13 provincial and four London centres, but all the work executed by the candidates was forwarded to London for inspection.

At the meeting of the Yarmouth Town Council, the Town Hall Restoration Committee submitted the borough accountant's statement of expenditure:—

	£	s.	d.
1886—On account of settlement and dry rot .	597	5	1
1887—Sir Joseph Bazalgette's scheme of under-pinning .	2,720	17	7
1887-88—Messrs. Duckham & Teasdel to March 25 .	7,325	12	1
„ Amount expended since March 25 to present time .	2,024	9	1
	£12,668	3	10

It was stated that the expense of 30% had been incurred in the purchase of wood blocks for paving in front of the hall, and that a further sum of 30% would be required to be spent by the Council in fixing the flag-staff on the roof of the Sessions Court, in the drainage of the basement, and in colouring and tinting the walls and ceilings of the large hall, courts, offices, and corridors. The Council had received, on account of the dry rot in the hall, 287% 13s. 6d., and from the sale of materials used in the restoration (including the engines purchased for Sir Joseph Bazalgette's scheme), 415% 14s. 1d., making in all 703% 7s. 7d. This sum would be a set off against the two years' rents of the hall lost during the restoration, and estimated at about 800%.

A SCAFFOLDER, Miles Hillery, of Parson's Green, in the service of Messrs. Bywater & Co., contractors for the rebuilding of 185 Piccadilly, met with his death on the 15th inst. At the inquest, held by Mr. H. E. Barnes at St. George's Hospital, it was stated by a witness that the deceased was engaged on the same works. He was a skilled hand, and had held his situation for some six or seven years. Shortly before eight o'clock on Tuesday evening, witness, the deceased, and two other men were occupied in raising from the ground an iron joist, weighing about 9 cwt., which was to be placed between

two party walls to support a floor. They were standing on a scaffold composed of five boards each 10 inches wide, but there was no guard-rail or other protection for the men beyond one of the scaffold boards, which was turned up on end. The joist was being raised by means of a jib worked by manual labour, and it was required at a height of 40 feet from the basement. As it approached the scaffold it swerved round, but witness did not think it struck the deceased, although something caused him to fall. It was explained that the scaffold was properly constructed, and that if the usual guard-rail had been provided it would have been impossible to raise the joist. A large amount of technical evidence was given, but in returning a verdict of "Accidental Death" the jury expressed an opinion that the scaffold should have been better protected.

#### LOCAL GOVERNMENT ACT.

THE following regulations for bicycles, &c., under the Local Government Act will be of interest to the members of the Architectural Association Cycling Club:—

(1) The provisions of section 26, subsection 5, of the Highways and Locomotives (Amendment) Act, 1878, and section 23, subsection 1, of the Municipal Corporations Act, 1882, in so far as it gives power to the council to make by-laws regulating the use of carriages herein referred to, and all other provisions of any public or private Acts, in so far as they give power to any local authority to make by-laws for regulating the use of bicycles, tricycles, velocipedes, and other similar machines, are hereby repealed, and bicycles, tricycles, velocipedes, and other similar machines are hereby declared to be carriages within the meaning of the Highway Acts; and the following additional regulations shall be observed by any person or persons riding or being upon such carriage:—

(a) During the period between one hour after sunset and one hour before sunrise, every person riding or being upon such carriage shall carry attached to the carriage a lamp, which shall be so constructed and placed as to exhibit a light in the direction in which he is proceeding, and so lighted and kept lighted as to afford adequate means of signalling the approach or position of the carriage.

(b) Upon overtaking any cart or carriage, or any horse, mule, or other beast of burden, or any foot passenger, being on or proceeding along the carriageway, every such person shall within a reasonable distance from and before passing such cart

(2) Any person summarily convicted of offending against the regulations made by this section shall for each and every such offence forfeit and pay any sum not exceeding forty shillings.

#### AN ARBITRATION CASE.

AN arbitration between the Edinburgh and Leith Corporations' Gas Commissioners and the two Gas Companies has just taken place, and the award of Mr. G. Livesey, C.E., the sole arbitrator, has just been presented. At the hearing, Mr. Blair, W.S., with Mr. Watson, the manager and treasurer, represented the Edinburgh Company. The Leith Company were represented by Mr. William Duncan, S.S.C., and Mr. Linton, their former manager and engineer. The two chief points in the dispute were—(1) What were the implements which had to be specially paid for under the Act; and (2) what was the sum to be paid for the stock of coals which the companies respectively had to hand over. In regard to the former, which was regulated by clause 20 of the Act, the agents for the Companies contended that the expression "implements in store or in hand" was to be construed as meaning any and every implement in their possession. Hence the claim embraced a charge for all movable property in their possession, including every wheelbarrow, shovel, railway carriage, donkey-engine, office furniture, tables, chairs and even the pins on the wall for hanging up hats and coats. Mr. Beveridge, Parliamentary solicitor, on the other hand, contended that the Commissioners had bought a going business, and that in the purchase price by way of annuities, and the lump sums of 27,000*l.* and 11,000*l.* respectively, all the implements that were in use for the manufacture and supply of gas, not only as at present, but as were required at the period of winter when the greatest amount of gas was manufactured and sold were included. He contended that all the Commissioners had to pay for was any stock of implements held in reserve for future use and which had not as yet been used. In regard to the latter, the price of the stock of coals, it would appear that the Edinburgh Company had already paid for a large stock of superior coal, which has gone down in price by 6*s.* per ton. The company contended that they were

entitled to be paid the amount they had expended, seeing that the Commissioners had taken over all their contracts. The Commissioners, on the other hand, held that they were only bound to pay, according to the agreement, the "value" of such stocks at the time of vesting. The award lays down "that no item or article is to be valued and paid for which was used or required for the efficient working of the respective undertakings at their maximum production of last winter, and that only those stores of materials referred to in section 20 of the Act, and all implements, meters, and pipes in store or in hand—whether new, or unused, or not—which are in excess of the quantities of materials, implements, meters, and pipes which were required at the aforesaid period of maximum working, are to be valued and paid for, as provided in the Act."

The effect of this decision will practically be a reduction of the claims of the Companies by upwards of 5,000*l.* In carrying out the decision the lists of both Companies were then gone through, and the various articles disallowed were withdrawn. The arbiter and the parties' representatives thereafter proceeded to the works to value the stores to be paid for.

The arbiter then proceeded to adjust the various claims agreeably with his award, and visited the various works for the purpose of examining the implements and stocks, which have to be paid for by the Commissioners, in order to attach a value to the same. The arbiter fixed the price of the unused gas in the gas-holders and pipes as on August 1 at 2*s.* 6*d.* per 1,000 feet. The valuation of the coal in store or in hand is to be made at the contract price.

#### MANUFACTURE OF STEEL.

A PAPER on manganese steel was read by Mr. R. A. Hadfield, on Tuesday, at the meeting of the Iron and Steel Institute, at Glasgow, on Tuesday. The chief drawback at present commercially is its extreme hardness, equalling that of chilled iron, and the consequent difficulty of tooling it. This difficulty possibly might with more experience be overcome. It was not so liable to honeycombs as ordinary steel, and the addition of silicon was unnecessary. It was manufactured by any of the ordinary steel-making processes, and the ferro-manganese was added in a molten state. An important use of the material was its application for wheels to compete with those made of chilled iron in America and elsewhere. They had already been used

with satisfactory results. On the Nottingham Tramways a set ran over 30,000 miles under severe conditions, the gradients averaging as much as 1 in 18 for about one-half the route of the daily journey. Cast-iron wheels are liable to slip when going down an incline, but the chilled brake-blocks bite much more effectively on manganese wheels, enabling the car to be stopped sooner. The Chester Tramways Company had a set running for over two years, which up till now have run over 45,000 miles, and are not yet worn out. Wheels of this description can be tested with more than one hundred blows with a heavy sledge-hammer without fracture occurring, and at the same time the tyre is so hard that a chisel will not touch it. A set put to work in America has already run 200,000 miles, under heavy engines of the consolidation type, on the New York and New England Railroad. The life of ordinary chilled iron wheels did not average more than 50,000 miles.

#### NATURAL GAS IN OHIO.

AN investigation of the natural gas springs at Findlay, in the State of Ohio, has been made by a German, Dr. E. Wiesenbauer, of Heidelberg University. He is of opinion that the extent of those gas springs has been much underrated, and that at a considerable depth below the township of Findlay, there is an immense cave filled with gas which might easily explode. The professor made use of a shaft through which the gas rises to the surface, in order to connect a very sensitive telephone apparatus with the solid strata lying beneath the gas receptacles, and he came to the conclusion that a more or less solid non-conducting mass, about a mile in thickness, is interposed between the huge gas cave and a glowing furnace. At first he could not credit what the indications pointed to, but a protracted investigation carried on at various points within a radius of three miles has convinced him of the fact. He believes that the heat of this subterranean furnace is 3,500 degs. The upper portion of the strata interposed between this furnace and the cavern where the gases are stowed consists of solid rock of great depth; beneath this is a deep layer of breccia and gravel, below which is another series of strata of solid rock, the lowest layers of which are being slowly eaten away by the terrible fire. The cave he considers to be probably much larger than the great Mammoth cave in Kentucky, and to be in some places fully half a mile deep. He believes that its average distance from the surface is about 1,200 feet, and that

it is even less beneath the town of Findlay. Grave doubt, however, as to the correctness of the conclusions or observations of Dr. Wiesenbauer is entertained.

#### FORESHORE RIGHTS AT BRIGHTON.

A DISPUTE has just been settled between the Crown and the Brighton Corporation in regard of certain rights over the foreshore. The Commissioners of Woods and Forests had made a claim over the foreshore between the existing high and low marks of ordinary spring tides, and also an interest in land which, although above the existing high-water mark, lies seaward of the high-water mark of 1861. In other words, they made a claim over those portions of the foreshore which had been accreted by the erection of sea-defences. The latter claim was resisted, and the Crown began an action against the Corporation, but negotiations have been going on, with the result that the Commissioners have abandoned the claim to the accreted foreshore, and have further agreed to sell to the Corporation all the Crown's interest in the entire foreshore of Brighton, with the necessary exceptions of the land covered by the Chain Pier, and that sold to the West Pier and Aquarium companies. The consideration money is to be 525%, with 30% to cover the fee of the Crown Surveyor and the office charges for the Crown conveyance. Hitherto the Corporation have been paying an annual rental of 10%, besides royalties, which in one year amounted to 300%. The Town Council have unanimously accepted these terms.

#### CLAIMS FOR PROFESSIONAL WORK.

At the meeting of the Glasgow District Board of Lunacy on Wednesday last week, the claims by Messrs. Bruce & Hay, architects to the Board, and Mr. John Dansken, measurer, for work done in connection with the abandoned asylum project at Hartwood, came up for consideration, and the Board resolved on the recommendation of the Finance Committee to settle them for 2,375% and 1,199% 15s. respectively, as against 3,000% and 2,000% originally charged. A conference was held with Messrs. Bruce & Hay on the 12th ult., but those gentlemen left the meeting without any understanding being arrived at, as they did not indicate their willingness to reduce the amount of their claim to such a sum as the sub-committee would feel

## THE FIRE AT THE GRAND THEATRE.

The destruction of this fine Building might have been PREVENTED by the USE of GRIFFITHS' "PYRODENE," which would have made the WHOLE of the SCENERY, STAGE, and its SURROUNDINGS—in fact, THE THEATRE in every part—ABSOLUTELY NON-INFLAMMABLE.

### GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

### GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE. NON-POISONOUS. ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRs.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 33 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRs.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

warranted in recommending should be paid. The sub-committee therefore unanimously agreed to recommend that the former offer of 2,000*l.* should be adhered to. At a subsequent meeting of the committee on the 30th ult., the chairman, Sir James King, explained that since the previous meeting he had had a call from Messrs. Bruce & Hay, who, after conversation on the subject, ultimately expressed themselves as satisfied to accept, if offered to them, the sum of 2,375*l.* in full settlement of their claims. The meeting, having fully considered the matter, unanimously resolved to recommend that the sum of 2,375*l.* sterling be paid to Messrs. Bruce & Hay in full settlement of their claims, on condition that they deliver up to the Board the plans of the proposed asylum, and the whole papers connected with the work done by them for the Board. Mr. Dansken was not present at the former of the two meetings, and the sub-committee ultimately resolved to recommend that his proposal to enter into a reference should not be agreed to, but that the offer of 1,094*l.* 15*s.* in all, formerly made to him, should be adhered to. At the latter meeting the clerk submitted correspondence which had passed between Mr. Dansken and him since last meeting, resulting in Mr. Dansken stating that he would be glad again to meet the sub-committee. The chairman reported that, having happened to meet Mr. Dansken, a conversation had taken place on the subject of his claim, which brought about a statement by Mr. Dansken to the effect that he would be willing to accept, if offered, the sum of 1,175*l.*, with, in addition, the amount of the account incurred to him, as to which there was no dispute, being 24*l.* 15*s.*, and amounting together to 1,199*l.* 15*s.* sterling. The meeting, having taken the matter into consideration, unanimously resolved to recommend that the sum of 1,199*l.* 15*s.* be paid to Mr. Dansken, in full settlement of his claims. The Finance Committee, at a meeting on August 8, approved of the compromise, and recommended the Board to settle with the architects and measurer on the terms stated.

Councillor Paton said the most important matter in the minutes was the settlement which had been effected with the architects and the measurer. The negotiations, he said, had been to some extent of a delicate character, but they had been carried out with the best feeling, both on the part of the Board and the claimants. No doubt the sums stated would appear to the Board to be very considerable sums of money. However, after going very carefully into the matter, and having a great deal to do in bringing this matter to a conclusion, he was satisfied if the Board went into litigation, large as the sums

might appear, they might have to pay more. He had no hesitation in saying that for the work done they were making a fair and reasonable bargain with both of the parties interested, and consequently for himself he could recommend that the Board adopt this settlement. Both the architects and the measurer were exceedingly anxious in coming to this settlement to couple it with a kind of *quasi* condition that the Board should recommend them to their successors for any work to be done in the future. Of course the Board could not do that, but he thought both Messrs. Bruce & Hay and Mr. Dansken had done their work remarkably well. Messrs. Bruce & Hay's plans for the large asylum at Hartwood were such as met the approval of everybody connected with the Board. The General Board of Lunacy were satisfied with them; the District Board were well satisfied with them, and had it been the policy of the Board to go on with the work, the plans were simply admirable. Mr. Dansken had a very large amount of work in connection with the measuring for three sets of plans. That work he did with great expedition; it was done very carefully, and he (Mr. Paton) believed it gave very great satisfaction to the gentlemen connected with the Board. He hoped that if, at some future time, their successors should require similar work, the claims of the gentlemen of whom he was speaking would be taken into consideration by the gentlemen who formed the Board of that day.

The minute was then passed.

#### PURIFICATION OF THE RIVER THAMES.

REFERRING to the proceedings of the Royal Commission on the Metropolitan Board of Works on the 14th inst., Mr. J. Bailey Denton writes to the *Times* of Monday as follows:—

"Colonel Jones, V.C., in his evidence before Lord Herschell and his colleagues, having represented that I had acted in concert with him in preferring charges against the Metropolitan Board of Works, to the effect that the Board had never given the recommendations of Lord Bramwell's Commission any serious trial, but had plunged into experiments of their own, allow me to emphasise the opinion that the permanent works of the Royal Commission which Sir Henry Roscoe declares 'will have to be adopted,' will involve a less charge upon the rate-payers of London than the experiments of the Board, which the same high authority has asserted 'will not prevent a foul

### IMPORTANT COMMUNICATION. — WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed)

WILLIAM WHITELEY.

condition of the river.' The permanent works recommended by the Royal Commission, on the contrary, would not only free the river from pollution, but would afford facilities for the utilisation of the sewage at a future time, when the examples of Paris and Berlin have had their influence upon the authorities of London, and the twofold nuisance attending the tank works at the outfalls and the sending of the sewage to sea has made itself felt."

The evidence referred to in the letter is as follows :—

Colonel Jones, V.C., said he was a partner with Mr. Bailey Denton, and on May 4 he sent in a memorial to the Commission containing precise charges against the Board with reference to the London sewage. The Board had taken no complete steps to ascertain what the probable cost of the permanent recommendations made by Lord Bramwell's Royal Commission would amount to before they rushed into very high experimental costs for attempting to avoid the permanent remedy. Witness and his partner had been endeavouring for years to show what the cost of those remedies would be, and the cost was less than estimated by Sir Joseph Bazalgette. Therefore witness complained that the Board had not ascertained the cost.

Lord Herschell : But the suggestion is that further information and experiments since the date of that Commission have produced results showing that it was worth while to try some other course before going into the expenditure of two millions. This question of the disposal of the sewage is a question on which there is great difference of opinion. My experience is that no two people are agreed as to what system is good and what system is bad.

Colonel Jones : I admit all that, but I maintain that the scientific Royal Commission investigated the thing fully, and their conclusions have been thwarted.

Mr. Bosanquet : Do you say that they could have used precipitation as a means of getting rid of the sewage without these great permanent works ?

Colonel Jones : Certainly ; I am perfectly satisfied of it.

Sir Joseph Bazalgette was recalled, and stated that the course pursued by the Board for the disposal of the London sewage was the right one. If they had undertaken the permanent works suggested at a cost of four millions sterling it would have enormously increased the rates, and there would have been a revolution in London. What the Royal Commission estimated would cost 200,000*l.* a year the Board were now doing for 76,000*l.* a year ; and that was the result of careful experiments.

Several witnesses were called as to the way in which the Board's sewage works were done ; and they all vouched that they had been creditably done.

#### CAPE TOWN SEWERAGE.

THE municipality of Cape Town has had considerable difficulty in dealing with the sewage of that city, and although the cost of the sewage-disposing works must be of an enormous magnitude, nothing yet appears to have been done to permanently remove the difficulties which at present exist. Numerous proposals have been considered ; but, finally, the authorities have retained the services of Mr. Edward Pritchard, M.Inst.C.E., of London and Birmingham, to make a personal inspection of the district, and prepare a comprehensive report thereon, and he has just left England for the Cape for this purpose.

#### SHIP CANALS.

THE project of a maritime ship canal to connect Bristol with the English Channel is being revived. This plan has found favour among many of those interested in mercantile and commercial pursuits, and the feasibility of the suggested undertaking has been favourably reported on by engineers. It is proposed to construct a ship canal from Bridgwater Bay, commencing at Stolford, on the Somerset coast, *viâ* Taunton, and terminating at Seaton on the South Devon coast. The length of the proposed canal will be 45 miles, and it is proposed to make it of sufficient capacity for vessels of the largest tonnage. The great recommendation of this proposed connection of the Bristol and English Channels is that it will effect a saving of nearly 300 miles, its main object being to get rid of the necessity for ships plying from the Bristol Channel to the English Channel ports, the Continent, and the Baltic, &c., being compelled as they are now to go round the Land's End, the Lizard, and past the Cornish and North Devon coast. It is also suggested that Stolford and Seaton, at either end of the proposed canal, could be converted into efficient harbours of refuge. The cost of construction is at present roughly estimated at 70,000*l.* per mile.

During the past month the Sheffield Chamber of Commerce has also taken up the question of water communication between

Sheffield and the coast. The heavy railway charges seriously hamper many local industries, in addition to which some of the larger steel productions of the district do not easily adapt themselves to railway carriage. A rough inspection of the waterways between Sheffield and Goole has already been made, and a committee appointed to consider the subject and ascertain in what way water communication can best be improved so as to afford cheap water carriage for the district. The committee includes manufacturers, landowners, and coalowners.

### SHAKESPEARE THEATRE, LIVERPOOL.

THIS theatre has been erected from the designs of Mr. J. H. H. Sutton, and is capable of holding 3,000 persons, and in the construction everything that could be planned to secure safety has been carried out by means of Try's patent. The doors are under the control of a man in the attendant's box, who by pressing a lever opens all the doors in the building at once, the apparatus used fastening them, when once opened, securely back. The fireproof curtain that separates the stage from the auditorium, although weighing five tons, is lowered and raised in a few minutes by hydraulic pressure. Over the stage a network of two-inch pipes, supplied with water by a special main, will flood the building in case of fire. More than 1,000 tons of iron and concrete, it is calculated, have been used in the building of the theatre.

### ARTISTIC WALL-PAPERS.

SPECIMENS of the artistic wall-papers of Messrs. William Woollams & Co., of 110 High Street, near Manchester Square, London, W.C., so well known for their beauty and sanitary qualities in the entire freedom from arsenical matter in the manufacture, are shown at the Irish Exhibition, Olympia, at Stand D 219, and E 241. At the invitation of the Council Messrs. Wm. Woollams & Co. were pleased to be able to show, in the fixed specimens, the designs of an Irish artist, Mr. A. F. Brophy, of Limerick, whose name is well known in artistic circles. The principal work exhibited is a dado decoration, in Adam's style, called the "Savoy." It is printed in terra-cotta, No. 2927, facing Avenue D, and in blue, No. 4104, facing Avenue E. On either side of the Avenue D, front

of their stand is another dado decoration, Venetian in type, named the "Goldsmith," which is worked in blues, No. S 445, and in yellows, No. S 446; while the sides of the Stand in Avenue E are occupied by eighteen different colourings of an all over well balanced Damask pattern called the "Redcliffe," amongst which No. G 993 in yellows, and No. S 383 in blues, are particularly successful. Although Mr. Brophy is now well known as the head master of the art department of the Finsbury Technical College, connected with the City and Guilds of London Institute, it is not so well known that he is an Irishman by birth. He was a student of the Limerick School of Art, and gained the only National medal awarded in art to Limerick in 1860. Subsequently in London he gained the gold medal for furniture, and the architectural gold medal, and he is one of the examiners of national competition and third grade certificate work at the Science and Art Department, South Kensington Museum.

### MOVABLE WOODEN CHURCHES.

THE second edition of a brochure on the advantages to be derived by the adoption of movable wooden churches for temporary purposes instead of the ordinary iron ones, by Mr. William Jeffrey Hopkins, F.R.I.B.A., consulting architect to the Church Extension Society for the Archdeaconry of Worcester, has been published. From it the following extracts are taken:—

Wherever the population of a district suddenly and rapidly increases, it becomes of the utmost importance that temporary churches or mission-houses should be erected. The necessity for erecting such structures is so generally admitted, and the amount expended on them is so large, that it has long appeared a matter of great surprise to me that so very little thought has been bestowed either upon their construction or the best method of rendering them as effective as possible for the great and good purpose for which they are intended. I have, therefore, devoted much time and thought to this subject, and carefully considered what is required and what we should endeavour to attain in designs for such temporary structures, so that the greatest possible advantage may be obtained from them. I have also considered to what extent the present iron structures, so universally adopted, meet these requirements, and to what extent they are deficient, and further, whether wood may not be

J. R. GOTZ,

19 BUCKINGHAM ST., STRAND, LONDON.

advantageously substituted for iron in the construction of such buildings. To satisfy myself with regard to these matters, I have drawn out a design and prepared a specification for a movable wooden church, and obtained an estimate from a very trustworthy and experienced builder, showing the amount for which he is prepared to carry out that design in accordance with the plans and specifications.

There can be no doubt that the most essential requirements for such temporary structures are cheapness and comfort. It is not to be supposed that those you are endeavouring to draw to join in the services will expose themselves in winter to the coldness and draughts of the ordinary iron churches now in use, or to the intolerable close, heated atmosphere during the summer months. Even the manufacturers themselves are so fully aware of this defect of their material, that they advise their being lined with wood. Therefore a certain amount of comfort, combined with cheapness, should be considered indispensable. The supposed cheapness of iron buildings, and that alone, has secured their adoption up to the present time, and has been considered to atone for all their demerits. Yet buildings comparatively deficient in comfort, even although the cost may be a trifle less, can scarcely be considered really economical, for the deficiency tends to frustrate the object in view.

In my plans and specifications I have shown the walls to be double-boarded, and the interspaces filled with sawdust. Wood being a non-conductor compared with iron, at once insures greater coolness in the hot summer months, and greater warmth in the winter, and the interspaces being filled up with sawdust the walls become impervious to all draughts. Again, for the iron roof, which in the cheaper kind of iron churches tends much to their notorious discomfort, is substituted a wooden asphalted and slated roof—though possibly instead of slate the new patent paper material may be found still more desirable. Then again for the ordinary cheap flooring, seldom properly seasoned or tongued, I have substituted wood-block flooring, at once insuring the greatest warmth and preventing all draughts to the feet. The plan shows a building containing 1,440 superficial feet, and capable of holding 200 adults. The estimate for it is 270*l.*, to which I have added 54*l.* for chairs and other contingencies, making the cost 324*l.*, or 4*s.* 6*d.* per foot superficial.

As to the greater facility of the erection and removal of wooden over iron buildings, Mr. Hopkins says:—Every timber and every board is either disunited or capable of being dis-

united and reunited with great ease and at little cost. Every bay is designed and constructed alike, and there is nothing to prevent the removal of the whole or a part whenever desired. The whole is capable of dismemberment. The great advantages of this method of construction for temporary chapels, so far as I am aware, has never been realised. Yet how desirable it would be if the pieces of which a temporary church is composed could always be kept ready to be put together, and if the ground upon which it is to be erected could be prepared ready for its reception any day, and the building constructed in a tenth part of the time required for that of an ordinary iron church. Also if, when erected, by the simple process of taking down the west end and extending it westward by the addition of another bay or bays, the building could be enlarged to any extent required. Besides, when no longer required upon one site it could be removed to another without material injury, and without the loss and expense at present incurred on such occasions. Further, instead of its being possibly sold by auction for some secular purpose, it could simply be used again, and that over and over again, for the same good purpose. Its removal, if so constructed, would cause very slight, if any, injury to the several parts; and this great advantage should be duly weighed in considering the relative cost of it with that of an iron church.

#### PLUMBING REGULATIONS IN NEW YORK.

(Concluded from last week.)

##### VI.—UPRIGHT SOIL, WASTE, VENT, AND DRAIN-PIPES.

*Soil-Pipes.*—For each water-closet or line of water-closets and adjacent fixtures, as shown on plans, provide and set ... inch extra heavy cast-iron soil-pipe, connecting with the house-drain by a Y-branch and one-eighth or one-sixteenth bend, and extending 2 feet or more above the highest part of the roof or coping; said pipe will be increased to ... inches in diameter from the roof upward. If near a light shaft or other ventilating opening extend the soil-pipe ... feet above it. The soil-pipe to have ... inch ... Y-branches, to receive the traps of the water-closets on each floor, and ... inch ... Y-branches for the traps of ..... as shown on the accompanying plans.

*Waste-Pipes.*—Provide and set, with proper connections for each basin, bath, sink, urinal, wash-tub, or tier of same, where shown on plans ..... inch extra heavy cast-iron waste-pipe, connecting with the house-drain, and terminating above the

roof in the same manner as soil-pipe, said waste-pipe to be increased to ..... inches in diameter from the roof upward. The waste-pipe to have ..... inch ... Y-branches on each floor; and each of the set fixtures where shown on plans to be connected therewith by short lengths of ... inch lead pipe, with ..... inch traps as specified in detail under fixtures.

**Vent-Pipes for Water-Closet Traps.**—Set for all water-closets and ..... as shown on plans ..... inch extra heavy cast-iron vent-pipe, connecting by branch lead pipes not less than ..... inches in diameter, with the crown of each water-closet trap, and ..... inches in diameter for ..... traps. Extend the main vent-pipe above the roof separately, as specified for soil-pipe, and enlarge it to 4 inches in diameter from the roof upward. Said vent-pipe to have ..... inch T-branches on each floor.

**Vent-Pipes for other Traps.**—Set for traps of all other fixtures, as shown on plans ..... inch extra heavy cast-iron vent-pipe, connected by a branch lead pipe ..... inches in diameter, with the crown of each trap. Extend the main vent-pipe above the roof separately, as specified for soil-pipes; said pipe to be enlarged to 4 inches in diameter from the roof upward. Said vent-pipes to have ..... inch ..... T-branches on each floor. There will be ..... soil ..... waste ..... vent-pipes extended above the roof of each building. The arrangement of all pipes throughout the building will be as direct as possible, and all unnecessary effects must be avoided. Grade all vent-pipes so as to discharge water collected by condensation. The bowing of vent-pipes must be avoided. Whenever practicable all pipes and traps will be left so that they may at all times be readily examined and repaired. Where they are necessarily placed in partitions or recesses in walls, they will be covered with face-boards, which will be fastened with screws, so as to be readily removed. All main soil, waste, and vent-pipes will have a diameter above the roof at least 1 inch greater than that of the pipe proper, but in no case will it be less than 4 inches above the roof. No caps, cowls, or bends will be affixed to the tops of such pipes, but in tenement houses the opening of each will be protected by a strong wire basket securely fastened thereto. All pipes above an extension roof will be extended above the roof of the main building when otherwise they would open within 20 feet of the windows of the main building or of an adjoining building. The joints between all pipes and the roof will be made watertight by heavy sheet lead flashings or .....

**Roof Drainage.**—The ..... will provide ..... leader outside

the house of galvanised sheet iron ... inches in diameter, and the plumber will connect same with the house-drain by a ... inch extra heavy cast-iron pipe, extending ... feet above ..... level and a ... inch extra heavy cast-iron running-trap so placed beneath the ground or inside the cellar wall as to prevent freezing. The ..... will provide ..... leader inside the house of extra heavy cast-iron ... inches in diameter with the joints calked with lead, in same manner as the soil-pipe, to be trapped at the base, if it opens near a ventilating shaft or window, and the plumber will make the joint between said leader and the roof by means of a brass ferrule and lead or copper tube properly connected. When there is no sewer connection the ..... will connect the leader above specified by ... inch ..... with the street gutter or .....

**Safes and Safe Waste-Pipes.**—Underline all ..... with sheet lead of ... pounds per foot, with edges turned up at least ... inches, in a secure manner, to prevent overflow. Connect all safes with a ... inch ..... pipe, discharging either into an open sink, or upon the cellar floor, as the architect may direct. The branch pipe from each safe to the main safe waste will be ... inch ..... pipe.

**Refrigerator Waste-Pipes.**—Line the spaces shown on plans and as prepared by carpenter with ..... pound sheet lead, and connect each by a ... inch ..... branch pipe with a special line of refrigerator waste-pipe. Said pipe to be ... inch ..... pipe, so arranged as to discharge over a properly trapped and Croton-supplied sink, in ..... so placed as to be convenient for ordinary use, and with the end of the pipe covered by ..... In tenement houses the refrigerator waste-pipe will be extended 2 feet above the roof. Provide over each outlet of the safe waste-pipes, and of each outlet from the refrigerator waste-pipes a strong metallic strainer. In no case will a refrigerator or safe waste-pipe be connected directly with the house-drain or sewer, or with any pipe which connects with the house-drain or sewer. There will be ... lines of refrigerator waste-pipes and ... lines of safe waste-pipes in each building.

#### VII.—TRAPS.

Trap every water-closet, urinal, sink, basin, bath, and every wash-tub or set of tubs, and all other sewer-connected fixtures effectively in the manner shown on the plans. The traps to be as near the fixtures as practicable. The traps will be so arranged that in no instance will the waste from a fixture pass through more than one trap before entering the house-drain. All traps will be of the same weight and thickness as their

#### VIII.—WATER-CLOSET CISTERNS.

The ..... will put up over each water-closet a ... cistern, ..... by ..... by ....., and the plumber will connect the same with the supply pipes by ... inch ..... lead pipe, and with closet bowl by ... inch ..... lead pipe arranged for the proper flushing of the closet, and leave the whole in complete working order, with the necessary chain and pull or ..... In no case will a water-closet within the building be flushed directly from the Croton-supply pipes, and the water from cisterns which supply water-closets directly will be used for no other purpose. Where water does not rise to water-closet cisterns they will be supplied from a house-tank, or pumps will be provided to properly supply the same; said pumps to be so placed, arranged, and connected as to enable tenants using the water-closets to conveniently secure at all times a proper flush for each of said water-closets. Discharge the overflow-pipe from each water-closet cistern into the bowl of the water-closet. In no case will it discharge into the soil or waste-pipe or into the drain or sewer.

#### IX.—HOUSE SUPPLY-TANK.

Provide and set on ..... a tank for drinking-water, to hold ... gallons, lined with ....., and constructed of ..... Make all necessary connections with supply and house-pipes as specified under Water-Supply Pipes. Provide a ..... inch overflow pipe and a ..... inch emptying pipe, each to be discharged as follows : ..... Provide a ..... tell-tale pipe and ..... The discharge or emptying and overflow pipes will not be connected in any way with any soil, waste, vent, or drain-pipe.

*Pumps.*—If the pressure of the Croton be found to be insufficient to supply any fixture, or any water-closet tank, provide and set up a ..... pump, to supply house-tank or ..... pumps for each ....., and make all necessary connections as specified in detail under Water-Supply Pipes.

#### X.—NUMBER, LOCATION, AND DESCRIPTION OF FIXTURES.

Supply and set up in complete working order the following fixtures of the pattern and kind hereinafter described; the exit-pipes to wash-basins, bath-tubs, wash-tubs, and sinks to be provided with strong metallic strainers; ..... water-closets, ..... urinals, ... wash-basins, ..... bath-tubs, ..... wash-tubs, ..... sinks, ..... pumps, ..... refrigerators, ... boilers, ..... ranges, located as follows : .....

#### XI.—WATER-SUPPLY PIPES.

The plumber will grade each line of supply-pipe, so that it can be completely emptied at its lowest point. Water-pipes in exposed places will be packed by the ..... with mineral wool, or other substance equally good, to prevent freezing, and will be properly boxed and cased to the satisfaction of the Board of Health. The ..... will excavate for and the ..... will insert ... inch tap in street main, if necessary. The plumber will connect tap and house supply at point indicated on the plans by ... inch ..... lead pipe, to weigh ..... per foot, to be laid ... feet below the curb level. Also place a stop-cock at ..... to shut off the water when necessary. Description of quality, diameter, and weight of supply-pipes to fixtures .....

#### XII.—GAS-FITTING.

(Signature of owner.)

#### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

11529. Will Towle and William Edmund Langdon, for "Improvements in electric lighting." August 10, 1888.  
11532. Patrick Mooney, for "An improved syphon apparatus for water-closets." August 10, 1888.  
11536. Will Verity, for "Improvements in means for opening window-sashes." August 10, 1888.  
11538. Thos. Edw. Lane, for "A new or improved wooden roof." August 10, 1888.

# KALLKOLITH.

## NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN  
England,  
Belgium,  
France,  
Germany,  
Italy.

TRADE MARK.

PATENTED IN  
Austria-  
Hungary,  
Denmark,  
United  
States  
of America.

**KALLKOLITH** is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

**CHEAPNESS.**—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

**ECONOMY** is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

**DRYING POWERS.**—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

**DURABILITY.**—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

**PAPER-HANGING.**—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

#### TESTIMONIALS.

21 New Bridge Street, London, E.C. : February 23, 1886.  
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of coats now given reduced, and, once fairly introduced in the market, I am certain there will be a large sale.  
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W. : Feb. 15, 1887.  
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.  
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—**KALLKOLITH CO., 175 STRAND, LONDON, W.C.**

11609. Walter Jones, for "Improvements in or relating to the means of connecting or fixing lids or covers over manholes and analogous openings in metal cisterns and tanks and like receptacles or holders." August 11, 1888.

11610. Henry Johnson, for "Improvements in bricks for pavements and floors." August 11, 1888.

11709. Newton Brook and Albert Taylor, for "Improvements in the boxes or moulds of machinery for pressing bricks." August 14, 1888.

11715. Francis Philip Wheeler and Wm. Owen Johnson, for "Improved methods and means for instantly removing and replacing window frames, ropes, and weights, for cleaning, repair, and other purposes." August 14, 1888.

11725. James Beard Faucette and Henry Lewis Fletcher, for "Improvements in distance instruments." (Complete specification.) August 14, 1888.

11737. Gustav Binswanger, for "Improvements in electric pushes." August 14, 1888.

11754. Alfred Rolfe, for "A means of escape from houses on fire, by means of an apparatus he calls a jumping-sheet or net." August 15, 1888.

11759. Thomas William Bates, for "Certain improvements in flap ventilators." August 15, 1888.

11775. Reginald Hadden, for "An air purifier and cooler." August 15, 1888.

11777. Peter Francis Vandersteenstraaten, for "An improved manufacture and treatment of compounds as substitutes for ivory, whalebone, indiarubber, varnish, and other substances." August 15, 1888.

11795. James Adams, for "Improvements in check action swing-door hinges and adjustable fittings for the same." August 16, 1888.

11796. Denis O'Halloran, for "Improvements in bell pulls." August 16, 1888.

11803. William Hetherington Nixon, for "An improved lever rack pulley, or apparatus for winding up window-blinds." August 16, 1888.

11814. Benjamin B. Snell, for "A spring catch to be applied to fasteners of sashes, doors, and shutters, which locks cross-bar, and entirely prevents opening from the outside." August 16, 1888.

11823. Arthur Warner, for "Improvements in locks particularly applicable to latch locks." August 16, 1888.

11833. William Henry Betts, for "Improvements in tobacco pipes." August 16, 1888.

11834. Miguel Pinder, for "Improvements in erasers, and

in attaching same to pencils and penholders." (Complete specification.) August 16, 1888.

#### PROVISIONAL APPLICATIONS ACCEPTED.

9360. James Cormack and William Cormack, for "Improvements in ventilators." June 27, 1888.

9460. Charles James Erasmus Kinslow, for "An adjustable mulet gauge for carpenters and joiners." June 28, 1888.

9556. James Holroyd, for "Improvements in the construction of *faience* or glazed terra-cotta mantelpieces, firesides, fronts of grates, and fenders for hearths or firesides, and such like articles." June 30, 1888.

9905. Thomas Barter and Joseph White, for "An improved device for opening and closing fanlights, skylights, the sashes of windows, and the like." July 7, 1888.

9968. William Lindsay, for "Improvements in bridges and other structures." July 9, 1888.

9986. Fred Wilfrid Scott Stokes, for "Improvements in the continuous and economical manufacturing of cement." July 10, 1888.

10149. Stephen Tuddenham, for "Improvements in metal strips for sash bars, also for construction of or strengthening sash or other frames for holding glass." July 12, 1888.

10163. Christian Wraa, for "Improvements in life-saving appliances for rescuing people from high buildings, and other places, in case of fire."

10288. Facharial Pack and James Pack, for "Improvements in brick-moulding machines." July 16, 1888.

10460. William Clark, for "A horizontal condensation bar in combination with an improved metallic sash bar for glass roofs and similar structures." July 19, 1888.

10755. Thomas Guest Normanton, for "Improvements in inlet and outlet ventilators." July 25, 1888.

10842. William Davies, for "Improvements in flushing apparatus, more especially adapted for flushing urinals." July 26, 1888.

11001. Sidney Turner, for "An improved instrument and apparatus for use in the mechanical reproduction of writing, drawing, and other delineations." July 30, 1888.

#### PATENTS SEALED, AUGUST 17, 1888.

10762. William Lewis, for "Improvements in the arrangement and construction of fireclay, terra-cotta or firebrick domestic fireplaces." August 5, 1887.

10764. Frederick Wilfred Scott Stokes, for "Improvements

## Wilson's Patent Dioptrical Pavement Lights.

WILSON & CO. beg to call the attention of Architects and others to the superiority of Wilson's Patent Dioptrical Lenses for pavement and floor lights. These Lenses are constructed on strictly scientific principles, and have been approved by some of the highest authorities on Light. They are made of the Best English White Flint Glass of high refractive power, and transmit more light than any other form of Lens yet introduced. The reflecting surface being spherical, *the rays of light are distributed in every direction.*

Wilson's  
Patent Lenses  
for  
Floor Lights,  
Deck Lights,  
and  
Pavement  
Lights  
of every  
description.  
Sample Lenses  
on  
application.

Wilson's  
Patent Lenses  
for  
Stall Boards,  
Cellar Flaps,  
Ornamental  
Tile & Glass  
Pavements.  
Safety Coal-  
Plates.  
Plans, Prices  
and Estimates  
Free.

Fig. 1 shows how the ordinary prism or semi-prism, by receiving the rays on a plane reflecting surface, throws them forward at one angle only, in parallel lines close to the ceiling.

Fig. 2 represents the Patent Dioptrical Lens, and shows by comparison how the rays of light, striking on the curved inner surface, are reflected forward through the face of the lens in every direction, filling the whole angle of 90°, thus illuminating the apartment from floor to ceiling and from wall to wall.

From the above diagram it will be seen wherein consists the advantages claimed for Wilson's Patent Lenses. The objection to the semi-prism is that it reflects the light, as shown in Fig. 1, at such an angle as to be of little use, and more especially if the line of the ceiling is below the line of the pavement; then the value of the semi-prism as a light projector is entirely lost.

It will be seen also, on reference to the above diagrams, in Fig. 1 that the first row of semi-prisms obstructs the rays of light from each succeeding row, whereas in Fig. 2 the bulk of the rays of light are projected at such angles as to pass unobstructed into the room.

*The correctness of these illustrations can be practically demonstrated to any architect desirous of testing them.*

PRICE LISTS AND ESTIMATES ON APPLICATION TO

WILSON & CO., Bridge House, 181 Queen Victoria Street, London, E.C.

in the methods and apparatus for drying cement, slurry, and the subsequent cooling of the burnt cement." August 5, 1887.

11829. William Robert Crozier, for "An improved locking sash fastener." August 31, 1887.

13342. Robert Platt, for "An improved window sash fastener." October 3, 1887.

14990. John Knight, for "A metallic reversible tread for steps, stairs and manhole covers in roads and pavements." November 3, 1887.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

7702. Geo. Samuel Marshall, for "Improvements in cord-holders for roller and Venetian and other blinds." May 26, 1888.

9733. Elliott Emanuel, for "A double fan for wash-out closets." July 4, 1888.

12341. Edward Kirby, for "Improvements in window fastenings, commonly known as sash or casement fastenings." September 12, 1887.

13902. Robert Punshon, for "Paving, flooring and roofing material." October 13, 1887.

14056. John Edward Beanland, for "A new or improved hinge or connection adapted for either doors, gates or windows and means or method of fixing same." October 17, 1887.

14146. Charles Taylor and George Benjamin Taylor, for "Improvements in chucks for lathes, part of which improvements are also applicable to vices and to cramps." October 18, 1887.

15596. John Wesley MacKnight, for "Improvements in artificial pavement." November 15, 1887.

16234. John Sheldon, for "Improvements in wall ties or band iron." November 25, 1887.

9634. William Lampas Gregg, for "Improvements in the method of and machinery and apparatus for manufacturing bricks." July 3, 1888.

10312. George James Snelus, Thomas Gibb, J. C. Swan, Herbert Smith and William Whamond, for "Improvements in and connected with the manufacture of cements." July 16, 1888.

#### NOTES ON SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in fireproof curtains for theatres, &c." 12817. 1887. Mr. W. H. Clark, architect, John Street, Bedford Row, London. This invention relates chiefly to the use of silicate cotton, slagwool, or such like substances, in combination with wire-netting or sheet metal for forming a fireproof curtain, and the curtain is raised and lowered by means of pulleys and balance weights.

*Claim I.*—The fireproof curtain consisting of a metal frame A B, suitably stayed and filled in with silicate cotton, slagwool, or other equivalent incombustible fibre enclosed between wire net or plain or corrugated sheet metal, or both wire and sheet metal, substantially in the manner described and shown in the drawings.

"Improvements in metallic roofing-plates or shingles." 8808. 1888. H. H. Lake, London. (Communication from J. S. Thorn, Philadelphia, Pennsylvania, U.S.)

*Claim I.*—In a metallic roofing plate or shingle the device of an elevation or struck-up lower edge, terminating in an abrupt downwardly-bent flange, decreasing in depth as it extends from the centre to the edge of the shingle.

"Improvements in fowl-houses, coops, dog-kennels, &c." 12820. 1887. R. R. Fowler, Prebendal Poultry Farm, Aylesbury.

*Claim I.*—In fowl-houses or coops, dog-kennels and the like, making the sides and, if desired, one of the ends to be hinged thereto, and providing same with means for adjusting their position substantially as and for the purpose set forth.

*Claim II.*—The portable house for fowls, dogs, and other animals described and shown.

"Improvements in bricks for wells and such like purposes." 12872. 1887. M. H. Blanchard & Co., Brick and Tile Works, Bishops Waltham, Hants.

*Claim.*—In the manufacturing of bricks to be employed in the construction of wells and the like; the imparting to same in process of manufacture and when in the plastic state the necessary contour or configuration, so as to dispense with the subsequent cutting and trimming substantially as herein set forth.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.
